Among the more important articles in this Volume are the following:

MATTHIAS; MARX...... Thomas Kirkup.
MAMMALS; MAN...... J. Arthur Thomson.
MAN, ISLE OF...... Rev. T. E. Brown.
MANCHESTER..... C. Fairbairn.
MATURE...... John Hunter, F.G.S.
MARLOWE; MARSTON...... A. H. Bulles.
MARRIAGE...... D. Maclean.
MARSTAY...... Walter White.
MARVELL...... John Ormsby.
MART QUENT OF SCOTS...... Joseph Robertson.
MARYLAND; Professor M. A. Newell.
MASSACHUSETTS...... Horace G. W. Mather.
MASTIFF...... Rev. M. W. Wynne.
MATTER...... Professor F. G. Tait.
MATTHEW; MOSES...... Rev. John Sutherland Black.
MAURICE...... Thomas Hughes.
MEASLES...... Dr. Lundie.
MECCA; MEDINA...... Stanley Lane-Poole.
MEDAL; MOSAIC...... James Paton.
MEDICINE...... Dr. J. P. Steele.
MEDITERRANEAN...... Sir John Murray.
MELBOURNE...... J. F. Hogan, M.P.
MENDIP...... H. Whittred.
MEROPTH; GEORGE...... Rev. John S. Black.
METEOROLOGY...... Dr. Buchanan.
METHODISTS...... Rev. T. T. Lamberti.
MEXICO...... W. Dunday Walker.
MICHELANGELO...... Charles Whibley.
MIGRATION...... Dr. Robert Brown.
MILITA...... Light-Colonel Dunlop.
MILL...... Thomas W. Tod.
MILL, JOHN STUART...... Professor Sorley.
MILLAIS; MILLEY...... John M. Gray.
MILLS....... Robert Cochrane.
MILTON...... Richard Garnett, LL.D.
MIHUR...... Edward B. Poultun.
MINIATURE PAINTING...... H. B. Wheatley.
MINING; ORE-DEPOSITS...... Bennett H. Brocom.
MINT...... Eduard Rigo.
MIRABEL; MURSET...... Thomas Davidson.
MISSIONS...... Rev. Prof. Thomas Smith, D.D.
MISSISSIPPI (State)...... J. R. Preston.
MISSISSIPPI-MISSOURI...... Professor J. P. Lamberton.
MISSOURI...... J. M. Greenwood.
MITHRAS...... James Macdonald, LL.D.
MOHAMMED...... Emm. Deutsch and Rev. John Milne.
MOLE; OWL...... W. Ramsay Smith.
MOLIERE...... Professor Saintsbury.
MOLUCCAS...... Professor A. H. Kane.
MONEY...... Professor J. S. Nicholson.
MONTAGUE; MORE...... P. Hume Brown, LL.D.
MONTESQUIEU...... Professor Hastie.
MONTRAL; OTTAWA...... Martin J. Grabin.
MONTROSE, MARQUIS OF...... F. Hunter Groatse.
MOON; METEORS...... Rev. E. B. King.
MOOR; NAVARRE...... Rev. Wentworth Webster.
MOORE; JOHN...... Sir Edward Grey, Bart., M.P.
MORMONS...... F. D. Richards, Historiographer.
MOROCCO...... Dr. Robert Brown.
MOTION...... Professor G. G. Knott.
MOTLEY...... Rev. F. H. Underwood, LL.D.
MOUNTAINS...... Professor James Gekie.
MUSIC; MOZART...... Franklin Peterson.
MYTHOLOGY...... P. B. Jevons.

The Publishers beg to tender their thanks, for revising or correcting articles in this Volume, to the EARL OF SOUTHERN; the Very Rev. the DEAN OF NORWICH; the President of MAYNOOTH; Professor MAXMULLER; the Head-master of MARLBOROUGH COLLEGE; the Registrar of OWENS COLLEGE; the town-clerks of Northampton, Nottingham, &c.; Mrs OLIPHANT and Miss Nightingale; and Mr John Murray, publisher; and Mr Gardner, Paisley.
Maltebrun, Konrad (properly Maltie Conrad Bruun), geographer, born 12th August 1775, at Thisted, in Jutland, studied in Copenhagen, but was banished in 1800 because of his having openly shown his sympathy with the French Revolution. He sought refuge in Paris, where he supported himself by teaching and literary labours. With Meunel and Herbin he compiled a Geographie Mathematique du Monde (16 vols. 1803-7); and in 1808 he began Annales des Voyages, de la Geographie, et de l'Histoire (24 vols.), in 1818 Nouvelles Annales. His principal work is a Precis de la Geographie Universelle (8 vols. 1810-29; latest ed. 6 vols. 1872). He also contributed to the Dictionnaire de la Geographie Universelle (8 vols 1821), and took an active part in founding the Geographical Society of Paris. He died 14th December 1826.—His son, Victor Adolphe Maltebrun (1816-89), was professor of History and Geography at the college of Paniers and subsequently at Paris (1848-60); and from 1860 onwards he was secretary of the Geographical Society of Paris. He was the author of numerous geographical works, as La France Illustrée (new ed. 1879-84), L'Allemagne Illustrée (1884), Histoire Geographique et Historique de l'Allemagne (1868-69), &c.

Maltese Dog, a small kind of spaniel, with roundish muzzle, and long, silky, generally white hair. It is fit only for a lapdog.

Malthus, Thomas Robert, the exponent of the theory of population, was born 17th February 1766, at the Rockery, near Dorking, in Surrey, where his father owned a small estate. He was ninth wrangler at Cambridge in 1788, was elected Fellow of his college (Jesus), took orders, and was appointed to a parish in his native county. In 1798 he brought out his Essay on the Principle of Population, which attracted great attention and met with no little criticism. During the following years Malthus extended his knowledge of the subject both by travel and by reading, and in 1803 published a greatly enlarged edition of his essay. In 1804 he married happily, and next year was appointed professor of Political Economy and Modern History in the East India Company's college at Haileybury, a post which he occupied till his death at Bath on 24 December 1834.

Personally Malthus was a kindly and accomplished man, who followed what he believed to be the truth, and who endured without a complaint the abuse and misunderstanding to which his writings exposed him. The aim of the Essay was to supply a reasoned corrective to the theories regarding the perfectibility of society, which had been diffused by Rousseau and his school, and which had been advocated in England by Godwin. Malthus maintained that such optimistic hopes are rendered baseless by the natural tendency of population to increase faster than the means of subsistence. He pointed out that both in the animal and vegetable kingdoms life was so prolific that if allowed free room to multiply it would fill millions of worlds in the course of a few thousand years. The only limit to its increase is the want of room and food. With regard to man, the question is complicated by the fact that the instinct of propagation is controlled by reason; but even in his case the ultimate check to population is the want of food, only it seldom operates directly, but takes a variety of forms in accordance with the complexity of human society. The more immediate checks are either preventive or positive. The former appear as moral restraint or vice. The positive checks are exceedingly various, including 'all unwholesome occupations, severe labour and exposure to the seasons, extreme poverty, bad nursing of children, large towns, excesses of all kinds, the whole train of common diseases and epidemics, war, plague, and famine.' Malthus goes on to show the application of his principle by
a review of the history of the different nations and races, showing what are the actual checks that have limited population—plagues, victories— and proving that the population difficulty has affected the development of society from the beginning.

It cannot be said that Malthus was original in his exposition of the theory of population. It is a theme that has been discussed since antiquity. Yet shortly before the time of Malthus the problem had been handled by Benjamin Franklin, Hume, and many other writers. Malthus crystallised the views of those writers, and presented them in systematic form with elaborate proofs derived from history. In certain details and in the form of exposition the Essay may be criticised; but the broad principles of it can be doubted only by those who do not understand the question. The enormous increase of the means of subsistence attained by colonisation and modern industrial development has only for a time postponed the population difficulty for the world as large, while its pressure is still felt in the more thinly peopled centres both of Europe and of the East. At the present time the most interesting feature of Malthusianism is its increasing and accelerating effect on the world. It is seen how natural selection was the inevitable result of the rapid increase of all organic beings; such rapid increase necessarily leads to the struggle for existence. To prevent misunderstanding it should be stated that Malthus gives no sanction to the theories and practices currently known as Malthusianism. In this reference Malthus approved only of the principle of moral self-restraint: 'do not marry till you have a fair prospect of supporting a family.' Besides his Essay, the Principle of Population Malthus wrote two important works, An Inquiry into the Nature and Progress of Rent and Principles of Political Economy. See Memoir by Dr Otter, Bishop of Chichester (prefixed to 2d ed., 1836, of the Principles of Political Economy); also Bonar's Life of Thomas Robert Malthus.

Malton, a town in the North and East Ridings of Yorkshire, on the Derwent, 22 miles N.E. of York. It consists of New Malton, Norton, and Old Malton. The Derwent probably of the Romans; it has the Norman church of a Gilbertine priory (1150), and a free grammar-school, founded in 1563. Besides his Essay, the Principle of Population Malthus wrote two important works, An Inquiry into the Nature and Progress of Rent and Principles of Political Economy. See Memoir by Dr Otter, Bishop of Chichester (prefixed to 2d ed., 1836, of the Principles of Political Economy); also Bonar's Life of Thomas Robert Malthus.

Malvern, a natural order of exogenous plants, of which about 1000 species are known, chiefly tropical and most abundant in America, although the most important species belong to the Old World. They are herbaceous plants, shrubs, and especially in tropical countries trees; with alternate entire or lobed leaves; the flowers showy, generally on axillary stalks. The plants of the order have a great general similarity both in appearance and in properties and products. All contain a mucilaginous substance in great quantity, and some are very useful as an emollient and demulcent in diseases of the throat. The seeds contain a considerable quantity of bland fixed oil. The inner bark of the stem often yields a useful fibre, for which species of Hibiscus and Sisal are particularly valued; and to this order belong the cotton plants. The cotton plants—HuNCHER, HOLLYHOCK, MALLOW, MARSH-MALLOW, &c.

Malvern, GREAT, one of the most fashionable watering places in England, is situated 9 miles N.W. of Worcester, and 129 W.N.W. of London, on the east side of the Malvern Hills, as the foot of the Worcestershire Beacon, from the summit of which (1444 feet above the sea-level) extensive views are obtained. It is irregularly laid out, and has a fine cruciform church, with a square embattled tower 124 feet high rising from the centre, rebuilt in the reign of Henry VII., and restored in 1869-71. In the centre of the town are large Assembly Rooms (1844) built in Greek Colonnades, and on the outskirts is Malvern College, a handsome building in the Gothic style of the early Decorated period, erected in 1863-65: the present number of boys is nearly 250, and there are several entrance scholarships, tenable during residence, of from £70 to £30 a year, and a leaving scholarship of £20 for three years, tenable at Oxford or Cambridge. Madame Goldschmidt (Jenny Lind) resided near Malvern for many years previous to her death. Pop. (1801) 819; (1831) 5846; (1861) 6107. See Blackwood's Magazine for August 1834.

Malwa, a former kingdom of India. See CENTRAL INDIA.

Mamelukes, properly MAMLUKS, an Arabic word signifying white slaves captured in war or purchased, who were brought to Damascus by the slave-kings in Egypt. These had their origin in the importation of a large number of Turkish slaves, from the regions of the Caucuses and Asia Minor, by Es-Salih Ayyub, grand-nephew of Saladin, and sultan of Egypt, in the middle of the 13th century. They were intended to act as a bodyguard and to defend their master against his numerous rivals as well as against the Crusaders, and they fulfilled their duty well, as is shown by the success of their repulse of the French invasion and the capture of St. Louis in 1244. In the absence of capable successors to Es-Salih, his Mamelukes set up one of their own number as sultan of Egypt in 1250, and from that year to the Ottoman conquest in 1517 that country and Syria were ruled exclusively by Mameluke sultans. They were forty-eight in number, often retaining the throne but a few years, or even months, in consequence of the intrigues of rival emirs; and they fell into two dynasties, the Bahri or Turkish Mamelukes (1250-1390) and the Burji or Circassian (1390-1517). In spite of the infighting shown out of the military oligarchy, and owed his throne to personal prowess and the support of the biggest battalions, rarely to hereditary title. The Mamelukes did not readily propagate the race in a foreign country, and fresh importations were necessary to keep up the stock. As a rule they were of their own rank, the dey becomin king, and kept his place just so long as he retained his following. Violent deaths were common; the sultan's bodyguard was the most essential part of the constitution, and held a large portion of the land of Egypt on a species of feudal tenure. Each of the great lords was a Mameluke sultan in miniature, kept a bodyguard, lived in much state, and was generally prepared to fight his way to the throne should occasion favour the attempt. The streets of Cairo were frequently the scenes of sanguinary outbursts, and its citadel is full of the memories of treacherous assassins and bloody revolts. There was a very small number of Mamelukes; they were strong, and, although their numbers had increased, they were still a minority of the population.
the smallest details of house furniture and decoration. The museums of Europe and Cairo are full of their debris. Tours are guarded. The great, wood carvings, ivory reliefs, enamelled glass, tiles, stone and plaster work, mosaic pavements, and silk embroideries. Their court ceremonies were gorgeous with the pomp of heraldry and armour and dazzling robes; their luxury at home was stunnfing. Turks as a rule, they had tastes beyond the ken of the Ottoman Turks who possessed them in 1517, and Egypt has not yet recovered from their loss. After the Turkish conquest the government was placed in the hands of an Ottoman pasha assisted by a council; whilst the younger princes have always been held in custody and employed to administer the provinces. The bey retained most of the power, however, and the pasha became a cipher. Their last brilliant achievements were on the occasion of Napoleon's invasion of Egypt in 1798, when they fought the disastrous battle of the Pyramids near Cairo; but after the retirement of the French and British armies Egypt became a prey to disorder, rival Mamelukes fought and intrigued, and order was not restored until Mohammed Ali established his authority as pasha under the Porte, and seized power in 1798. In 1801 and 1811, exterminated the Mameluke princes, save a small remnant who took refuge in the Sudan, where their medieval armour was recently seen by the British forces employed against the Mahdi.

See Weie, Geschichte der Khalefen; Quatremere, Malrazi's Histoire des Sultans Mamlous; S. Lane-Poole, Archeologie Seldjoukide en Perse; Sir W. M'Intire, The Mame- luke or Slave Dynasty (1860).

Mammars, a town in the French dep. of Sarthe, on the Dive, 43 miles NNE. of Le Mans, Pop. 6288.

Mamiani della Rovere, Count Terenzio, born in 1590 at Pesaro, took a prominent part in the affairs of Europe under the pontificate of Gregory XV., and was compelled to flee to Paris, whence he returned to Rome in 1848 after the unconditional amnesty of Pius IX., and actually held office for three months in the papal ministry. He next withdrew to Turin, where he founded, with Giberti, the famous Società per promuovere l'unità. On the flight of Pius IX. from Rome to Gaeta he re-entered the political arena, and was for a short period foreign minister in the revolutionary cabinet of Galetti. On the fall of Rome he retired to Genoa, and returned again as a member of the Sardinian parliament, and in 1860 entered Cavour's ministry as minister of Instruction. He was appointed ambassador to Greece in 1861, to Switzerland in 1865, and died at Rome, 21st May 1885.

Among his writings are Del Rinvenimento della Moneta antica Italiana (1836), Poeti dell'Età media (1842), Del Papato (1851), Confessioni d'un Mezzofioso (1865), Torre della Religione e dello Stato (1868), La Religione dell' Avezd (1879), b.sides books on special social and philosophical problems, and treatises on various subjects. See his Life by Gaspari (1887).

Mammals (Mammalia, Lat. mamma, 'a breast') form what is usually considered the highest class of backboned animals, including numerous orders, of which the bear, elephant, and white, dog, beaver, and bat, anthropoidea, megatheria, and marsupials, are the most noteworthy prominent illustrative types. Compared with birds, mammals are most notably characterised by the greater development of their brains, and by the close connection between mother and offspring. In consequence there are grades of gestation; while in the higher orders there are many steps in the perfection of brains and wits, and in the evolution of the organic connection between the unborn young and the mother. The habits are also very varied, for though the great majority are terrestrial—browsers, runners, and climbers, a thoroughly aquatic habit is exhibited by the cetaceans, the sea-cows, the seals and walruses, and many genera here and there, while the bats have the power of true flight, and many swimming. And as the flying opossums, squirrels, and lemmes are more or less aerial (see FLYING ANIMALS). Similarly as regards food there is great variety, for fish and insects, fish and herbs, roots and flesh, are all utilised, and the diversity of diet is associated with marked difference, see (q.v.) in the plant. Some species have been recorded, varying in size from the smallest harvest-mouse, which is scarcely the weight of a halfpenny, to the giant whales, which approach 100 feet in length.

General Characteristics.—It will be useful to refer to the article BROW, where the three highest classes of vertebrates are contrasted; but a more detailed summary is now necessary. Female mammals always nourish their young for some time after birth with the milk produced by the mammary glands, whence the class is named. Their young are born viviparously; and in all mammals above Marsupials the embryo in the womb is organically connected with the mother by means of a Placenta (q.v.). The skin always bears at least some hairs, and these usually cover the whole body. The ears are generally smaller than in the lower class, and are called furred quadrupeds. In body-temperature, which is some index to the pitch of the life, mammals, though inferior to birds, are eminently warm-blooded; and in this connection we may notice that a complete muscular partition (marif rib wall) between the thoracic and abdominal cavities is never known. The lungs lie freely and are invested by (pleural) sacs; the heart is four-chambered and gives off a single aortic arch to the left side (to the right in birds); the red blood-corpuscles are non- nucleated when fully formed. The parts of the alimentary tract show a greater curvature than in lower forms, while the cerebral hemispheres predominate, become more and more convoluted, and are united by an important bridge called the corpus callosum. Except in Monotremes, the rectal and the urino- genital apertures are separate, but in the exception, the ova are small and poor in yolk, and undergo total segmentation. The skeletal characteristics are necessarily more technical, but it is important to notice that the skull moves not on one condyle as in birds and reptiles, but on two as in amphibia; the lower jaw is a single bone on each side, and articulates not with the quadrate as in Sauropsida but with the squamosal; a chain of three ear-ossicles (malleus, incus, and stapes, probably equivalent to the articular, quadrate, and columella or luo-mandibular of lower forms) connects the drum with the internal ear; the teeth, rarely quite absent, are set in distinct sockets; the vertebrae of the neck are (with three exceptions) seven in number; the coracoid bone (except in Monotremes) is a mere process of the scapula; and so on. As the various systems are dealt with in special articles (see BRAIN, CIRCULATION, HAIR, SKULL &c.), it seems unnecessary to expand the above summary.

The Sub-classes of Mammals.—In 1816 De Blainville divided mammals into three sub-classes, the Monotremata, which has since been firmly established. The two orders of Monotremata (duckmeke and Echidna) and of Marsupials (kangaroo, opossum, &c.) he raised to the rank of sub-classes under the titles Ornithodelphia (lit. 'bird-wombed') and Didelphia (lit. 'double-wombed'), in contrast to all the other mammals, which he termed Monodelphia.
For these three sub-classes, which are distinct enough to be regarded as separate branches of the primitive mammalian stock, Huxley proposed the less objectionable titles Protatheria, Metatheria, and Eutheria, which are now generally adopted.

The most important contrasts between them may be summarised in the following tabular scheme, which ought to be expanded and verified by reference to the articles Ornithorhynchus, Echidna, Kangaroo, Marsupials, &c.

Orders of Mammals.—Leaving the Monotremes (1)—duckbilled and Echidna—and Marsupials (2)—kangaroo, opossum, &c.—by themselves in marked contrast to one another and to the placental series, we begin the latter with two orders in many ways more primitive than the rest—viz. the Edentata (3)—shfts, anteaters, armadillos, &c.—and the Sirenia (4)—dugong and manatee. It seems possible to group the other

which some would erect a special order. Another line is especially characterised by the great order Ungulata (8), including (a) Odd-toed or Perissodactyl style forms—horse, rhinoceros, inquir, &c.—(b) Proboscideans—like elephants, (c) the unique genus Hyrax, and (d) the even-toed or Suiforms—sheep and cattle, chevrotains, camels, hippopotamuses, and pigs. But with the Ungulates there are many reasons for connecting two other orders, the Cetacea (9)—whales and dolphins—and the Rodentia (10)—rats, hares, squirrels, &c. Finally, along a third branch, which probably had its origin in a stock common to the Ungulates on the one hand, to the Carnivores and Insectivores on the other, we have to place the Lemuroidea (11)—lemurs—and the Primates (12), the latter including the marsupials, the New-World monkeys, the Old-World monkeys, and man himself.

Extinct Mammals.—(a) The oldest mammalian remains date from the Upper Trias—i.e. from near the beginning of the Mesozoic or Secondary System. Thus, fragments of a small animal known as Dromatherium suggest a primitive type, possibly ancestral to the Monotremes. (b) In Jurassic strata remains of small mammals are locally abundant, and represent more than one type of Marsupial. (c) From the next or Cretaceous period, the seeds of which are mostly of marine origin, other small types have recently rewarded the unwearied researches of Professor Marsh. (d) In the beginning of the Tertiary period, however, most of the modern orders of mamil have put in an appearance, and, as one would expect, there are remains of many types which form the common base of branches now widely divergent. Thus, the Crodont (c.g. Hymenodon
and Proviverra) are primitive Carnivora, which show skeletal affinities with Marsupials and Insectivores. Not less remarkably generalised are the Condylosauria (e.g., Phenacodus and Periphytus), primitive Ungululates showing affinities with Artiodactyles and Perissodactyles, with Hyracoidea and (through the Creodonts) with Carnivores, and (according to Cope) even with the Lemurs. In the same way the paleontologists find transitions

Fig. 1.—Slab of Rock showing the left lateral aspect of the skeleton of Phenacodus primus; from the Lower Eocene of North America: actual size of slab, 49 inches in length. (After Cope.)

between Insectivorous, Lemnroid, and Creodont types, between Perissodactyles and Probosicida (Dinocerata and Coryphodon), between Rodents and Ungulates (Mesotheria and Toxodon). So, too, a common base has been found for dogs and bears, for pigs and sheep, for deer and chevrotains; but it is enough for our purpose to emphasise the fact, which rapidly progressive research continually corroborates, that in early Tertiary times there persisted numerous generalised mammals which united many of the characteristics of our extant orders.

Distribution in Space.—Referring to the article on GEOGRAPHICAL DISTRIBUTION for the general results reached by the labours of Murray, Wallace, Seeliger, and others, we shall content ourselves with a few illustrations showing the importance of the inquiry in regard to mammals. Perhaps the most striking of these concerns the great insular region of Australasia, where, with the exception of some bats and marine mammals which transcend the usual limits of insularity, the fauna, and of forms introduced by man, the whole mammalian fauna consists of Marsupials and Monotremes. As all extant Marsupials, with the exception of the American opossums, are now Australian, and as fossil remains of the sub-class are found as far away as Europe, we have here one of the most remarkable cases of gradual restriction and of the saving results of geological changes. For, whatever the precise details may be, there seems no doubt that geological insulation saved the Marsupial immigrants to Australia from the jaws of their pursuers.

In the Lemurian group, again, we find one of the most singular phenomena in geographical distribution. For out of a total of fifty species thirty are confined to the one island of Madagascar, the remainder occurring through tropical Africa and in restricted portions of India and the Malay Islands—facts from which it is fairly concluded that in the insulated Madagascar the lowly organised Lemnroids diverged into specialised forms of their own peculiar type, while on the continents they have to a great extent become exterminated, or have maintained their existence in a few cases in islands or in mountain-ranges. The Edentata (sloths and ant-eaters) have also a very restricted distribution in modern times, for, with the exception of the seal ant-eaters or Manidæ (Ethiopian and oriental in range) and the African aardvark, the home of the order is in South America, where, moreover, in Pliocene times there flourished a giant race 'rivalling in bulk the rhinoceros and hippopotamus.

The Marsupials and most of the terrestrial mammals are absent from Oceania islands, so the aquatic Cetaceans have a world-wide distribution, and the Sirensians almost as wide as required conditions of temperature will admit. But it must be clearly noted that when we follow in detail the distribution even of those whose great powers of flight free them from the limitations imposed on terrestrial mammals, we find that the inhabitants of special regions are usually marked off with perfect definiteness. The same local definiteness holds true of the world-wide (Australia always excepted) distribution of Ungulates, Rodents, and Carnivores, and is signalised illustrated, for instance, in the complete absence of Insectivora from South America alone, or in the striking differences between Old and New World monkeys.

Of the ova, which are small and poor in yolk except in Monotremes, burst from the ovaries into the upper ends of the oviducts, may be fertilised by ascending spermatooza, and with the above exception develop in the lower portion of the female duct known as the utero, in the ovipens where they proceed the several stages of development, just like that of birds and reptiles; in all the others the egg segments completely. The development proceeds in a fashion somewhat different in detail from that of the other vertebrates, but it is more important to notice that in the Placental a close vascular connection is speedily established between the embryo and the wall of the utero. In the hedgehog, which is a remarkably central type, this connection is first of all maintained simply by the outermost layer of the developing egg; but this is later abetted by a union between the yolk-sac and the maternal wall, which in turn gives place to the true placenta, mainly due to the Allied (q.v.). The final result is an interlocking of the maternal tissue with that of the foetal membranes, and the whole life of the embryo depends on the union, which is only interfered with by the amnion, which blood of the mother is vitally though not directly united with that of the offspring. At birth the union is severed, and the embryonic part of the placenta, with more or less of the associated lining of the uterus, is discharged. The remaining parts of the placenta vary considerably in different orders, and have furnished important aid in determining relationship. Of mammals as of other animals it is true that the individual development recapitulates, in general outline, the history of the race, for the life begins at the beginning again in a single cell, divides into a ball of cells, acquires a layered body, and passes from stage to stage presenting successively the general features of a vertebrate, of a reptilia (†), of a simple mammal, of an insectivore, and finally in a young hedgehog, Nursing, the most signal phenomena in geographical distribution. The eggs of the duck-kine are laid in a nest, those of the Echidna just as if it were reclining in a corner, and the yolk is secreted by the oviparous Monotremes, which are destitute of teats, but the embryos have a considerable store of yolk which serves as preliminary capital. The eggs of the duck-kine are laid in a nest, those of the Echidna just as if it were reclining in a corner, and the yolk is secreted by the oviparous Monotremes, which are destitute of teats, but the embryos have a considerable store of yolk which serves as preliminary capital. to suck the mammae actively, and their hitherto unused food-canals, gently tutored by the readily-digested milk, more or less rapidly acquire what Solas has happily termed a 'gastric education,' which remains an essential asset possible.

Origin of Mammals—Though the duckmole and the echidna lay eggs, and from the nature of their genital ducts have been termed Ornithodaphaelia, their affinities are rather with reptiles than with birds. For mammals and birds represent divergent lines, and secondarily the common descent of which is exceedingly remote. Recognising this, the theories as to the origin of mammals are mainly concerned with the probabilities in favour of a reptilian or an amphibian ancestry. In support of the latter it has been urged that mammals and reptiles have one; that the quadrate is small in the amphibia and mammals large in Saracopida; that some other parts of the mammalian skeleton (such as the pelvis) suggest affinities with amphibians; and even that the amphibians in their varied reproductive experiments are as likely as reptiles to have originated the characteristic mammalian parturition. On the other hand, the a priori probabilities are in favour of the reptilian orvertebrates are in general differentiation more evolved. Among the numerous extinct Saracids the Theriomorpha distinctly approach mammalia in some of their skeletal characters, the large partially-segmented ovum of the Monotremes seems much like that of reptiles than that of amphibia (which exhibits total segmentation), while it is not without interest that two lizards show an incipient form of yolk-sac placenta. A compromise between the rival theories has been proposed by St. George Mivart, who conceives the evolution of the Monotremes from Amphibians or allied reptilian types, the Marsupials from a distinct and earlier source, perhaps amphibian. Another compromise, equally problematical, would derive mammals from a primitive stock of fingered quadrupeds, the common ancestors of amphibia and reptiles. On the whole, however, the balance of probabilities seems in favour of the origin of mammals from extinct Saracids, such as those which Cope has grouped as Theriomorpha. A few zoologists, who are monophyletists, and regard Cetaceans as an original type, would derive them from the Ichthyopterygian reptiles; but this view has been received with virtually fatal criticism.

Evolution of Mammals—Deeper than the problem of determining whether mammals had their origin from amphibia or reptiles is that which inquires into the factors which actually contributed to their rise. This must have been very gradual both the fossil forms and the grades which still Saracids or reptiles, and it is important to realise what is indeed a general truth in regard to evolution, that many of the characteristic features of mammals are not so much new acquisitions as reconstructions and elaborations of what is old. The all-important mammary glands seem to be but modifications of the sebaceous glands diffused over the skin; the placenta is chiefly composed of the allantois, which all young reptiles and birds possess; the corpus callosum, which forms a bridge between the cerebral hemispheres, is already represented; etc., etc.; and the simplest evidence of the very gradual evolution of special types and structures—witness the long series which connects the Eocene Eohippus, a five-fingered, three-toed mammal, about the size of a fox, with the horse (p. 266) - see also Foot; or the evolution of brains from the small caps found inside the skulls of some of the early giants to such types as are exhibited by Monotremeand Marsupiain, and from these upwards to the climax in man; or the gradual growth of the organ of Corti (p. 72), from Miocene times onwards, a history rapidly recapitulated in the life of modern stages, but after realising the gradual development of structures, and appreciating the influence of natural selection in determining distribution, in eliminating giants, in fostering swiftness and strength, and in justifying big brains, many naturalists still find the problem of the evolution of mammals completely solved. It seems necessary to follow the school of Lamarck in recognising the inherent effects of use and effort, and the influence of a changeable environment in the progressive growth of the organism in definite directions. Furthermore, an account of the evolution of mammals has to take account of one of the most prominent characteristics, the maternal sacrifice expressed in the placental union, in the prolonged gestation (emphasised many years ago by Robert Chambers), and in the lacteal nutrition after birth, a sacrifice which must have been one of the most important factors in the progress of mammals. After a while the mammalian maternity (perhaps pathological at first and always excessive) must have paid or justified itself; but its recognition as a subordinate condition and preserver of species, maintaining, of nutritive struggle to reproductive sacrifice, is a necessary corrective to the prevalent theory which tends to emphasise too exclusively the competitive struggle for individual existence.

Intelligence and General Life.—Through the mammalian series, from the 'frog-witted' duckmole to the highest of the Primates, there is a gradual increase in complexity of brains and quickness of wits. The remarkably docile intelligence of the dog, the cleverness of the highly-evolved elephant, the ingenuity of the social beavers, and the 'humanness' of the higher apes are crowning illustrations which become all the more remarkable when we recall the minute brains of early mammals. A contrast between these types which excel and those which lag behind will also illustrate Spencer's
MAMMARY GLAND

MAMMOTH CAVE

Mammoth.

Mammoth, the name (originally Tartar, through the Russian) for an extinct elephant (Elephas primigenius), whose remains are sufficiently common in the recent deposits of northern Europe and Asia to afford a valuable supply of fossil ivory. In geological time, it is only as it were yesterday that the mammoth ceased to live, for its remains are often found along with those of man, and it seems to have persisted until after the Glacial Period. The cave-dwellers made use of its tusks, and on these too the prehistoric artists—the literal old masters—cut with no tyro hand the outlines of reindeer and various animals, including the mammoth itself. But the comparatively recent decease of this mammarian elephant has been repeatedly evidenced in a startling way by the discovery in Siberia of almost intact specimens, standing upright in the ice and frozen soil, with hair and skin, muscles and viscera, as well as bones, all well preserved. If fairly interpreted, the mammoth recorded was disinterred from the ice near the mouth of the Lena in 1806; the fisherman who discovered it had overcome his awe to the extent of cutting off the tusks, wild animals had gnawed the muscles, but the hair was still on the unjured parts of the skin, the brain in the skull, and the eyes still stared from their sockets. Others have since been disinterred, or washed out in great thaws, notably one in 1840 which was so marvelously preserved that the stomach still showed young shoots of fir and pine, and a quantity of chewed cones. Great numbers that we know nothing of must have been similarly thawed out, and their frozen corpses swept seaward to swell the accumulations of their remains found in the Arctic seas. Their disinterment after thaws explains the old Siberian opinion that the mammoths were monster burrowers, which died when they came to the surface, while the upright position in which the intact forms have been found suggests that they had been smothered where they were buried by sinking heavily into the tundra marsh. Though mammoths in complete preservation are rare, their tusks, teeth, and other bones have been found in great abundances from almost every county in England to Behring Strait, and thence into North America.

‘The whole appearance of the animal,’ one of the discoverers writes, ‘was fearfully wild and strange. Our elephant is an awkward animal, by compared with this mammoth it is as an Arabian steed to a coarse ugly dray-horse.’ It stood 13 feet high, 15 feet in length, with tusks 8 feet long; but some other specimens seem to have been larger. The dark skin was covered with yellowish to reddish soft wool about an inch long, with interpersed brownish hairs of 4 inches, and much sparser and longer black bristles. ‘The giant was thus well protected against the cold.’ The mammoth was liken the Indian than the African survivor, but it is only one of a crowd of fossil Proboscidea distributed in Tertiary deposits over all the great continents. Mammoth, Mastodon, and Dinothoe are the three most prominent types. Most of them were giant animals, but there seem also to have been pigmies no larger than sheep. Once numerous and widespread, the elephants are now represented only by the two modern species of restricted distribution. To this result many factors, such as the voracity of Carnivores, the deforesting of countries, the changes of climate, and the expensiveness of great bulk, have contributed. The ivory exported in large quantities from Siberia is in great part collected from the islands, some of which are almost literally heaps of mammoth bones.

See ELEPHANT; also, for facts, not differences, H. H. Howorth’s Mammoth and the Flood (1887); Norden skjold’s Voyage of the Vega; Boyd Dawkins, in Quart. Journ. Geol. Soc. XXXV. (1879).

Mammoth Cave, in Kentucky, is 85 miles by rail SSW. of Louisville. The cave is about 10 miles long; but it is said to require upwards of 150 miles of travelling to explore its multitudinous conclusion that the rate of reproduction varies inversely with the degree of individualization, for in the more highly-developed forms the number of offspring tends to diminish, while the parental care is more elaborately provided. The adaptations to diverse habits and diets, the varying length of life and the means of avoiding death, the migrations of some and the liberations of others, the struggle for mates as well as for food, the evolution of family-life and even of social sympathies are subjects of inquiry which will repay observation and further study of mammals.

Mammary Glands. See BREASTS.

Mammea Apple (Mammea americana), a highly-esteemed fruit of the West Indies (where it is sometimes called the Wild Apricot) and tropical America. It is probably by a beautiful tree of the natural order Guttaeae, 60 to 70 feet high. The fruit is roundish, from the size of a hen’s egg to that of a small melon, with a thick, leathery rind, and a very delicate inner rind adhering closely to the pulp, which must be carefully removed on account of its sugar. The fruit is firm and bright yellow, with a peculiar sweet and very agreeable taste, and a pleasant aromatic odour. A similar fruit is produced by Mammea africana, an African species.
avens, chambers, groteses, rivers, and cataracts. The main cave is only 4 miles long, but it is from 40 to 300 feet wide, and rises in height to 125 feet; its depths are 300 feet high, the loftiest of the many vertical shafts that pierce through all the levels. Some avenues are covered with a continuous incrustation of the most beautiful crystals; stalactites and stalagmites abound. There are streams and falls, the waters of which run outside the cave, rising with the river, but submerging more slowly, so that they are generally impassable for more than six months in the year. The largest is Echo River, three fourths of a mile long, and in some places 200 feet wide. The air of the cave is pure; the temperature (15 °F.) is uniform.

There is an elaborate work on The Mammoth Cave of Kentucky by H. H. Hewes and B. E. Call (1867); for the fauna, see works cited at CAVF: A. S. Packard, The Inhabitants of the Mammoth Cave (1862); and a memoir on The Cave Fauna of North America (1888).

**Man.** As the races of mankind, the structure and functions of the human body, and the higher activities most distinctive of man are discussed in special articles, it is enough here to restrict attention to three problems: (1) the human characteristics; (2) the origin or descent of man; and (3) the antiquity of man.

1. **Characteristics.**—Considered like any other organism, man is strictly the highest of the Primates, differing from the anthropoid apes only in degree. In adult life he is unique in his erect posture, and in the freedom of his limbs and trunk. The skull and the brain of the European or American man are relatively smaller; the nose-Iines project more beyond the upper jaw; and the chin is more prominent than in other Primates. A much more momentous characteristic, however, is involved in the fact that the brain of an adult man is more than twice as heavy as that of any other existing animal. This fundamental step towards the structural advance is an index to that intellectual and emotional development which raises even the savage degrees much above the brute, and which in its highest realisation is still full of promise. Therefore, while all naturalists allow, with Professor Owen, that there is 'an all-pervading similitude of structure' between the human body and that of the anthropoid apes, there is equal agreement that in intelligence, emotions, and control of his own life man is pre-eminent.

But, apart from these zoological considerations, it is interesting to notice some statistical results in regard to human (and especially British) characteristics derived from the Report (1860) of the Anthropometric Committee of the British Association. Thus, the average height of man is 5 ft. 3¼ in.; the Polynesians lead the list, with an average of 5 ft. 9¾ in., the English professional race following with 5 ft. 9⅛ in., and so on, down to the Bushmen, who average 4 ft. 7¾ in. As to weight, the Scotch stand first (68 lb. in weight), the English second (67 lb. in weight), the Welsh last (70 lb. in weight), the average being 67 lb. The Scotch are also first in weight (165 lb. in weight), the Scotch second (153 lb. in weight), the English third (151 lb.), and Irish men (148 lb.), the average being 150 lb. Again, a typical adult Englishman has a stature of 5 ft. 7¾ in., a chest girth of 36½ in., a weight of 10 stone 10 lb., and is able to draw, in drawing a bow, a weight of 7½ lb. As to the sexes (in England), the average man's stature and weight is 67¾ in. and 155 lb., as against 62½ in. and 122½ lb. for the women. Moreover, the men are about twice as strong. For further results, many of which are of profound practical suggestiveness, the Report should be consulted.

2. **Origin of Man.**—Even when we confine our attention to the opinions of those who accept the theory of evolution as a modal explanation of nature, we are in fairness bound to recognise some diversity of opinion in regard to the origin of man. (a) So unique does he appear to some that his descent from a humber organism seems incredible; a position in favour of which some arguments will be found in the cited works of A. de Quatrefages. (b) Alfred Russell Wallace and others reject the idea of 'special creation' for man, as being entirely unsupported by facts, as well as in the highest degree improbable; yet believe that his progress from the brute was due to introduction of new causes, or 'spiritual influxes,' to which the higher human characteristics owe their origin. (c) The majority of naturalists deem this hypothesis of some spiritual influx inconsistent with the continuity of evolution, and regard it as a 'natural' process, self-sufficient throughout, for the origin of man as for other grand results.

The arguments which go to show that man is descended from a simpler animal are, of course, the same and are based on a combination of facts and theory. Thus, his structure and functions are not demonstrably different in kind from those of the nearest Primates; he develops from a fertilised egg-cell, and passes through successively higher grades of organisation in a manner which seems entirely in accordance with the general lines of animal history; he varies as other animals do, is subject to similar diseases, and exhibits numerous reversions and rudimentary structures which are enigmas, except on the theory that he had his origin from an ape-like stock. How his evolution was brought about is a problem worthy of elucidation, but among the special factors which conduced to evolve his higher characteristics of wisdom and gentleness it seems almost certain, as Herbert Spencer has emphasised, that the progressive evolution of man must be restricted to intellectual and emotional qualities.

3. **Antiquity of the Race.**—From the human remains, and far more frequently from the weapons, tools, and other vestiges of human activity, found in the more recent deposits on the earth's surface, it is obviously legitimate, after due caution, to infer the presence of man at the time—certainly not estimable in the years of any chronological system—when the earth was formed. Cuvier and others tried, indeed, to avoid this conclusion—for instance, by exaggerating the power of floods in mixing up recent deposits; while Boucher de Perthes, who in 1856 discovered flint axes along with mammal bones in undisturbed strata 20-30 feet below the surface, had to wait almost two years for a fair hearing, and yet longer for decisive corroboration. Both were gained, however, and the conversion of naturalists may be dated from 1863, when Lyell summarised the existing evidence in his *Antiquity of Man*. Since then the problem has been worked at with ever-increasing energy.
and success, and there is now general agreement that man was alive during the later stages of the glacial epoch, while there are indications of his presence in Pliocene and, according to a few, even in Miocene ages (see GEOLOGY).

Older, however, than any indications of his Pleistocene presence, are the remains of men surely to be classified by many paleontologists as the progenitors of man, now known as Australopithecinae, and described by Lawrence (1884), who grouped the species into two genera, Australopithecus and Paranthropus, and divided them into three species. These were: Australopithecus, large brain, had a tailless and long-legged appearance, succeeded by Paranthropus, skull small, but hands and feet well-developed. The remains of man are scattered throughout Europe and Africa.

The climate is remarkable for the limited range of temperature, both annual and diurnal; western and south-western winds greatly predominate, easterly and north-easterly winds occurring chiefly in the autumn quarter. Myrtles, fuchsias, and other tender exotics flourish throughout the year.

The fisheries afford employment to nearly 4000 men and boys. More than 700 boats are employed in the herring and cod fisheries, the average annual produce is above £20,000. Large numbers of fat cattle are shipped to the English markets, as well as about 20,000 quarters of wheat annually. The manufactures are considerable. The revenue derived from the island amounts to about £50,000 per annum; of this the greater part is received from customs duties, and the whole; except £10,000 a year payable to the imperial treasury, is used for insular purposes.

The Isle of Man possesses much to interest the antiquary. Castle Rushen (see CASTLETOWN), probably the most perfect building of its date extant, was erected by the Normans in 1107. The ruins of Rushen Abbey (1154) are picturesquely situated at Ballasalla. Peel Castle, with the cathedral of St German, is a very beautiful ruin, dating from the 12th century (see castri). There are numerous so-called Druidical remains and Roman monuments throughout the island; the Rune crosses, of which there are some forty in all, are especially numerous at Kirk Michael. The Tynwald Hill at St John's, near the centre of the island, is a perfect relic of Scandinavian antiquity. The Acts of Tynwald are here proclaimed. The hill is artificial, circular, and arranged in four platforms. Both institution and use should be compared with the Icelandic Tingvalla. The island is divided into six shielings; these into seventeen parishes; these, again, were divided into trecens (now obsolete), and, lastly, into quarter-lands. The towns, noticed separately, are Castletown, Douglas, the modern capital, Peel, and Ramsey.

The principal line of communication with the United Kingdom is between Douglas and Liverpool, by means of a fleet of small steamers. There is a submarine telegraphic cable between Maughold Head and St Brees Head. In 1873 a line of railway was opened between Douglas and Peel; in 1874 to Castletown and the south; and in 1879 to Ramsey—all on the single narrow-gauge system. Extensive improvements in the way of harbours, works, piers, and promenades have been carried out at Douglas, Ramsey, and Peel. Pop. (1821) 40,081; (1841) 47,986; (1851) 54,042; (1881) 54,059; (1901) 55,598; the smallness of the increase being attributable to emigration. Visitors number about 130,000 annually.

The Roman Mona was not Man, but Anglesey. Previous to the 6th century the history of the Isle of Man is involved in obscurity; from that period it was ruled by a line of Welsh kings, until the end of the 9th century, when the Norwegian, Harald Hiarfanger, invaded and took possession of the island. A line of Scandinavian kings succeeded, until Magnus, king of Norway, ceded his right in the island and the Hebrides to Alexander III of Scotland in 1266, on the condition of being the direct result of the disastrous failure of the expedition of Haco of Norway against the Scots in 1263. On Alexander's death the Manx placed themselves under the protection of Edward I, and remained under English rule until the time of Elizabeth, when they received a charter of incorporation in 1575, and the settlement of the island by the descendants of the original inhabitants. The island has a population of 52,000, and a total area of 270 square miles. The climate is temperate, and the winter cold. The country is divided into fourteen districts, or parishes, and contains a number of villages, including the principal town of Ramsey. The island is rich in minerals, and is noted for its slate-quarries. The chief articles of commerce are manufactures, agriculture, and fisheries. The principal manufactures are of wool and flax, and the chief products are potatoes, wheat, and barley. The fisheries are prosecuted on a large scale, and are the chief source of revenue. The island is also celebrated for its scenery, and is noted for its beauty and seclusion. The Manx cat is tailless (see CAT).
MAN

Down to the middle of the 19th century the island was almost exempt from taxation and consequently looked upon as a cheap place of residence, while its laws were available for the protection of English debtors. All this has long ceased. Taxation, locally imposed, has been introduced for various purposes; and, though there is no poor law, rates in all are not unknown. The influx of visitors, and the facilities for exporting native produce, have equalised prices with those obtaining in the surrounding countries, and the social condition has been much modified.

See The Isle of Man, by the Rev. J. O. Cunning; History of the Isle of Man, by Joseph Brown; Brown's Popular trade; Chronicles Bemum Mannfer, edited by Mruch (Christiania, 1861); Surnames and Place Names of Man, by A. W. Moore, prefixed by Prof. Kyes (1861); Hall Caine, The Little Manx Nation (1891); and the publications of the Manx Society (19 vols. 1858-68).

Mannar', GULF OF, lies between Ceylon and the Madras coast, and is closed on the north by a low reef of rocks and islands called Adam's Bridge. Its extreme breadth is nearly 200 miles. The gulf is famous for its pearl fisheries.

Manacor', a town of Majorca, in a fertile plain, 30 miles E. of Palma by rail. Pop. 14,929.

Managua, the capital of Nicaragua, lies in a fertile district, on the south shore of Lake Managua, 53 miles by rail S.E. of Leon, and has perhaps 10,000 inhabitants. For the lake, see LEON.

Manakin, a name applied to various birds of the South American group of Chatterers (see CHATTER), amongst others to the Cock of the Rock. See also COTINGA.

Manaus, capital of the state of Amazonas, in the republic of Brazil, is on the Rio Negro, 12 miles above its confluence with the Amazon. An ugly, white-washed cathedral dominates the town, which also boasts a custom-house, a tiny fort, and a military hospital. It is a steamboat station, and has a considerable trade in various forest-products, but principally in India rubber. The population, though often stated at 25,000 to 30,000, is under 12,000.

Manassas, formerly MANASSAS JUNCTION, a village close to Bull Run (q.v.). The Confederates called their two victories here the first and second battles of Manassas.

Manasseh, the name of the eldest son of Joseph. The tribe of Manassath received land on the north side of Jordan; and on the death of Joseph, Manasseh was also the name of one of the kings of Judah (the fourteenth), who succeeded his father Hezekiah, 697 or 699 B.C., at the age of twelve, and reigned, according to the narrative, for fifty-five years. He rushed headlong into all manner of idolatry, and seduced the people to follow his example. Carried prisoner to Babylon, he repented, and his prayer was heard (2 Chron. xxxiii).

The apocryphal composition called the Prayer of Manasseh, found in some MSS. of the Septuagint, we never positively received as canonical.

Manasseh ben Israel, a Jewish scholar, was born at Lisbon in 1604, fled with his father from the Inquisition, and settling at Amsterdam became chief rabbi of the synagogue there. In 1656 he visited England, seeking to secure (see JEWs, Vol. VI, p. 328) from Cromwell the renunciation of the Jews. From 1656 to 1660 at Middelburg he published texts of various parts of the Old Testament, with notes; De Creatione Problematiri XX. (1635); De la Resurrection de los Muertos (1636); De Termino Vetere (1639); Espenauza de Israel (1630); Fine que s'amanent, a a Letter in answer to Questions propounded (Lond. 1650); and Humble Address to the Lord Protector on behalf of the Jewish Nation (1651).
Manatee

there are yellow bristles about the mouth; the eyes are small and deeply sunk, and the nostrils are valved slits at the end of the snout. From the dugongs they differ in having a thicker body and a straighter head, with the jaws but slightly curved, in the rounded or shovel-like shape of the tail, and in the presence of rudimentary nails on the fore-limbs, to the hand-like form of which the word Manatee refers. They differ also in more technical characters—e.g. in the very exceptional occurrence of six instead of seven neck vertebrae, and in the Dentition (q.v.), which in the adult manatee is represented by horny pads replacing the front teeth lost in early life, and by ½ ridged molars, of which, however, only 2 are in use at a time. The manatee, though becoming scarcer, is still harpooned or otherwise caught, being valued on account of its palatable flesh, its abundant fat, and its strong skin. Gentle and affectionate, it readily admits of being tamed, and living specimens have been successfully transported to the Zoo in London.

Manchurian, a district forming the eastern part of Chotta Nagpoor (q.v.).

Manby, GEORGE WILLIAM, inventor of life-saving apparatus for shipwrecked persons, was born in 1763, at Hilgay, near Downham Market in Norfolk, served in the militia, and became barrack-master at Yarmouth in 1803. In 1808 he succeeded, with apparatus designed by him, in saving the lives of the crew of the brig Elizabeth. A career of usefulness was thus commenced, which he followed for the remaining forty-six years of his life. He repeatedly received grants of money from parliament. He died November 18, 1854. It was estimated that, by the time of his death, nearly 1600 persons had been rescued from stranded ships by means of his apparatus. See LIFE-SAVING APPARATUS.

Mancha, LA, a district of Spain, the southernmost part of the old kingdom of New Castile, comprising most of the present province of Ciudad Real, with parts of Albacete, Toledo, and Cuenca (see CASTILE). It is the country of the ever-memorable Don Quixote, his squire Sancho Panza, and of the peerless Dulcinea del Toboso.

Manche ('sleeve'), a maritime department in the north-west of France, formed from the old province of Normandy, derives its name from La Manche (the English Channel), which washes its rocky coast, lined with lighthouses and breakwaters, for a breadth of 28 miles; area, 2589 sq. m. (1860) 520,865; (1891) 513,815. The climate is mild but humid. Cereals, flax, hemp, beetroot, and fruits are extensively cultivated. Immense quantities of apples are grown, and 20,000 and 80,000 gallons of cider are made annually. Horses of the true Norman breed are reared, and excellent cattle and sheep are fed on the extensive pastures. There are valuable granite quarries. The departement is divided into the six arrondissements of St. Lo, Coutances, Valognes, Cherbourg, Avranches, and Mortain. Capital, St. Lo. The port of Cherbourg and the rock of St Michel (with its celebrated abbey) belong to this department.

Manchester (Sax. Mancestor), a corporate and parliamentary borough of Lancashire, was elevated to the dignity of a city in 1847, by being made the see of a bishop, and confirmed by royal charter in 1853. It is situated in the hundred of Salford, on the east bank of the Irwell. Salford is on the opposite bank; and the two boroughs, connected by sixteen bridges (besides railway viaducts), may conveniently be considered as forming one city. Manchester is 387 miles NW. of London, 51 E. of Liverpool, 293 of Lancaster, 84 N. of Birmingham, 681 of York, 493 of Leeds, 414 of Sheffield, and 40 NE. of Chester. The growth of the population of the two boroughs is shown in the following table:

By the City Extension Act of 1885 the parliamentary boroughs were greatly extended, and later an agitation was begun in various suburban townships for incorporation. Five of these were already incorporated with Manchester in 1890, and others were expected to become incorporated. The city was made a county borough under the Act of 1888. The area of the parliamentary borough (comprising eleven townships and parts of two others) is 29 sq. m., and that of Salford 8 sq. m. Both boroughs were enfranchised by the Reform Bill of 1832, Manchester returning two members and Salford one member, since 1868.

The Reform Bill of 1867 gave Manchester three and Salford two members. Since 1885 Manchester returns six and Salford three members to parliament.

At present Manchester and Salford, and a large portion of the suburban population, are supplied with water collected on the slopes of Blackstone Edge, distant about 20 miles. The water works possess a total capacity of 3,282,000,000 gallons, and the average daily supply is about 25,000,000 gallons. The district of the population the city council purchased Thirlmere (q.v.), in Cumberland, giving a further supply of 50,000,000 gallons daily. The water is conveyed by aqueduct and tunnels (completed in 1894) to Bolton, and most of the remaining 60
The principal buildings for secular purposes are,
first, the town-hall (1868-77), by Waterhouse, com-
pleted in 1883. The original estimate for the build-
ing was £750,000; it has, however, cost £1,053,000,
and occupies an area of 8844 square yards. It is a
Gothic structure and triangular in form, built of
brick, faced with freestone, and at some parts with
granite; and it is claimed, the finest building in
the world devoted to purely municipal purposes.
The hall is decorated with remarkable frescoes illustrating
the history of Manchester, in Madox Brown's style. The clock-tower, 286 feet
high, contains a large peal of twenty-one bells.
In the Royal Infirmary, first used in 1755, as many as
32,000 patients are treated annually, and there is
an average of 25 accident cases admitted daily.
The Royal Institution is a noble Durie edifice by
Barry, built at a cost of £30,000, and contains
a gallery of paintings, a school of design, and a lecture
theatre. It was erected in 1825-30, its object
being to diffuse a taste for the fine arts by exhibiting
works of art of the highest
class, and by conducting
scientific and literary
pursuits by means of
popular courses of lectures.
The walls of the entrance-hall are decorated with casts of the
Elgin Marbles, presented by
George IV. A fine statue
of Dalton by Chantrey is placed in
the hall. The Royal Exchange
(1861-74), an imposing building in the Italian style, has a meet-
ing-hall adorned by Mr. Jackson, in the United Kingdom—area,
5170 square yards. It is 120 feet wide
without intermediate supports. Tuesdays and Fridays are the
effect days for business, and on these days the entrance area is
densely covered. The Free-trade
Hall (1856) holds 6000 people,
and is a memorial of the agitation which resulted in
the repeal of the corn laws. The Peterloo Massacre
occurred once on its site. The Assize
Court (1864), by Waterhouse, is a splendid
specimen of Gothic architecture, and cost £100,000.
The hall is a magnificent apartment, being
100 feet long, 48½ broad, and 75 feet high. All
the arrangements of the court are considered as
nearly perfect as possible.
The Literary and Philosophical Society (1789),
in George Street, has a valuable scientific library and
a chemical laboratory, and publishes memoirs.
On its roll are many distinguished names, including
Dr. Henry and Percival, Benjamin Franklin,
Thomas de Quincey, John Dalton, Eaton Hodgkin-
son, Sir W. Fairbairn, Sir James Whitworth,
James Nasmyth, and Dr. Joulle. There are about
seventy other societies and institutions of various kinds in Manchester, many of them of very high standing.
The statues and monuments in Manchester are
numerous, and vary considerably in order of merit.
On the Infirmary Esplanade are four statues—the
Duke of Wellington, Sir R. Peel, Watt, and
Dalton. The Market Memorial stands in Albert
Square, where are also statues of the Prince, of
Dr. Joulle (1891), and of John Bright (also in 1891).
In front of the town-hall is one of Oliver Heywood
(1864); there is one of Cobden in St Anne's Square,
Humphrey Chetham in the Cathedral, and of
Cromwell in the church of St Mary, near the entrance of Victoria Street.
The facilities for education in Manchester have
been greatly extended and improved within recent years.
The Grammar-school is the most ancient, and
was founded by Hugh Oldham, Bishop of Exeter, in 1515. Its original endowment was £290 per annum, but the possession of certain mills on the Irwell—a tributary of the Irwell—soon gave the school a substantial revenue. In 1825 the report of the Charity Commissioners showed that the total income of the Grammar-school Trust had reached a steady annual average of about £600. The original plan of the founder was altered, and the new scheme, as sanctioned by the Court of Chancery, is the admission of 100 boys at twelve guineas a year each, the remainder being on the foundation, and the school is enlarged to accommodate 250. Five new sites were purchased, and the then existing school buildings were disposed of to the corporation of Manchester. At Oxford, there are four scholarships belonging to this school, and eighteen others of which it has every third turn. In St John's College, Cambridge, it has, in turn with two other schools, a right to twenty-two scholarships. There is also a hospital school, founded in 1651 by Humphrey Chetham, 'for maintaining, educating, bringing up, and apprenticing forty healthy and poor boys.' By 1845 the revenue had increased sufficiently to justify the feoffors in increasing the number of fellowships. In 1855 Oxford College (q.v.). It is due to the liberality of John Owens, who died in 1846, leaving by will £100,000 to be expended in founding an educational institution of the highest class. In 1870 a further sum of £200,000 was expended on new buildings, &c. In 1883 was founded the University of Victoria University, of which Owens is one of the colleges, and by an additional charter the university was entitled to confer degrees in surgery and medicine. As an educational institution it has already earned a very high character, and has grown steadily in usefulness and resources. The university contains an excellent library and museum of natural history. The Technical School, with which in 1883 was incorporated the Mechanics' Institute, and in 1890 the Manchester Whitworth Institute, has proved very completely how a school can be organised to give thorough technical training in the principles and processes of great and complicated industries. The course of studies is generally confined to subjects of commercial and mechanical interest— theoretical and practical engineering, designing, economics, weaving, bleaching, and metallurgy and chemistry. It has also several good lecture-rooms. Every facility is afforded the scholars for acquiring thorough knowledge, theoretical and practical, of the various handicrafts, and the expert use of tools. The guarantee in the章程 for the return of funds to the Charity Commissioners. There are evening classes in connection with the board and technical schools at a moderate rate. As regards the education of the poorer children, the persevering endeavours of the wealthy and benevolent in this direction have been crowned with success. The great revolution in the industrial life of England began here about the middle of the 18th century—the substitution of the factory system, where large numbers of men work together, for the older method of each working in his own homes. New machines were invented, new methods of internal communication, and to meet the rapid increase of trade and commerce many efforts were made in early times to substitute some better means for the pack-horse mode of carriage and conveyance. In 1728 the Irwell was made navigable. In 1756 the Bridgewater Canal was constructed, which put Manchester in communication with the coalfields of Lancashire and the salt-mines of Cheshire, and made an important substitute for the road way for passengers as well as goods. In 1830 Manchester had the first perfect railway in full operation. It has been proved that conveyance by water is only one-tenth of the cost of the same distance by land, and, in order to avoid transhipment of goods, and to render transport easier, the gigantic engineering work of making a ship-channel at a cost of about £15,000,000 sterling was carried out in 1887–93 (see Canal, Vol. II, p. 700). A perfect network of railways and canals radiates from Manchester as a centre in all directions. In consequence of all these gradual changes Manchester is losing its character as merely a manufacturing town. A change is gradually developing in the locality of the various large industries, and the city may be regarded now as the general market for the whole territory of Lancashire. In 1825 there were 35 cotton-mills, and other industries are being removed to the suburbs north and east of the city, and in and around Manchester and Salford two-thirds of the entire cotton-manufactures of the United Kingdom are located. There are about 700 different industries in the district. Manchester is the centre of the cotton trade, and is the largest city in England. The disease of inland bonding for articles charged with customs duties, and now produces a large and increasing revenue from that source. The sanitary condition of Manchester is not a satisfactory one, and in consequence the death-rate, averaging 130 per 100,000, is alarmingly high; but it must be remembered that the corporation had long arrears of neglect and indifference to make up, while a rapid increase of population was going on. Down to 1838 Manchester and Salford were governed by a borough-revee and constables, and from their abolition only could the real work of improvement begin. As instances of the immense works accomplished by the corporations may be mentioned the gas and water supplies, municipal buildings, widening and draining of the streets, and erection of workshops and dwellings. The sewage main drains made since 1838 are 95 miles in length, cross drains and eyes 148 miles, whilst the area of streets paved equals a million square yards. The smoke nuisance is perhaps more difficult to remove now than when the factories were within the city. The disease of the death-dealing river, the Irwell, flowing through a dense population, has yet to be dealt with. Besides the pollution from public works of all kinds it is the receptacle of the sewage from more than one million of a population distributed over the watershed of the Irwell, comprising an area of 300 sq. m. Great efforts are constantly being made to remedy this unfortunate state of matters. Manchester is undoubtedly an ancient city. It is mentioned as a Roman station (Mancenium; in A.S. Manchester), and is part of the Norman Conquest in connection with Salford and Rochdale, but the uncertainty of all trustworthy information, especially as regards its origin, renders any account of its early history a matter of doubtful value. We know that Manchester was an ancient manufacturing district, but it is probable that the introduction of Flemish artificers in the reign of Edward III. is the real starting-point. In the 13th century there was a fulling-mill, and dyeing yarns or cloth was practised. The 14th and 15th centuries were of great progress. Camden, who visited Manchester in the reign of Queen Elizabeth, describes it as
MANCHURIA

Moor. In consequence Cromwell accused him of being a traitor and military insubordination in the House of Commons, and the two had a downright quarrel. The Self-deriding Ordnance deprived Manchester of his command, and this did not allay his bitterness against Cromwell. He opposed the trial of the king, and protested against the Commons of 1659. Afterwards, having been active in promoting the Restoration, he was made Lord Chamberlain, a step designed to conciliate the Presbyterians. He died 5th May 1671.

His grandson, CHARLES MONTAGU, fourth Earl, supported Walpole in his administration of 1721-1722. Manchester extraordinary to Venice (1696), Paris (1699) and Vienna (1707), and was made Duke of Manchester in 1719 for having favoured the Hanoverian succession. He died 26th January 1722.

Manciu-eel (Hippomane mancinella), a tropical American tree of the natural order Euphorbiaceae, celebrated for the poisonous properties of its acid milky juice. A drop of this burns like fire if it falls upon the skin, and the sore which it produces is very difficult to heal. The Indians use it for poisoning their arrows. The fruit is not unlike a small apple; dried and pulverised it is directed for internal use in more severe cases. The wood is well suited for cabinet-making.

Mau~uria, long the north-easternmost portion of the Chinese Empire, is since the events of 1898 so completely controlled by Russia as to be practically the south-eastern corner of Asiatic Russia. "The Country of the Mancius" (see ASIA, CHINA) lies between the Yellow Sea and the Amur, and, lying just beyond the limits of China proper, between Corea and the Russian Maritime Province. The first step in the Russian occupation was the concession by China allowing the deviation of the Siberian railway through Northern Manchuria; then the events connected with the Russification of Port Arthur (q.v.) and Taliwen. Finally it was arranged that the Siberian railway should be connected with Kirin and Mukden, with Peking on the one hand and Port Arthur on the other, and that Cossack garrisons and settlements of Russians along the line should be confirmed.

Mau~uria is said to be 280,000 sq. m.; total pop. 21,000,000. The Chinese recognised three provinces—Kirin in the centre, Feng-tien or Liao-Tung in the south, and Hei-lung-chiang in the north. The eastern and most of the central parts are covered by the irrigated and drained rapeseed plains of the White Mountains, which in the White Mountain itself reach 8000 feet, whilst the northern province is crossed by the Chingan Mountains. The central parts of the country are watered by the Sungari, which rises in the eastern Lake of the Long White Mountains, and after a course of 850 miles joins the Amur in the north of Kirin province. The hills are rich in timber, pines predominating; in minerals, chiefly gold, silver, coal, and iron, of which little has been extracted; and in fur-bearing animals, foxes, lynx, squirrel, tiger, bear, wolf, deer, &c. The Manchurian lark, a clever mimic, is exported in great numbers to China. The rivers swarm with salmon, and trout are plentiful. The climate is temperate in summer, especially whilst the rains which begin in June and continue to September. In winter, the season of traffic, when the streams and extensive marshy tracts are frost-bound; the thermometer frequently falls as low as -27° F. in the northern province in the depth of winter. The soil is exceedingly fertile, and produces in abundance millet (with vegetables the basis of food), maize, hemp, poppy, beans, rice, vegetables, and ginseng. Wild silk is produced. The industry is
confined to the making of furniture, confined to China, and carts, the turning of barrels, the preparation of furs, and the distilling of spirits. A large amount of trade is carried on at the towns in the interior, and especially at the treaty port of New-chwang (q.v.). Beans, bean cakes and oil, silk; gingem, skins and furs, &c. are exported to the interior. The important branches of trade are cottons, woolens, metals, sugar, silk, paper, medicines, opium, &c. imported to $4 million sterling.

The native opium is rapidly supplanting the Indian, the import of which fell from 337,007 lb. in 279 to 12,206 lb. in 1839. Excessive floods in 1888 caused a great deal of damage to crops, but the area not cultivated was, 18,490,000 acres.

The climate is exceedingly malarious, but the hygiene and inoculation in the towns has subdued the disease. The area under cultivation is 10,000,000 acres. The government has placed a tax on all land and the revenue obtained is $22,000,000.

The population is estimated at 2,300,000, about one-third of whom are Chinese. The remainder are of the great Chinese race, and are divided into several tribes, each having its own peculiar language and customs. The language of the Chinese is the official language of the country.

The government of the country is a constitutional monarchy, with a king and a council of ministers. The king is assisted by a council of ministers, which is elected by the people. The council of ministers is responsible to the king.

The capital is Mandalay, which is located on the Irrawaddy River. The city is built on a system of walled fortifications, and is defended by a moat and a parapet.

The city is noted for its beautiful gardens, and for its fine buildings, which are chiefly of teakwood. The government buildings are magnificent, and are surrounded by beautiful parks and gardens.

The manufacturing of teakwood is one of the most important industries of the country. The teakwood is obtained from the teak trees, which are found in the forests of the Irrawaddy Valley. The teakwood is used for the construction of ships, and for the manufacture of furniture.

The chief crops of the country are rice, sugar, groundnuts, and jute. The country is also noted for its fine fruits, such as bananas, oranges, and mangos.

The chief exports of the country are teakwood, rice, sugar, and jute. The chief imports are cotton goods, machinery, and foodstuffs.
the Supreme Court, and is also allowed to the circuit courts, subject to considerable restrictions.

**MANDARIN**

describes the Chinese of several grades by foreigners, derived from the Portuguese mandar, *to command*. For the Chinese governmental authorities, their rank and distinctive buttons, see *China*, Vol. III, p. 191.

**Mandeville, Bernard de**. English satirical writer, though born of Dutch parents at Dordrecht in Holland in 1670. He graduated in medicine at Leyden, after four years of study, in 1691, and immediately afterwards settled in London to practise his profession; he died in that city in 1733. He is known as the author of a short work in doggerel verse entitled *The Bride of the Bois*, which, as finally published in 1723, included the fable itself, called *The Grumbling Hare*, first printed in 1705. *Remarks on the Fable, and Inquiry into the Origin of Moral Virtue*, both added to the 1714 edition, and an *Essay on Charity Schools* and *Search into the Origin of Slang* added in 1725. This book was so because luminant, levelled against the ethical theories of Shaftesbury, who set up as the standard of virtue the ultra-refined tastes of an idealistic refined. Mandeville, writing in a vein of extremely coarse and brutal parody, cynical in its most frequent and striking, affirms that private vices are public benefits, and that every species of virtue is at bottom some form of gross selfishness, more or less modified. Thus he overemphasizes the lesser elements in human nature, traits of Shaftesbury in his defence states that he wrote in irony for the diversion of people of discernment and knowledge, and his words were not to be taken in literal earnest, as it meant for general readers. Nevertheless, his other works, such as *The Virgin Unmasked*, *Free Thoughts on Religion*, etc., detract greatly from the sincerity of this plea. It is worth while observing that his realistic habits of thought bring him in some respects curiously into touch with the exponents of modern scientific methods of inquiry.

*New Lastick Stump*, *Essays on Preachidng* (1753), or a pamphlet volume of the same writer's *English Thought in the 18th Century* (1786).

**Mandeville, Jehan de**. The name assumed by the compiler of a famous book of travels, written in French, and published between 1357 and 1351. Versions in Italian, Spanish, Dutch, Walloon, German, Bohemian, Danish, and Irish are found, and the number of MSS. amounts to at least 200. Many have maintained the priority of the Latin text, which exists in as many as five independent versions, but it seems much more probable that the Latin was the earlier. The earliest edition of the French text was printed at Lyons in 1487. Indeed, it is most probable that the book was written under a feigned name by the physician Jehan de Bourgesigne, otherwise Jehan à la Barbe, who is stated in an early Latin edition to have served as a vassal at Dieppe, and to have persuaded and helped him to write his travels. There can be little doubt that this statement of Bourgesigne's was merely an ingenious blind, and that he alone was the author of the two versions. It has been discovered that Bourgesigne revealed on his death-bed his real name of Mandeville to Jean d'Autremesme, explaining that he had had to flee from his native England for a homicide. We are told further that this physician, who died in 1372, had practised his profession at Liège since 1342. And it is apparently quite certain that in the 16th and 17th centuries a tomb was shown at Liège, with a Latin inscription stating that Mandeville died there in November 1372. An English version was made from an English manuscript which is dated early as the beginning of the 15th century, and two extant independent revisions of this followed within a quarter of a century. The original defective form was printed by Pynson and Wynken de Worde (1495); the editions of 1495 by Halliwell (1839 and 1866) represent one of these later revisions; that first printed for the Roxburghe Club in 1889 is an admirable edition of the other. But the glaring errors of translation render it impossible that either of these forms of the English version can be from the hand which wrote the original work, in spite of the statement in the preface, which has been too easily believed, that it was made by Mandeville himself. None the less it remains an admirable monument of English, but the name of Sir John Mandeville should now disappear from histories of literature as the 'father of English prose.'

In the preface the French compiler describes himself as a knight born at St Albans, who left his native country in 1322, travelled by way of Turkey, Armenia, Tartary, Persia, Syria, Arabia, and India to China, and there visited Jerusalem, and who wrote in Romance as better understood than Latin. In the course of the book we are told further that he had served the sultan of Egypt against the Bedouins, and the emperor of China against the Tartars. He had seen the glory of Prester John and drank of the Fountain of Youth at Palombe (Quilon on the Malabar coast), and returned home unwillingly owing to arthritic gout in 1357.

By far the greater part of the book has now been translated, and is a sort of collection of interpolations, usually extravagant, from the narrative of Friar Odoric (written about 1339); from Hayton, an Armenian who became a Premonstratensian monk, and dictated at Poitiers in 1307 a book about the East in the French tongue; from the work of the Franciscan Carpini from the well-known *Epistle of Prester John*, widely known in the 13th century; from Albert of Aix, Brunetto Latini, Peter Comestor, Jacques de Vitry, Vincent de Beauvais (*Speculum Historiale* and *Speculum Naturali*); from the third, 12th-century Latin itineraries of Palestine; from the *Ensilasquia* of the Englishman William of Boldensele, written in 1336. A small portion of the book may still represent actual travels and personal knowledge, especially in the part relating to the Holy Land; but this does not re-establish the honesty of the writer, who claims himself to have travelled in the remotest regions described, and to have seen with his own eyes the wonders enumerated, while he never mentions Odoric, from whom he conveyed by far the greater part of his book. Among these wonders we find mirrors of stones that turned into women at the touch, and men whose heads grew beneath their shoulders, the phœnix, the vegetable lamb, the weeping crowndile, the garden of transmigrated souls at Canopus (Hang-chou-foo), and the Valley Perilous. Of the Terrrestrial Paradise, however, the writer is candid enough to say that he had not been there.

See the article by Colonel Yule and E. B. Nicholson in *vol. xvi.* (1883) of the *Encyclopaedia Britannica*, and the latter's letter in the *Academy* for April 12, 1884; for all the above, as well as for an analysis of the work of Johann von Mandeville (Berlin, 1888); and the introduction by T. F. Warner to his edition for the Roxburghe Club (1889), in which the views of Dr Vegels and Dr Carl Schauborn are also discussed.

**Mandible**, a name applied to various jaw-organs—e.g. the third pair of appendages in Crus
taceans, the first pair of true appendages in Insects, the lower jaw in Vertebrates.

**Mandingoes** are a Bantu people of Africa, mainly in Senegambia (q.v.). See **AFRICA**, Vol. I. p. 83.

Manfold, or Mandé, a ruined city of India, formerly capital of the Moorish kingdom of Malwa, stands 15 miles N. of the Nerbudda and 38 SW. of Indore. The ruins stretch for 8 miles along the crest of the Vindhyha Mountains, and have a circumference of 37 miles. A deep, narrow valley separates them from the adjoining tableland. The least injured of the ruined buildings is the great mosque, which is reached by a handsome flight of stairs; it is said to be 'the finest and largest specimen of Afghan architecture extant in India.' There are also a massive royal palace and the white marble mausoleum of the king who raised the city to the acme of its splendor (early 15th century). According to Malcolm, Manfold was founded 315 A.D.

*Mandolin*, a musical instrument of the lute family. The body of the mandoline is formed of a number of narrow pieces of different kinds of wood, bent into the shape, and glued together. On the open portion of the body is fixed the sounding-board, with a finger-board and neck like a guitar. The Neapolitan mandoline, which is the most perfect, has four double strings, tuned (beginning with the lowest) G, D, A, E. The Milanese mandoline has five double strings, tuned G, C, A, D, E. The sound is produced by a plectrum in the right hand, while the left hand produces the notes on the finger-board. The mandoline is chiefly used for accompaniment.

*Mandrake* (Mandragnia officinalis), a Solanaceous plant closely allied to Belladonna. There are two varieties, the vernal and the autumnal; both are natives of the Mediterranean region and the East, and especially abound in Greece. The whole plant has a very fetid narcotic smell; and all parts have poisonous properties like those of belladonna, but more narcotic, for which reason a dose of the root was formerly sometimes given to patients about to endure surgical operations. The ancients were well acquainted with the narcotic and stupefying properties of mandrake, and it was a common saying of a sleepy or indolent man that he had eaten mandrake. The large taproot grows somewhat irregularly, and is said to be mistaken for a root of a tree, hence the name. The root of the mandrake (Mandragnia officinalis) is often confused with the development of a branch which attains more or less equal size. Hence arises a rude resemblance to a human figure; and this is, as a matter of fact, easily exaggerated by a little judicious pruning or carving, and by trimming the covering of fine hair-like roots. Hence Pythagoras speaks of the mandrake as anthropomorphe. To such mannikin-figures many magical virtues were ascribed; by the ancient Germans they were supposed to bring luck to their possessors, who accordingly dressed and tended them like dolls, yet kept them reverently ensnirned in caskets, and thus obtained their services for the henchman of the house, or of an absent man and beast, for the divination of the future, or for the rendering of supplies of money. From the most ancient times aphrodisias virtues have been ascribed to mandrake, which was therefore supposed to cure barrenness (see Gen. xxx. 14–16); such repute is hardly borne out by the actual properties of the root (which would, however, relax the womb), but probably more commonly depended on its magical associations as a phallic figure. The extremely narcotic and poisonous properties of the plant could not but invest these figures with a more grim significance, of which the medieval imagination made the most. So large, deep, and well fixed a root needs some labour to dig out, and, if torn up by main force, breaks with more or less noise, hence the ancient legend that the mandrake shrieks when torn out of the ground. The subsequent possibilities of accident (not to speak of misuse) can easily be imagined, not only from the sweet and attractive berries, but the leaves, root, or even juice. On the base of caution there arose a whole fantastic ritual: the plant could only be safely dug up by daylight; if the plant was handled carefully digging should be dragged out of the ground by a black dog, which served as a vicarious substitute for the herbalist, in dread of the mandrake's vengeance.

Mandrill. See BABOON.

*Manduria*, a town of Southern Italy, 22 miles E. by S. of Taranto, near the ancient town of Manduria, of which the most important relics are still extant. Pop. 8865. In 1790 it exchanged its name of Casalnuovo for Manduria.

*Mandvi*, the chief seaport of the principality of Cutch, in India, on the north shore of the Gulf of Cutch, 36 miles SW. of Bhuj, the capital. It has a good roadstead and a breakwater, but the harbour is choked with sand. The pilots are in request all through the state. Pop. (1881) 33,080; (1891) 38,155.

Manes. See LARES.

Manet, ÉDOUARD (1832–83), a French painter, the founder of Impressionism (q.v.). See his Life by Bazire (Paris, 1884).

Mandred, regent and king of Sicily, was a natural son (afterwards legitimised) of the Emperor Frederick II. by Bianca, the daughter of Count Lucian, and was born in 1231. On his father's death in 1250 he received the principality of Tarentum, and in the absence of his half-brother, Conrad IV., acted as regent in Italy. He bravely defended his sovereign's interests against the aggression of Pope Innocent IV.; and after Conrad's death he was acknowledged as regent of Apulia, in name of his nephew Conradin (q.v.). The pope, however, renewed his pretensions to Apulia, and compelled Manfred to flee for shelter to the Saracens by whose aid he defeated the papal troops, and became, in 1257, master of the whole kingdom of Naples and Sicily. On the rumour of Conradin's death he was crowned king at Palermo, 11th August 1258, and immediately afterwards was excommunicated by Pope Alexander IV, along with his adherents: but Manfred invaded the papal dominions, and made himself master of the whole of Tuscany. His power now seemed secure, and his government was at once mild and vigorous. But this tranquillity was not of long duration. Pope Urban IV., renewed the excommunication
against him and his friends, and bestowed his dominions as a papal fee on Charles de Bourbon, the brother of Frédéric. Manfred, though at first successful in the war which ensued, was at last treacherously defeated, and slain in a bloody battle at Benevento, 26th February 1266. His lady was interred as that of an excommunicated person. His widow and children were afterwards treated by the Fugger family; the widow and three sons died in prison; the daughter was confined for twenty-two years. His history has been made the subject of drama and opera. See Cesare, Storia di Manfredi (1837); Schirrmacher, Geschicchte der letzten Hohenstaufen (1871).

Manfredonia, a seaport and military station, and chief town in the district of South Karas, in the presidency of Manfredonia, Italy. A clean, picturesque town, it is situated in a vast plain, in the Gulf of Manfredonia, a bay on the Adriatic Sea, 13 miles by rail NE of Foggia. Founded by Manfred in 1201 from the ruins of ancient Sidumium, it has an old castle and a cathedral. Pop. 3324.

Mangalore, a seaport and military station, and chief town in the district of South Karas, in the presidency of Manfredonia, India. A clean, picturesque town, it is situated in a vast plain, in the Gulf of Mangalore, a bay on the Arabian Sea, 23 miles by rail NE of Foggia. The total trade reaches an annual average of nearly £80,000 in value. Pop. (1861) 42,922, including a large body of Catholic Indians who have become bishops and college. Mangalore is also the headquarters in India of the Basel Mission, the members of which teach their people to weave cloth, print and bind books, and make roof tiles. The town, which was three times sacked by the Portuguese in the 16th century, was taken by Hyder Ali in 1763, and made the headquarters of his navy. In 1784 its English garrison yielded to Tipoo Sultan after a nine months' siege. It became British in 1799, and was burned by the Coor rebels in 1837.

Mangan, James Clarence, a gifted but hapless Irish poet, who was born in 1803, and employed for many years in the drudgery of copying in an attorney's office. His heart was framed for suffering, and his whole life was a tragedy of hapless love, poverty, and Intemperance, until he found rest and safety in a religious life. He died on 20th June 1849. There is fine quality in his original verse, as well as in his translations from the German, but more especially from the old Irish, as in the impassioned ballad of Dunk Rowerne.

His Poems were published at New York in 1839 and 1852, with an introduction by Mitchell, in which selections and study (1897), affirmed Poe's indebtedness to Mangan's recurrent refrain; the standard Life is D. J. O'Donoughue's (1899).

Manganese (symbol Mn; atomic weight, 55) is one of the iron group of heavy metals. It is darker than wrought iron, is capable of a high degree of polish, and is so hard as to scratch glass and steel. It is only freedly attracted by the magnet, and oxidizes readily on exposure to the air. The metal occurs in nature in small quantity along with iron in meteoric stones, but may be obtained in large amount by the reduction of its sesquioxide or carbonate by charcoal at an extreme heat.

With oxygen it forms six compounds: manganese oxide, MnO; manganese oxide, MnO₂; manganese-manganic oxide, MnO₂; manganese dioxide, MnO₂; manganese anhydride, MnO₂; and manganese anhydride, MnO₃. Like iron it forms proto-salts, MnCl₂ and per-salts, MnOCl₂. It also forms salts derived from an acid, H₂MnO₄, such as potassium manganate, KMnO₄, and from an acid, H₃MnO₆, as potassium permanganate, KMnO₄. The natural alteration of iron, in which manganese is formed in nature, and is the general source of the other compounds. It is known to mineralogists as pyrolusite, and in commerce as black manganese or manganese simply. When heated alone or with sulphuric acid it gives off oxygen, and when heated with hydrochloric acid chlorine is evolved. It is largely used in the manufacture of glass, to which it imparts a purple colour. It is also used for staining the colouring matter of paper. Manganese oxide, MnO₂, is an olive-green powder. Its salts are colourless, or of a pale rose colour. The sulphate, MnSO₄, in pink crystals, is largely used by the calen-printer for the production of black and brown colours, and in the decomposition of blue and green dyes.

Manganese anhydride, MnO₂, in octahedral crystals, forms the mineral branntie, and in the hydrated form, MnO₃·H₂O, the mineral manganite.

Red oxide of manganese, MnO₂, is formed when any of the other oxides are heated in the air. It is found in nature as the mineral hahnmansite.

Manganese anhydride, MnO₂, is only known in solution or in a state of combination. Its solution is of a splendid red colour, but appears of a dark violet tint when seen by transmitted light. The permanganate of potash, KMnO₄, which crystallizes in reddish-purple prisms, is the most important of manganese salts, and is largely employed in analytical chemistry, and is the basis of Condy's Disinfectant Fluid.

Manganese is a constituent of many mineral waters, and is found in small quantity in the ash of most vegetable and animal substances. It is almost always associated with iron. Various preparations of manganese have been employed in medicine. The binoxide has been used as a substitute for bismuth in dyspeptic affections, while various preparations have been tried as substitutes for tannin in blackening the hair. The permanganate and permanganate of potash readily part with their oxygen, and in weak solution are used as disinfecting and astringent lotions.

Mange, a contagious disease in horses, dogs, and cattle, is, like scab in sheep, very similar to itch in the human subject, consisting of minute itches or scabs. Some of these burrow in the skin, others move about upon the skin, especially if it be dirty or scurfy, and cause much irritation, heat, and itching, and the eruption of minute pimples, with dryness, seariness, baldness, and bleeding of the skin. The treatment consists in destroying the scab, and in maintaining the cleanliness and health of the skin, both of which objects are effected by washing the parts thoroughly every second day with soft soap and water, and dressing daily with sulphur or mild mercurial ointments, or with a solution containing four grains either of corrosive sublimate or arsenic to the ounce of water. Castor oil seeds, bruised and steamed for twelve hours in buttermilk, are very successfully used by the native Indian farmers. Where the heat and itching are great, as in cases of scabies of the ears and eyes, the application of belladonna may be used to the usual dressing, or applied along with a little glycerine. Where the general health is indifferent, as in chronic cases, the patient should be liberally fed, kept clean and comfortable, have an occasional application of an simple saline medicine, such as nitre or common salt, and a course of such tonics as iron or arsenic. Cleanliness and
Mangosteen, produced by Garcinia mangostana (natural order Clusiaceae), is considered the most delicious and wholesome of all fruits. The tree, which is a native of the Moluccas, grows about 20 feet high in very regular symmetrical form. The leaves are large, oval, entire, deep dark green above with a dull iridescence, olive-green below. The open flowers resemble those of a rose, but the fruit in size and shape. The fruit resembles a middling-sized orange; it is dark brown, spotted with yellow or gray, has a thick rind, and is divided internally by thin partitions into cells. The pulp is soft and juicy, of a rose fragrance, refreshing and agreeable, with a mixture of sweetness and acidity, and has an extremely delicate flavour. It may be eaten very freely with perfect safety, and is esteemed very beneficial in fevers. It is cultivated in Java and

Mangold-wurzel, or Mangold, a German name in general use in Britain and America to designate the varieties of the common beet (see BEET) cultivated in fields for feeding cattle—Beta vulgaris of the natural order Chenopodiaceae. A field beet and leaf beet chiefly in being larger in all their parts, and coarser. They have large roots, which in some of the varieties are red, in others greenish or whitish, in some carrot-shaped, and in others nearly globular. The cultivation of mangold as a field-crop was introduced from France into England in 1786. At first, so little was its value known, that the leaves alone were used as food for cattle. Its importance, however, was soon appreciated, and it rapidly gained favour. It is much more patient of a high temperature than the turnip, liable to fewer diseases, and vastly more productive under favourable conditions. In highly-manured grounds in the south of England as much as from 80 to 70 tons to the acre have been raised; throughout the south of England it is generally admitted that it is as easy to grow 30 tons of mangold to the acre as 20 tons of Swedish turnips. The lowest culture of the Scotten-mangolds, as they are termed, grown by digging from perennial weeds, it is often previously well manured. Mangolds are sown both in rows on the flat ground and in drills raised by the plough—the former from 18 to 25 inches apart, and the latter from 25 to 28 inches wide. From 12 to 16 tons of dung with 9 to 12 tons of superphosphate, 2 to 3 cwt. common salt, and 2 to 3 cwt. nitrate of soda per acre are common dressings for mangolds. Indeed, this crop can hardly be over-manured. It requires 6 or 7 lb. of seed to the acre; and, as the grains are enclosed in a hard and rough coat, they are steeped in water for two days previous to their being planted, for the purpose of promoting a quick and regular "braid." The long red, the round red, and the orange and yellow globes are all favourite varieties in England. As soon as the plants are about 3 inches above ground, they are singled out by the hand, and their cultivation is afterwards the same in all respects as in the case of Swedish turnips. The crop should always be stored by the end of October, and should not be consumed till the following spring, by which time the roots have lost their tendency to mangle in animals, and have greatly improved in feeding value. Care has to be taken not to injure the leaves or bulbs, as they are liable to suffer from "bleeding." The roots are stored in pits or "clamps," covered with straw and a little earth, as a protection in severe weather.

Mangnall, or Ballista, see BAILLISA.
in the south-east of Asia; it has recently become common in Ceylon, and has been successfully introduced into other tropical countries.

Mangrove (Elaiophorae), a genus of calyciflorous dicotyledons, including about fifty species, of which the indistinct affinities have constituted a separate order (Elaiophoraceae). They are trees and shrubs, all tropical (especially South American), and natives of coasts, particularly about the mouth of rivers, where they grow in the mud, and form a close thicket down to and within the margin of the sea, even to low-water mark, forming the characteristic mangrove-swamps so often described by travellers and naturalists. Most species send down roots from their branches, and thus rapidly extend over large spaces, forming secure retreats for multitudes of aquatic birds, whilst crabs and shell-fish are also to be found in them in vast numbers. Their interlacing roots retain mud, seaweed, &c., and thus rapidly form soil and encroach upon the shallow sea; on the north coast of Java and elsewhere their geological importance is specially marked. The seeds have the peculiarity of germinating before the fruit has fallen, a long thick radicle proceeding from the seed, piercing its covering, and extending rapidly downwards. When the fruit drops, the stout heavy radicle pierces the mud, and the young tree is thus planted in the proper position forthwith. The fruit of the common mangrove (R. Mangier) is sweet, edible; and its juice, when fermented, yields a light wine. The bark is sometimes imported for the sake of its tannin, in which all the species are rich. Mangrove wood is also imported from the West Indies. The Chinese and East Indian species (R. Gymnochloris, &c.) are of similar habit and properties; some of the latter are separated as a distinct genus, Bruguiera.—The so-called White Mangrove is Avicennia (q.v.).

Manhattan Island, the island on which the great part of New York city stands.

Mania. See Insanity.

Manica, a gold-field long worked by the Portuguese, 130 miles NW. of the port of Sofala, and now mostly included it the British sphere of influence as an eastern section of Mashonaland (q.v.). It is intersected by the railway from the Pungwe River (near Beira) to Fort Salisbury.

Manichaeus, or MANI, the founder of the sect of the Manichaeans, who, according to the Mohammedan and most trustworthy tradition, was born at Elecatana about 215 A.D., and educated at Ctesiphon under his father Uitak, who joined the sect of the Maghtaish (Baptists) in which his son was brought up. This sect was connected with the Manichaeans (q.v.), and most probably also with the Elkesiates and Hemerobaptists, and may also have borrowed something from Christianity. At about the age of thirty Mani began to proclaim his new religion in the heart of the old world, Sapor I., and then undertook long missionary journeys, returning to the court about 270. Pursued by the enmity of the Magians he was obliged to flee, was protected by the next king, Hormazd, but under his successor, Habran I., was abandoned to the hatred of his enemies, which condemned him in 276 and flayed his lifeless body. His numerous epistles and writings are lost, and we know of them only from the Arabic catalogue, the Fihrist, and from allusions in Epiphanius, Augustine, and Photus.

Manichæism was a great religions system that sprung up in western Asia about the close of the 3d century, and which, although it utterly disclaimed being denounced Christian, yet was reckoned among the heretical bodies of the Church. It was not an offshoot from Christianity, but was based on the ancient Babylonian religion, and was thus really a Semitic religion of nature modified by Christian and Persian elements, systematised and, elevated into a gnosti, and made applicable to human life by a deduced system of ethics. But, while it borrowed nothing from Christianity proper, it derived part of its terminology and some of its conceptions from Christianity as developed among the sects of the Basilidians, Marcionites, and Haranites. The Western Manichæans adopted many Christian elements which were not present in the original system of its founder nor in its purer Eastern development. It is possible, although it has not yet been satisfactorily proved, that it borrowed some elements from Buddhism. Mani was the first to work out the theory of a Buddhist element, and was followed by Neander, Hilgenfeld, and other scholars; but his argument has been assailed by Le Page Renouf, Zeller, Lightfoot, and Harnack. Manichæism was essentially a complete dualism, materialistic in so far as the physical and ethical were concerned, but in its chief principles, says Harnack, was due to the fact that it united an ancient, Oriental, Jewish and a thorough-going materialistic dualism with an exceedingly simple spiritual worship and a strict morality. As has been said, it assumed two chief principles, whence had sprung all visible and invisible creatures and which were absolutely antagonistic in their natures—were respectively styled the Light, the Good, or God, and the Darkness, the Bad, Matter, or Archon. They each inhabited a region akin to their natures, and excluding each other to such a degree that the region of Darkness and its leader never knew of the existence of that of the Light. Twelve signs—corresponding to the twelve signs of the zodiac and the twelve stages of the world—had emanated from the Primeval Light; while Darkness, filled with the eternal fire which but shot not, was peopled by demons, who were constantly fighting among themselves. In one of these contests, pressing towards the outer edge, as it were, of their region, they became aware of the neighbouring region, with which they longed to be united, that they attacked it, and succeeded in carrying the edge of the Land of Light that was sent against them at the head of the hosts of Darkness and which was the embodiment of the Ideal or Primal Man. The God of Light himself now hastened to the rescue, and with the help of new forces defeated Darkness and set free the primal man in his greater and better form. The smaller and fainter portion, however—the Jewels of Light of the Western Manichæans—remained in the
hands of the powers of Darkness, and out of this they formed, after the ideal of the Man of Light, mortal man. But even the small fraction of light left in the two souls which they now possess, have per
vailed against them, had they not found means to further divide and subdivide it by the propagation of this man. Thus man was originally formed in the image of Satan, but contained within him a spark of the heavenly light, which awaits its final death in the convertion of man from his birth among the dark-
ness. The demons sought to obscure it further by sensuality and dark forms of belief and faith, such as Paganism and Judaism; but the spirits of Light are constantly engaged in drawing out the dimmed and buried light hidden in the world, by opening up to men the true gnos is of nature, and winning them away from sensuality and error. Thus there appeared in the world a succession of teachers, as Adam, Noah, Abraham, and probably Zoroaster and Buddha. Jesus also was such a teacher, but he was neither a teacher of sensuality, nor of Messianic Christianity, but a phanomenal Jesus (Jesus inpaptibilis), who did not actually suffer, as he seemed, on the cross, but only allowed himself to become an example of endurance and passive pain for his own, the souls of light. Since evidently the inferior spirits, or even angels, were not strong enough to suffer as he had commanded them, he promised them a Paraclete, who should complete his own work. This Paraclete was Mani, who surrounded himself, like Christ, with twelve apostles, and sent them into the world to teach and convert the damned soul of the world to light. This paraclete, to the last end of the world will be fire, in which the region of Darkness will be consumed.

To attain to the region of eternal light, it is necessary that Passion, or rather the Body, should not be utterly sublated; hence rigorous absti
nence from all that is pleasant to the senses, in fact, to the utmost degree—is to be exercised. The believers are divided into two classes—the Electi (Perfecti) and the Catechumeni (Auditors). The Elect have to take the oath of abstainence from evil and profane specie (including religious terms of Christianity, such as Christians use respecting the Godhead and religion), and from flesh, eggs, milk, fish, wine, and all intoxicating drinks; from the possession of riches, or, indeed, any property whatsoever; from hurting any being—animal or vegetable; from heedless or profane use of the mysteries of the church, and in short, from being a Manichæan. The Auditors have to take that oath, except with regard to marriage or other otherwise. The Auditors were comparatively free to partake of the good things of this world, but they had to provide for the subsistence of the Elect, and their highest aim also was the attaining of the state of their superior brethren.

In this Manichean worship, the Visible Representa-
tives of the Light (sun and moon) were revered, but only as representatives of the Ideal, of the Good or supreme God. Neither angels nor men, nor any other creature was to be found in their places of religious assem-
bies, nor did they erect summptuous temples. Feasts, prayers, occasional readings in the supposed writings of Mani, were all their outer worship. The Old Testament they rejected unconditionally; of the New Testament they retain portions, as revised and redacted by the Paraclete. Sunday, as the day on which the visible universe was to be consumed, the day consecrated to the sun, was kept as a great festival; and the most solemn immediate act, their great prayer was on the 21st day of the month of the death of Mani. The later Manicheans cele-

The outward history of the sect is one of almost continuous persecution. Yet it spread rapidly from Persia and Mesopotamia to Syria, northern Africa, and even Constantinople and Rome, drawing adherents from the remnants of the old Gnostic sects, especially from the Marcionists and Valentinians, and from the two sons of a rationalistic temperament who were repelled by such dogmas as that of the Incarnation. Both the Roman and Byzantine emperors enacted stringent laws against the Manicheans, the most severe being that of Valentinian III, and Justinian. Pope Leo the Great persecuted them in Rome, and in northern Africa they were exter-
molated by the Vandals. But their peculiar doc-
trines lingered on into the middle ages, and influenced many sects, as the Priscillanists, Pauli-
cians, Bogomiles, Catharists, and Arians.

See Beaucroix, Hist. critique de Maniche et du Mani-
chisme (1724); Baur, Das Manich. Religionssystem (1831); Flieg., Mani (1862); Kessler’s Untersuchung zur Genesis des Manich. Religionssystem (1876), and his excellent articles, ‘Mani’ and ‘Manichaeism,’ in vols. 1862 of Herzog-Pitri’s Real-Encyclopädie; Geyler, Das System des Manichäismus (1875); also Harnack’s admirable article in the Encyclopedia Britannica.

Manihiki Islands, a group of low, wooded atolls, scattered between the Marquesas and Union groups; total area, 55 sq. m.; pop. 1600. Most of them (Caroline, Malden, Starbuck, Pehrn, &c.) belong to Britain.

Manila (by English people often spelt Manilla), chief town of the Philippine Islands (q.v.) and, till the blockade by a United States fleet in May 1898 and the subsequent American occupation of the Philippines, capital of the Spanish possessions in eastern Asia, stands on the east side of a wide bay on the SW. coast of Luzon, 650 miles SE. of Hong-

Manila (by English people often spelt Manilla), chief town of the Philippine Islands (q.v.) and, till the blockade by a United States fleet in May 1898 and the subsequent American occupation of the Philippines, capital of the Spanish possessions in eastern Asia, stands on the east side of a wide bay on the SW. coast of Luzon, 650 miles SE. of Hong-
kong, with which it is connected by telegraph (1881). It is divided into two portions by the little river Pasig, which is crossed by two bridges, the ancient town (found in 1571 by Legazpi), surrounded by crumbling walls, with tolerably wide straight streets crossing each other at right angles. Here are the archbishop’s palace, numerous churches and monas-
teries, the cathedral, mint (closed in 1890), universi-
ty, despatches, etc. It is hot, the temperature in the sum-
time being 82° F.; but during the rainy season (May to November) it ranges from 65° to 68°. Since 1863 the city and suburbs have been lighted by elec-
tricity. The total population is estimated at about 300,000, for the whole empire there are 2,000,000 Chinese, large numbers descended from these two races, and about 5000 Spaniards. The people are fond of dancing and music; but the predominant passions of the native population are cock-fighting, carried on in licensed cockpits, which yields a large revenue to the govern-
ment, and betting and gambling. Almost the only indu-
try is the manufacture of cigars, which employs 21,000 women and 1500 men. The harbour is not very safe during south-west and north-east winds, although shelter is afforded by a small breakwater, and improvement works were in operation for ten
years until suddenly stopped in 1899. Large ocean-going vessels anchor at the naval station of Cavite, 2 miles to the south-west. A railway was commenced from Manila to Dagupan, a distance of 120 miles, in 1897, and was opened in November 1898. The principal exports, which have been the same ever since the establishment of the Philippines, are sugar, manioc, tapioca and tobacco. Manila has an annual import trade valued at approximately $2,400,000, and an export trade that falls but little short of that of sugar. Sugar, hemp, cigars and tobacco, and coffee account for three-fourths of the exports, and cotton goods, rice, wine, silk, and flour figure most prominently amongst the imports. Nearly one-half of the trade is carried on under the British flag, one-fourth under the Spanish, and one-seventh under that of the United States. The Spanish authorities were very jealous of foreigners settling in Manila, especially of Chinese. The city suffered from a great fire in 1883, shared in the revolution that began in 1896, and saw in its harbour the destruction of the Spanish fleet by the American commodore Dewey in May 1898. For "Manilla Hemp," see Abaca.

Manin, Daniele, an Italian patriot of Jewish descent, was born 13th May 1604 at Venice, studied law, and subsequendy joined the army under Venetian command.

Manioc, Manioc, or Cassava (Manihot utilissima), a plant of the natural order Euphorbiaceae, a native of tropical America, and in other tropical countries. Manioc, or Mandioc, is the Brazilian name, Cassava the West Indian and in Peru and other parts of South America the name is Yuca. The plant is shrubby, with brittle stems 6 to 15 feet high, and crooked branches, at the extremities of which are the large pale yellow or green flowers. The root is tuberous, of immense size, weighing often as much as 30 lb. The milky, acid juice which permeates every part of the plant is a deadly poison. In its fresh state, owing to the presence of hydrocyanic acid, which is quickly dis- solved by heat. The juice, imprisoned by boiling, forms the excellent sauce called Cumrew (q.v.), and fermented with molasses yields an intoxicating beverage called Oxigun; whilst the root, ground up into flour, to which a little water has been added, is eaten by the natives, and is also used in South America, and there very generally known as Farina (Port., "meal"). It is made into thick cakes, like the oatmeal-cakes of Scotland, which are formed, however, not by mixing it with water, but by the action of heat softening and agglutinating the particles of starch. It is also imported into Britain, to be used in manufactories as starch. The true starch of manioc, separated in the ordinary manner from the fibre, is known in Brazil as Arroz-cotto. From it tapioca is made, by heating it on hot plates, and stirring with an iron rod; the starch grains burst, some of the starch is converted into dextrins, and the whole agglomerates into small irregular masses. The Pearl Tapioca of the shops, consisting of small, perfectly round, firm grains, is a product of manioc but of potato starch.—Another species or variety of manioc is also cultivated, the roots of which contain a perfectly bland juice, and are eaten raw, roasted, or boiled. This, the Sweet Cassava or Sweet Yuca (M. Apon, said to be a native of Africa as well as of America), has the root of longer shape than the common or bitter cassava, and smaller. The manioc is easily propagated by cuttings of the stem, and is of rapid growth, attaining maturity in six months. The produce is at least six times that of wheat.

Manipur, native state in the north-east of India, occupying some 8000 sq. m. of the most part heavily timbered mountain-land between Burma, Assam, Chittagong, and Cachar; pop. 221,000, collected most thickly in one valley, 650 sq. m., situated 2500 feet above sea-level. The men are lazy, but very fond of Polo (q.v.). The Manipuris combine Mongolian and Aryan characteristics, and are mainly Hindus. A British political agent was established at the rajah's court in the town of Manipur or Imphal (pop. 40,000) in 1833. In March 1891 Mr Quentin, chief-commissioner of Assam, accompanied by an escort of Ghoorkas, came either in March on a mission; and he and Mr Grimwood, the resident, were overpowered and killed. A British military expedition reached the capital the end of April; and after trial, the Rajent and a prince were transported for life, and the "Senaputy" and chief-general executed. See Mrs Grimwood, My Three Years in Manipur (1891).

Manis. See Panonol.

Manissa, Asia Minor. See Magnesia.

Manistique, capital of Manistee county, Michi
gan, is on Lake Michigan, at the mouth of the Manistee River, 135 miles NW. of Lansing. It has several foundries, ten salt-works, and a large num-
er of lumber-mills. Pop. 2080.

Manitoba, a province of Canada, bounded on the W. by the district of Assiniboia, on the N.W. and N. by the districts of Saskatchewan and Keewatin, on the E. by the province of Ontario and the unorganised territory east of Keewa-
tain, and on the S. by Minnesota and North Da-
Kota. The province is traversed by several rivers, among others the Assiniboine, with its many tribu-
taries, the chief of which are the Souris, the Pem-
bina, and the Red River. The Winnipeg River flows for 60 or 70 miles through the eastern portion of the province into Lake Winnipeg. The principal lakes are Winnipeg, 8200 sq. m. ; Manistee, 1900 sq. m. ; and Winnipegosis, 1560 sq. m. The country consists for the most part of a level plain, with occasional undulations. A good deal is said (and a good deal is true) about the fertility of the soil. The summer season is of the same length and temperature as that in the state of New York. In winter the thermometer occasionally sinks to 30°, 40°, and 50° below zero; but these extreme temperatures are very rare. The atmosphere is bright and dry, and the cold is not so much felt as in many countries with a higher temperature, being tempered by the atmosphere. Warm clothing—especially when driving—and warm houses are necessary to resist the severity of the weather. Very little snow falls on
the prairies, the average depth being about 18 to 24 inches; the native horses graze out of doors all the winter. Ploughing generally begins during April. The crops are wheat, potatoes, flax and September. Trees are found along the rivers and streams, and in greater abundance in the eastern and northern parts of the province; but Manitoba is not well wooded.

The population in 1891 was 154,442—Presbyterians 54,874, Anglicans 50,802, Methodists, 28,437; Roman Catholics, 20,571; Baptists, 16,112. Pop. in 1886, 108,640, classified as follows: of English origin, 25,349; Irish, 21,180; Scotch, 25,676; Indians, 5575; half-breeds, 7985; French, 6821; Germans, 11,082; Icelanders, 2408.

Among the principal cities and towns are Winnipeg, Brandon, Selkirk, and Pembina. The chief industry is agriculture; the soil is of remarkable depth and fertility, and in favourable seasons the crops are large; the imperfect methods of cultivation practised in Manitoba are regarded as the finest in the continent. Much of it is bought up by American millers, the product being mixed with flours made from grain produced in the United States. Other grains succeed admirably, and an immense amount is being grown to encourage the growth of flax. Vegetables and roots are unusually prolific and of great size. Wheat-growing was for some few years the staple industry; but the farmers are now engaged more in mixed farming, including dairy-farming and the raising of cattle and sheep. Fruit-growing is not carried on to any extent, although many of the smaller varieties—such as the strawberry, black and red currant, raspberry, gooseberry, and cranberry—appear to be indigenous. In minerals the province is not very rich, but coal is found in southern Manitoba and north of Lake Winnipeg. Manufactures of various kinds are increasing; and Winnipeg is to a large extent the distributing centre for the western part of the Dominion. Big game is still found in the less accessible parts of the province—moose, bear, and some kinds of deer. Small game is plentiful—principally prairie chicken and wild duck. Close times are provided for the protection of all the principal wild animals and birds. A considerable fishing industry is carried on in the rivers and lakes, and whitefish and pickerel are the most abundant of the fish. Of the imports into the province, nearly half comes from the United States. The exports, animals and their produce, are sent to Britain and the United States.

The government is administered by a lieutenant-governor, appointed by the governor-in-council. He is assisted by an Executive Council and a Legislative Assembly of forty members elected by the people. There is only one House of Parliament in Manitoba. The province is represented by four members in the Dominion's House of Commons. Serious difficulty arose between the Canadian government and the provincial administration in regard to education. The Catholics of Manitoba had till 1890 separate schools, but in that year denominational schools were abolished by the local Act. A Canadian-American convention was held in 1891 by the clergy of the two churches, but they were unable to agree upon any plan. Agitation for their restoration was vigorously carried on; the Dominion government interfered to protect the privileges of the Catholic minority, and ultimately in 1896 a compromise was arrived at.

In Manitoba the Dominion government offers free grants of land,—100 acres—to every male settler above eighteen years of age, and to every female who is the head of a family. There is still a considerable quantity of government land undisposed of in the north-western and north-eastern parts of the province. The Canadian Pacific Railway Company, the Canada North-west Land Company, the Manitoba and North-Western Railway Company, and the Imperial Bank of Canada have purchased a considerable quantity of land for sale in different parts of the province, the price ranging from $2.50 up to $7 or $8 per acre, according to locality and contiguity to railways and settlements. A large land grant has also recently been promised to the Hudson Bay Railway Company. Their farms are to be held on reasonable terms at moderate prices. The Dominion Lands Commissioner is established in Winnipeg, and there are land and immigration agents in different parts of the province.

Manitoba is in communication by rail with the Atlantic seaboard and the Pacific, and with all parts of Canada and the United States. The construction of the Canadian Pacific Railway—completed in 1885—has naturally been of immense advantage to the province.

Manitoulin was a continuation of the United States system from Pembina to Winnipeg, and was opened in 1879. The Northern Pacific Railway has direct connection with Winnipeg and Brandon; and a railway is projected from Winnipeg to Hudson Bay.

Until 1868 what is now known as Manitoba formed a portion of the territory under the control of the Hudson Bay Company. The first agricultural settlement in the country was formed in 1812, under the auspices of the Earl of Selkirk, who took out a party of Highlanders in Wilses. They were located at Kildonan and Selkirk, on the Red River, about 20 miles north of the present city of Winnipeg. In 1868 the company gave up their exclusive rights to the government of the territory, and certain concessions were made, including grants of £300,000 and a considerable grant of land. The province of Manitoba was constituted by an Act passed in 1870. One of the first events of importance that happened in Manitoba was the establishment of the Legislative Assembly. The government has been able to provide some of the inhabitants that their position and rights had not been sufficiently considered in the transfer already mentioned. The rebellion collapsed in 1870 on the arrival at Fort Garry, the site of the present city of Winnipeg, of the expedition under Grant, and after a few days' fighting, the insurgents were dispersed. Most of the leaders in the rebellion were subsequently amnestied. The progress of Manitoba from an agricultural point of view has been somewhat remarkable, but its political history has been comparatively uneventful, excepting for the existence of occasional friction between the provincial and Federal authorities since 1880, in connection with railway extension in the province. After protracted negotiations these differences have, however, been disposed of.

References may be made to the following works: Prince's Manitoba (1882); Christie's Manitoba Described (1885); Macoun's Manitoba and the Great North-west (1883); Grant's Ocean to Ocean (1875); Prince's Canadian Agriculture (1885); Official Handbook to Canada (1890); Haydon and Selwyn's North America (1883); A Canadian Tour (1886); The Statistical Yearbook of Canada (Ottawa, 1890).

Manitoulin Islands, a chain of islands in Lake Huron, separating it from Georgian Bay. The principal are Grand Manitoulin (20 miles long
and 28 wide), Cockburn Isle, and Drummond Isle; the last belongs to the state of Michigan, the rest to Ontario. All are irregular and striking in their forms; the Great, Grand, and Cockburn are covered with large forests of pine. Pop. about 2000.

Manning, capital of Manitowoc county, Wisconsin, lies at the mouth of the Manitowoc River, on Lake Michigan. 77 miles by rail. N. of Milwaukee. In 1856 a good harbor was opened, and lumber is actively carried. Timber is sawed, and furniture, machinery, castings, and leather are manufactured. Pop. (1890) 7710; (1900) 11,785.

Mankato, capital of Blue Earth county, Minnesota, on the right bank of the Minnesota River, 86 miles SW. of St. Paul. Three lines of railway pass, and small steamboats can ascend as far as this point. The town contains a state normal school, Roman Catholic college, &c., and has varied manufactures. Pop. (1890) 8384; (1900) 10,599.

Mann, Horace, American educationalist, was born at Franklin, Massachusetts, 4th May 1819, graduated at Brown University in 1839, and commenced the study of law. He was elected in 1857 to the legislature of Massachusetts in 1827, and succeeded in founding the state lunatic asylum. Removing to Boston, he was elected (1833) to the state senate, of which he became president. After editing the revised statutes, he in 1849 presided over the committee on the organization and secretary of the Board of Education. He gave up business and politics, and devoted his whole time to the cause of education, working usually fifteen hours a day. In 1843 he made a visit to educational establishments in Europe, and his Report was reprinted both in England and America. In 1848 he was elected to congress, as the successor of John Quincy Adams, whose example he followed in energetic opposition to the extension of slavery. In 1853 he accepted the presidency of Antioch College, at Yellow Springs, Ohio, where he laboured until his death, August 2, 1862. See his Life and Works (5 vols. 1888), and Hindle's Horace Mann and the Common School System (1898).

Manna, a concrete saccharine exudation obtained by making transverse incisions into the stems of cultivated trees of Exoticus Orumus. The mannite is gathered in Sicily and Catalonia for the purpose of obtaining sugar. In July or August the collectors make deep cuts through the bark to the wood near the base of the tree; and if the weather be warm and favourable, the manna begins to ooze out of the cuts slowly, and bandies in lumps or flakes, which are found in the time removed by the collectors. Manna is a light porous substance, usually in stalactiform pieces, 1 to 6 inches long, crystalline, friable, yellowish in colour, with a honey-like odour and a sweetish, somewhat bitter taste. It is used in medicine as a gentle purgative for young children. It consists of about 60 to 90 per cent. of mannite, about 10 per cent. moisture, a bitter substance, and other less important constituents. There are several other manna-yielding plants besides the ash, especially the sycamore (Aesculus hippocastanum), the small-leaved maple (Acer negundo), and Eucalyptus manifera, which is non-purgative, and is a favourite sweetmeat with the children of that country. Small quantities are found on the common larch in some districts; this kind is known under the name of manna of Briançon.

The manna which they ate during their wanderings in the wilderness was identified by Ehrenberg with the saccharine substance called Mount Sinai Manna, which is produced in that region by a shrub, Tamarix mannifera (L.), from the branches of which it falls to the ground. It does not, however, contain any mannite, but consists wholly of mucilaginous sugar. The exudation when concretes into this manna is caused by the punctures made in the leaves by insects. Manna is (C. manifera), which sometimes cover the branches. It is a kind of reddish syrup, and is eaten by the Arabs and by the monks of Mount Sinai like honey with their bread. Others have supposed that the manna of the Jews was produced by the bark of Canum's Thorn (q.v.).

Manners, a noble family of Northumbrian extraction, whose ancestor, Henry de Manners, having in 1178 been lord of the manor of Ethale, or Etal, in that county. His descendant, Sir Robert de Manners, was governor of Norham Castle in 1327. In 1454 another Sir Robert de Manners purchased the manor of LipILTERTON (q.v.). In 1656 his grandson was raised to the earldom of Rutland; and in 1703 the tenth earl was raised to the dukedom. The eldest son of the third duke was the celebrated Marquis of Granby (q.v.). The chief seat of the family is Belvoir Castle, 7 miles W. of Grantham, a large castellated pile, reconstructed by Wyatt, and commanding a splendid view. Crabbe was chaplain here. See works by Eller (1841) and Allen (1874).

Mannheim, the capital formerly of the Rhenish Palatinate, and now the chief trading-town in Baden, lies low in a fertile plain on the right bank of the Rhine. In the 18th century it was the seat of the Bishop of the Neckar, 53 miles S. of Frankfort and 38 N. of Carlstein. The fortifications have been converted into gardens, and the town is remarkable for its cleanliness and regularity, the whole of it being laid out in quadrangular blocks. The palace, built in 1720-29 by the Elector Palatine Charles Philip, is one of the largest in Germany, covering 15 acres, with a façade 560 yards long, and 1500 windows. The Schillerplatz is adorned with colossal statues of Schiller, Dalberg, and the actor and dramatist IlIland (1758-1814). A great and increasing river-trade is carried on, the harbour having been opened in 1875. The manufactures also are important, of iron, brass, copper, and leather, &c. Pop. (1875) 46,433; (1885) 61,237 (26,904 Catholics, 4249 Jews); (1890) 79,658. Mannheim is heard of as early as 766, but remained a mere village till 1606, when a castle was built on the Rhine, around which a town grew up, peopled chiefly by Protestant refugees from the Low Countries. It was several times taken and retaken during the wars of the 17th century, totally destroyed by the French in 1688, restored in 1713, and in 1739 severely bombarded by the Austrians. See works by Fecht (1864) and Feder (1873-77).

Manning, Henry Edward, a cardinal of the Catholic Church, was born 15th July 1805, at Totteridge in Hertfordshire, was educated at Harrow and Balliol College, Oxford, and, after taking a double first in 1828, was made a Fellow of Merton. He soon came to the front as a great preacher and as a leader of the Tractarian party. In 1834 he was appointed to a country rectory in Sussex, and married a lady whose sisters were the wives of Samuel and Henry Wilberforce. Mrs Manning died after a few months of married life. In 1840 her husband became Archdeacon of Chichester. But in 1851, deeply moved by the final decision in the ‘Gorham Case’ (q.v.), he left the Church of England and joined the Church of Rome. His advancement to that communion was rapid from the first; having been consecrated priest in November 1851, he was ordained in Rome, and in 1857 he founded the congregation of the Oblates of St Charles Borromeo at Bayswater, London. He was made provincial of Westminster, and in 1865, on the death of Cardinal Wiseman, was promoted to be Archbishop of Westminster. At the Ecumenical Council of
1870, Manning was one of the most zealous supporters and promoters of the infallibility dogma; and his influence in England was considerable. He was the influential leader of the Ultramontane section of the church. Besides being the foremost spirit in most Catholic movements in England, he took part in many non-sectarian good works designed to better the social life of the people, such as the temperance movement; and he was a member of the Royal Commissions on the Housing of the Poor (1885) and on Education (1886). Before his consecration to Rome, he published several volumes of powerful sermons; his subsequent writings were mainly polemical. He revised a number of articles in the Catholic Encyclopedia. A devout and zealous man, he was a man of superior intellect, and a practical reformer, he died 14th January, 1892. The Life by E. S. Purcell (2 vols. 1896) was considered hardly fair to his memory, and provoked controversy. A short Life by A. W. Hutton appeared in 1892. Manning wrote on infallibility, the Vincentian Council, Ultramontanism, the Four Great Divisions of the Day (2 ed. 1871), Internal Mission of the Holy Ghost (1875), The Catholic Church and Modern Society (1880), Eternal Priesthood (1883), Characteristics (ed. by W. S. Lilly, 1885), &c.

Manning, Robert. See Brune [Robert of].

Mannite, C¹H₅(OH)₂ is a peculiar saccharine manna which is the principal constituent of Manna (q.v.); it is also found in several kinds of fungi, as asparagus, celery, onions, &c. It is most readily obtained by digesting manna in hot alcohol.

Manor. See El Dorado.

Man-of-war. See Navy.

Man-of-war Bird. See Frigate Bird.

Manometre (Gr. manou, 'thin,' 'rare') is properly an instrument for measuring the density of the air or of other gases; but the name is most frequently applied to instruments for indicating the elastic pressure of gases, which is always, for each kind of gas, inversely proportional to its density.

Manor, in English law, denotes the land held by a body of tenants under one seignior or lordship. It is probably the gradual establishment of feudal rights over parts of manors or serfs; but, according to legal theory, the lord derives his rights from the king or from some superior lord. In a fully-organized manor the local customs are enforced by three courts: a Court Baron for the free tenants, who are enfranchised the barons or men of the manor; a Customary Court for the copyholders, who hold by base or customary tenure; and a Court Leet, in which officers are elected and minor offences punished. The lord's demesne includes lands occupied by himself and by his tenants-at-will, including customary tenants. Freehold lands do not form part of the lord's demesne; but free tenants are essential to the existence of a manor. Where the services of free tenants have been levied to procure the £1000 for the desecrated, the manor survives as a 'manor by reputation,' but the Customary Court is kept alive for the purpose of recording acts and events which affect the title to copyhold lands, and of collecting the quitrents, fines, &c., which are payable to the lord. No new free tenants can be created in England since the statute Quia Emptores, passed in 1290; all existing manors, therefore, must trace their origin from before that time. The king himself was lord of many manors in right of his crown; and these are called manors of ancient demesne, to distinguish them from lands which fell causally into the king's hands by forfeiture or otherwise. Manors closely resemble the feudal estates known to the law of Scotland. In the United States there is no institution corresponding to the English manor.

Manrent (or properly, Manreed), Bonds of, agreements which used to be entered into in the Highlands of Scotland between the greater and lesser magnates, where protection on the one hand was stipulated in return for allegiance on the other.

Manresa, a town of Spain, on the Cardoner, 4 miles by road N.W. of Barcelona. It has a fine church (1020–15th century), the cave of Ignatius Loyola, and manufactures of cotton, broadcloths, brandy, &c. In 1811 it was fired by Marshal MacDonald—an outrage avenged by the Catalan knives of the townsfolk. Pop. 16,326.

Mans, Le, a picturesque city of France, the capital formerly of the province of Maine, and now of the department of Sarthe, on the left bank of the river Sarthe, 132 miles SW. of Paris by rail. The cathedral, 380 feet long, has a Romanesque nave of the 11th and 12th centuries, and a magnificent choir of the 12th century, 104 feet high, with splendid stained glass. In the transept is the monument of Berengaria, Count-de-Lion's queen. There are two other interesting churches, and both préfecture and seminary occupy old conventual buildings, the former comprising also a library of 55,000 volumes. Le Mans does a large trade in poultry and clover-seed, and manufactures candles, woolens, lace, soap, &c. Pop. (1872) 42,654; (1891) 57,412. The Consommé of the Romans, and the birthplace of Henry II. of England, Le Mans witnessed in 1783 the dispersion and massacre of more than 10,000 Vendéens; and in January 1871 the defeat, after a stubborn resistance, of 100,000 Frenchmen under Chanzy by Prince Frederick-Charles. A statue of Chanzy was erected in 1883, and one of Belon (q.v.) in 1887. See Hulin, Le Mans Pittorique (1885).

Mansard Roof, a form of roof invented by François Mansart (1598–1666), a distinguished French architect. It is constructed with a break in the slope of the roof, so that each side has two planes, the lower being steeper than the upper. The framework ought to be arranged so that its parts are in equilibration. This kind of roof has the advantage over the common form of giving more space in the roof for living-rooms.

Manse, in Scotch law, is the designation of a dwelling-house of the minister of the Established Church, and in popular use the term is often applied generally to the dwelling-house of any minister of a dissenting congregation, though no legal right exists in the latter case. In the Established Church every first minister of a rural parish is entitled to a manse, which the heritors or landed proprietors in the parish are bound to build and uphold; and he is also entitled, as part of the manse or dwelling-house, to a stable, barn, and byre. The manse must, by statute, be near to the church. When a manse has been built or repaired by the heritors it becomes a free manse, and all ordinary repairs have to be done at the charges of the minister. The effect of a manse is that 'free' may be given by the sheriff; and such decree stands good for fifteen years, or until the appointment of a new minister. It has been judicially decided that a minister has a right to let his manse at a rent for two months in summer.

Mansel, Henry Longueville, Dean of St Paul's, was born at Cogrovec rectory, Northamp-
MANSFIELD

townshire, October 6, 1820. Educated at Merchant
taylors' School and St John's College, Oxford, he
became Reader in Modern History in 1823, and
Professor in 1833, and Waynflete professor in
1859. Appointed regius professor of Ecclesiastical
History, and canon of Christ Church, Oxford, in
1867, he was made Dean of St Paul's
in 1889. He died 31st July 1871. The pupil and
successor of Hamilton (q.v.), he differed from him
in holding that there is immediate cogni-
tion of the conscious ego; and he went beyond
his master in emphasising the relative importance of
knowledge in the province of theology—alleging that we
have no positive conception of the attributes of God
(supernatural knowledge) without a signification of this
doctrine created violent controversy. His pub-
lished works are Aldrich's Logic, with Notes
(1849); Prolegomena Logica (1851); article "Metaph-
ysics" in 8th edition of the Encyclopaedia Brit-
annica (1857), afterwards published separately;
"The Limits of BELIEF" (1858); "The Philosophy of the Conditioned"
(1866), in reply to Mill's "Review of Hamilton's
Philosophy"; and lectures on The Ionic Heroes,
edited by Lightfoot in 1874, with Life of Mansby
by the same author. He was a fellow, and Professor Veitch, of Sir William Hamilton's Le-
tures. See Dean Burgon's Lives of Twelve Good
Men (1888).

Mansfield, COUNTS of, an old German noble
family (founded circa 1000), whose ancestral castle
stood on the mound of the Hart Mountains, 14
miles NW. of Halle. Two members of the family
have acquired historical reputation. COUNT Peter ERNST I., afterwards elevated to the rank of a
prince, was born on 15th July 1517. Having taken
part in Charles V.'s expedition against Tunis, and
classified afterwards as the ablest German statesman,
he was made by the emperor governor of the
duchy of Luxembourg. But in 1532, whilst
rading in Champagne, he was taken prisoner by the
French, and not ransomed until 1557. He
fought against them again at St Quentin. On the
outbreak of the revolts in the Low Countries he
made a name as one of the cleverest generals in the
Spanish service. Having been sent by Alva to the
assistance of the French king against the Pro-
testants, he covered himself with glory at Mon-
cenier, in which battle he took prisoners in many
magnificent and military operations in the Nether-
lands, and acted for a while as governor of the
Spanish Low Countries. In 1597 he retired to
Luxemburg, where he had gathered a valuable
collection of antique art, and died there on 22d
May 1604.

His illegitimate son, Peter ERNST II., usually
called Count Ernest von Mansfield, was one of the
most prominent military leaders during the
Thirty Years' War (q.v.). Born at Luxemburg in
1597, he served his apprenticeship to war in the
Austrian service in Hungary and in the Julian
dispute. As part of his reward he was promised
his father's possessions; but when it came to the
pincel, they were refused to him. This
converted Mansfield into an implacable enemy, and
he devoted himself to the defense of Saxony,
against many sieges and military operations in the Neth-
lands, and acted for a while as governor of the
Spanish Low Countries. In 1597 he retired to
Luxemburg, where he had gathered a valuable
collection of antique art, and died there on 22d
May 1604.

MANSION HOUSE

20th March 1793, when the title devolved upon his nephew, Viscount Stormont.

Mansion House, the official residence of the Lord Mayor of London, was built on the site of the Old Stocks Market in 1739, at a cost of £42,638. It is an oblong building, and at its farthest end is the Egyptian Picture Gallery, one of the most attractive features of this grand banqueting room, which was designed by the Earl of Burlington from the description of an Egyptian chamber given by Vitruvius. All the great banquets, public and private, given by the Lord Mayor take place here, and there are also fine state rooms. The result of the exhibition of 1851 the Corporation of London voted £10,000 to be expended on statuary for the adornment of the Mansion House; and there is also a fine gallery of portraits and other pictures. Among its curiosities may be mentioned a state bed, which cost 3,000 guineas, and a kitchen and culinary utensils extraordinary for their vast size. The Lord Mayor's jewelled collar of gold and diamonds, his silver-gilt mace, his sword, and his seal are described, together with his coach and chair of state, in Thornbury's Old and New London, vol. I, pp. 436, 443. The establishment and expenses connected with the office cost an annual sum of £25,000; and it is said that only one Lord Mayor ever saved anything out of his salary. The Mansion House is too modern to possess much historical interest; but the Wisties riot frequently took place in its neighbourhood during the mayoralty of Wilkes's friend, Brass Crosby. The Mansion House is often a centre of benevolent enterprise in the collection of money for sufferers by war, famine, flood, pestilence, and earthquake; and his expenditures, if any, for lack of employment at home; and Mansion House Funds are also raised for memorials to heroic worth.

Manslaughter is the crime of unlawful homicide without malice aforethought. Homicide, or the infliction of death, is not a crime when it is done in self-defence against unlawful violence, or when it is done in the exequation of the sentence of a court of justice. Thus one whose life is endangered by the violent attack of a madman, and kills the madman, commits homicide, but is innocent of manslaughter. So, too, is the executioner, who hangs a convicted criminal. Homicide is unlawful, and amounts to manslaughter when, without being justified in any such manner as has been exemplified above, it is committed with the intention to cause physical injury; or is the result of culpable negligence or omission to perform some legal duty; or is the result of an accidental occasioned by some unlawful act. Thus, if one man strike another without intending to kill him, and the blow prove fatal, the striker is guilty of manslaughter; or if, where it is the duty of the master of a ship to keep a lookout for small boats in the ship's way, a boat is run down and its occupants drowned in consequence of the absence of a look-out upon the ship, the master of the vessel is guilty of manslaughter; or if a man is engaged in an unlicensed manufacture of dynamite, and by an accidental explosion of the dynamite another is killed, the manufacturer is guilty of manslaughter. When manslaughter is accompanied by malice aforethought, it becomes murder. See Sir James Stephen's Digest of the Criminal Law.

Manson, GEORGE, a Scottish water-colour painter, born in Edinburgh, June 16th, 1798, and died in December 1850. He served five years as a wood-engraver in the establishment of Messrs. W. & R. Chambers, studying art in his spare hours morning and evening. His first picture which attracted attention, 'Milking Time,' was painted at Craigmillar Castle near Edinburgh, between four and eight o'clock of the mornings of a whole summer. In 1871 he devoted himself to painting altogether, but his youthful hard study had permanently injured his health, and he died at Lampstone, Devonshire, 27th February 1876. His pictures, which have increased largely in value since his death, are mostly from humble life; beauty and refinement of drawing and colour are their great charm. A memoir of him, with photographs of his principal pictures, was published in 1880. See also P. G. Hamerton's Graphic Arts, p. 311.

Mansourah, a town of Lower Egypt, on the Danubiana branch of the Nile, 30 miles SW. of Damietta by rail. Pop. (1897) 34,997. The place was founded in 1290, and here St Louis of France was imprisoned in 1270.

Mant, RICHARD (1776-1848), divine, was born in Southampton, educated at Oxford, and after holding curates in England, became successively Bishop of Killaloe (1820) and of Down and Connor (1828), with Dromore attached (1842). He wrote with D'Oyly a famous annotated Bible (1814), an annotated Old Testament (1830), and wrote a History of the Church of Ireland (1841). See his Memoirs by Berens (1849) and W. Mant (1857).

Mantegnza. See MANCHURIA.

Mantegna, ANDREA, Italian painter, born in or near Padua in 1431, was the favourite pupil and adopted son of that tailor Maccensi of painters, Scuareonze. By studying the antique collections gathered by his patron, especially from the study of the sculpture, Mantegna became imbued with the spirit of ancient art, and all his works bear the impress of the severe dignity and precision of his models. Grace and beauty were not the ideal truths that he aimed at; some of his pictures are positively ugly. A precocious genius, Mantegna set up an independent atelier when only seventeen years of age. Amongst his earliest works, done at Padua, are frescoes of saints in the church of St Anthony, an altarpiece for St Justina, and most of the frescoes of St Christopher, and some of those of St James, in the church of the Hermits. Having married the sister of Giovanni and Gentile Bellini, he seems to have become estranged from Scuareonze, and left Padua (1459). He painted an altarpiece, the 'Madonna and Angels,' for St Zeno's church, and was called to Rome. Induced by Lodovico Gonzaga, Duke of Mantua, to settle in his city. There he remained, with the exception of a visit to Rome (1485-90) to paint a series of frescoes (now destroyed) for Pope Innocent VIII., until his death on 15th September 1516. His greatest works at Mantua were nine tempera pictures representing the 'Triumph of Caesar' (his master-piece), 'The Madonna of Victory with Gonzaga,' 'Par ASSUS,' 'Defeat of the Vices,' 'Triumph of Scipio,' and 'Madonna between St John the Baptist and St Magdalene.' Like Leonardo da Vinci, Mantegna was something of a universal genius. He was an engraver and an architect, as well as a painter, and is said to have written poems and wielded the sculptor's chisel. He introduced into North Italy, though he can hardly have invented the art of engraving with the burin on copper. His best plates bear the titles 'A Bacchial Feast,' 'Descent from the Cross,' 'Entombment,' 'Resurrection,' 'Battle of the Titans,' and 'Roman Triumphs. Mantegna's technical excellencies have influenced forms of study, perspective, and austerity of form exercised a great influence upon subsequent Italian art.

Mantell, GIDEON ALGERNON, an eminent British paleontologist and geologist, was born at Lewes, in Sussex, in 1796; studied medicine, and practised successively at Lewes, Brighton, and
MANTUA
Notre
Mantua
MANTES
Mantua, a town in the French department of Seine-et-Oise, on the left bank of the Seine, 36 miles by rail NW. of Paris. It has a striking tower (1344) and a beautiful church, a reduced copy of Notre Dame at Paris. The ancient Mediana, a town of the Celts, was, in 1683, nearly sacked by William the Conqueror, who here received the injury that caused his death; and here too Henry IV. was converted from Protestantism. Pqg. 6097.

Mantegna, EDWIN HANS KARL, FREIHERR vON, an Austrian general and administrator, was born of an old Pomeranian noble family at Dresden on 24th February 1809. Entering the Prussian guards in 1827, he rose to be colonel by 1834, and three years later was nominated head of the military school at Berlin, a post which he held until 1860. Having been appointed commander of the Prussian troops in Silesia, he protested against the summoning of the Holstein estates by marching his men into that duchy (June 7, 1860). On the outbreak of hostilities Mantueffel commanded a division of the army of the Main, which was destined to act against the south German allies of Austria. He took part in the battle of Langensalza (27th June), which brought about the capitulation of the Hanoverian army, and on 19th July succeeded von Fallekenstein as commander-in-chief of the Austrian forces, and by winning the battles of Werbach, Taunusbischofheim, Kehlstatt, and Rossbrunn over the Bavarians and others he brought that part of the campaign to a successful issue. He entered the war of 1870 as commander of the First Corps, but was soon promoted to the command of the First army, which fought successfully at Amiens and other places. Transferred in January 1871 to the command of the army of the south, operating against Bourlaki, Mantueffel assailed the enemy’s rear near Belfort, and drove 80,000 men across the frontier into Switzerland. When peace was proclaimed he was placed in the head of the army of occupation in France, and in 1879 was appointed imperial vicerey of the newly-organised provinces, Alsace-Lorraine. His administration was not a happy one; his endeavours to help on the process of Germanisation by direct efforts only increased the clergy and upper classes, both French and German. He died at Carlshad, 17th June 1883. See Life by Keck (Kielief. 1889).

Mantinca, an ancient city of Arcadia, in the Peloponnesus, situated on the river Ophiis, in the midst of a level plain. Here Epaminondas fell in the moment of a great victory over the Spartans, 362 B.C.

Mantis. This name is commonly applied to the various genera which constitute the family Mantidae of the Insect order Orthoptera. They are chiefly to be distinguished by the long prothorax and the enlarged front legs, which are fitted for grasping. They are entirely carnivorous in habit, but do not actively pursue their prey; the insect waits patiently until a fly comes within reach, and then rapidly seizes it with its fore-limbs (see the illustration).

The attitude adopted while waiting for insects to come within reach has given to one species, plentiful in the south of Europe, the name of "praying mantis" (M. religiosa). This creature, invested with supernatural attributes, figures prominently in Bushman mythology and folklore. One of the most remarkable forms of mantis is the Indian Hymenopus coronatus; it has a flower-like shape and a pink colour. The apparent petals are the much-flattened joints of some of the limbs as it rests quietly among foliage. It is supposed that the resemblance to an orchid-like flower may delude smaller insects into approaching near enough for the mantis to take advantage of its "alluring" colours and shape.

Mantling. See IERALDY.

Man-traps, engines for the terrifying of trespassers and poachers (formerly often indicated by the warning notice 'man-traps and spring-guns set here'), resembled gigantic rat-traps with the teeth sharpened. They may be seen in museums; it is, since 1827, illegal to set them save indoors between sunset and sunrise, as a defence against burglars.

Mantua (Ital. Mantova), a fortified city of Northern Italy, formerly capital of the duchy of the same name. 38 miles by rail N. of Modena and 25 S. by W. of Verona, occupies two islands formed by the Mincio, and stands in the midst of a marshy district, which, combined with its artificial fortifications, make it perhaps the strongest fortress in Italy. But at the same time its situation makes it liable to malaria. It forms one of the four fortresses of the Quadrilateral (q.v.). The streets are spacious, the squares numerous, and the population comparatively small, 28,048 in 1881; so that for this reason, and because of the numerous massive medieval buildings, the town has a lifeless and gloomy appearance. Chief amongst the buildings are the fortress of the Gonzaga, erected in 1393-1406, and adorned with paintings by Mantegna; close by is the ducal palace, begun in 1302, which contains 500 rooms, many of them ornamented with paintings and designs of Giulio Romano; the Palazzo Te, outside the city walls on the south, the greatest monument to the skill of Giulio Romano as architect, painter, and sculptor; the cathedral of San Pietro, restored from designs by G. Romano; and the church of San Andrea, one of the finest Renaissance churches in Italy, containing the tomb of Mantegna, whose pupils
adorned the walls with frescoes. The public institutions include an academy of arts and sciences, a library with 80,000 vols. and 1000 MSS., a museum of antiquities, an observatory, archives, a botanical garden, a large military hospital, &c. Virgil was born at Pietro (anc. Andes), now a suburb of Mantua. The industries include weaving, tanning, and iron. There are many churches, especially the Cathedral of Mantua. Mantua, an Etruscan town, was successively in the possession of the Romans, Ostrogoths, and Lombards before falling into the hands of the emperors, who gave it to the Marquis of Canossa. For this right it was called the County of Mantua. It was taken by the Turks in 1524. After her death it was a free imperial city and joined the Lombard leagues against the Hohenstaufen emperors. The Bronacolisi made themselves masters of the city in 1247, but were ousted from power by the head of the Gonzaga (q.v.) family in 1252. This dynasty, the head of which was created duke by Charles V. in 1530, not only maintained themselves against their great rivals, the Visconti of Milan, but raised the city to the height of its splendour and renown. The last duke died childless in 1708, and his duchy was confirmed by the Three States of the League of Four Nations in 1786, except for two short periods (1797–99 and 1801–14), when it was in the possession of France. Mantua has endured at least three great sieges, by the Emperor Ferdinand II. in 1630, by the French in 1797, and by the Austrians in 1799. During the years 1798–1814 the head of a minor branch of the Mantuan house was kept in power by the political persecution by the Austrian government. See Arcò’s History, in Italian (7 vols. 1871–74). The province has an area of 911 sq. m., and a pop. (1859) of 321,572.

Mann (from the Sanskrit man, ‘to think,’ lit. ‘head,’ ‘understand’) is the most renowned law-book of the ancient Hindus, and likewise of an ancient Kalpa work on Vedic rites. It is matter, however, of considerable doubt whether both works belong to the same individual, and whether the name Mann, especially in the case of the author of the law-book, was intended to designate an historical personage; for, in several passages of the Vedas (q.v.), as well as the Mahabharata (q.v.), Mann is mentioned as the progenitor of the human race; and, in the first chapter of the law-book ascribed to him, he declares himself to have been created by the Supreme Being, and to have created all this universe. Hindu mythology knows, moreover, a succession of Mannus, each of whom created, in his own period, the world anew after it had perished at the end of a previous age. (10) Mann—chief to our ‘man’—belongs therefore, properly speaking, to ancient Hindu mythology, and it was connected with the renamed law-book in order to impart to the latter the sanctity on which its authority rests. This work is not merely a law-book in the European sense of the word; it is likewise a system of cosmogony; it propounds metaphysical doctrines which teach the art of government, and, amongst other things, treaties of the state after the soul of death. The chief topics of its twelve books are the following: (1) creation; (2) education and the duties of a king; (3) the duties of a householder, or the second order; (4) the duties of a woman; (5) diet, purification, and the duties of a freeborn; (6) the duties of an anchorite and an ascetic, or the duties of a poor man’s life; (7) the duties of a warrior and the duties of a king and the military caste; (8) indigence and law, and private and criminal; (9) continuation of the former and the duties of the commercial and servile castes; (10) mixed castes and the duties of the castes in time of distress; (11) penance and expiation; (12) transmigration and final beatitude. Bühler has proved that Max Müller was right in regarding the extant work as a versified record of an ancient law-book, the munual of a particular Vedic school, the Manasva; and holds that the work, the date of which used to be given at 1200 B.C., was certainly extant in the 2d century A.D., and seems to have been composed between that date and the 2d century B.C. There are many correspondences between the extant work and the Mahabhárata, suggesting the use in both of common materials.

The laws of Manu were translated by Sir William Jones (1794). See also The Ordinances of Manu, translated from the Sanskrit and Englished by Edward Hasler (1758), completed by Hopkins (1886); The Laws of Manu, translated with extracts from seven commentaries by G. Bühler (in ‘Sacred Books of the East,’ 1888).

Manure. Any material, whether of animal, vegetable, or mineral origin, which adds to the fertility of the soil has been generally regarded as manure. The applications of vegetable and farmyard manure, as also the ashes of plants, &c., to the soil has been practised probably in all ages; but the scientific principles involved in this ancient practice were but little understood until more recent times, when chemists, botanists, and physiologists set sciences as a means of ascertaining the characteristics of external manures, and thereby the changes which are ever taking place in the soil and in the plant itself. On virgin soils crops may be grown for years without much evident diminution in quantity or quality; but a period must come when the enrichments become insufficient, and then becomes necessary to add to the soil in the form of manure such constituents as the crops have removed in order that the land may regain fertility. When we consider that Soils (q.v.) are formed mainly from the weathering of rocks, it will at once be understood how important it is that we know what substances manures should contain such things as magnesia, iron, alumina, &c. Speaking generally, the constituent which removes by plants from soils, the loss of which brings about that condition of the same is the organic matter, or the food, or the matter resulting from that change. Farmers chiefly advantage derived from the use of fish manure are that it makes the soil porous, and that the conditions which result from the decomposition of the organic matter are favourable to the development of those micro-organisms which bacteriologists are endeavouring to prove are as much importance as the manure itself (see Nitrification). Manures containing large proportions of organic matter, such as stable manure, wrack or seaweed, fish offal, &c., have value as plant-food; but the heat developed during their decomposition, or rotting, and the fact that the soil is made acid resulting from that change acts as a solvent on the mineral constituents of the soil and otherwise, are of still greater moment.

The first artificial manure systematically used was probably bones, applied in the earlier periods, either in an unground condition or simply burnt. About the beginning of the 19th century, however, it was proved that fineness of division rendered bone more easily assimilated by plants; and further progress was made when Liebig introduced the treatment of bones, first, with sulphurous acid, whereby chemical division was realised. There are about 50,000 tons of bone imported into Britain annually,
while of home-collected bone not less than 60,000 tons are annually made in the manufacture of manure, and of this latter quantity London alone produces fully 23,000 tons annually.

**Guano.**—Peruvian guano was at one time imported from the Chincua Islands in enormous quantities; but the old deposit is practically exhausted, and the quantity of the mine available supply is comparatively poor (see **Guano**). Ihlaloboe (off south-west Africa) guano is still imported, though in somewhat limited quantity; but it is much the richest available guano. The value of these guanos lies not only in their nitrogenous matter, ammonia salts, phosphates of the alkalies and of lime, and the potash salts which they contain. Some of the islands in the South Pacific yield supplies of guano, but these are almost purely phosphoric, owing to the abundant rainfall of that region having washed out all the ammoniacal salts. Liebig's Guano and Liebig's Meat Meal are by-products from the preparation of Liebig's extract of meat. They are in a fine state of mechanical division, and are valuable sources of nitrogen and phosphates. Fish-guano is made from fish meal, the more usually from Scotland from fish offal (see **Guano**). The process employed is essentially steaming to remove the oil, which is run off with the water; the solid residue is pressed and dried. The manurial constituents of fish-guano are phosphoric and nitrogenous.

**Dried Blood** is another valuable source of nitrogen. Horn powder, shoddy and wool waste, leather reslings, &c. are also employed for the same purpose, but they are of much less value.

**Phosphoric Substances.**—The coprolites of Cambodia, Norfolk, and Suffolk come under this classification, as does also the land phosphate from the Ashley Basin of South Carolina, and the dredged phosphate from the Ashley and Cooper rivers. In addition to these we have Canadian apatite, Sombrero, Navassa, Sonomie, Belgian, Florida, Spanish, Curacao, and numerous other phosphates. These are of little value as manure in their natural and ground state, and are almost wholly converted into superphosphate by the action of sulphuric acid, whereby the natural or tricalcic phosphates—of which phosphoric acid is converted into the monoatomic phosphate, which is soluble, and therefore readily available to plants.

**Sulphate of Ammonium** is principally derived from the destructive distillation of coal and shale (see **Gas-lighting** Vol. V. p. 98, and **Paraffin**). Its very valuable properties as a manure are due to the nitrogenous acid, which it contains. This salt sometimes contains sulphocyanide of ammonium, a substance which is indolent to plant-life. Some experimentalists assert with all confidence that ammonium salts must undergo nitration before they can enter the plant; but that contention is scarcely now tenable, because nitration is possible in some cases within the plant itself.

**Nitrate of Soda or Chile Saltpetre** is very extensively imported, and is sold on a basis of 93 per cent. cent. percentage—i.e., and more than 5 per cent. of impurities. It is found native in several districts of South America in an impure state, and is rendered marketable by a process of solution and re-crystallising. Its action as a manure is as follows: ammonia, nitrate of lime, nitrate of potash, or sulphate of ammonia. Its only valuable constituent is nitric acid, while in the other nitrates mentioned the base is also serviceable.

**Kalk.**—Soils are of the utmost service to plants. Cereal or clay lands generally contain a sufficiency of potash, while medium and light soils require it to be added. Nitrate, sulphate, and muriate are all more or less employed in compounding potash

Manures (i.e. manures containing potash as one of their constituents), but kainite—an impure potash salt largely imported from Germany—is perhaps the most generally used when a dressing of potash only is desired.

**Liquid Manure** may be classified with farmyard manures, and is now very commonly absorbed in the courts by the straw, &c. Occasionally it is used in the liquid form on grass or stubble land.

**Lime** is one of the most necessary constituents of soils and manures. It is generally applied 'fresh burned' to newly-broken land, or where there is much destruction of the organic compounds, and is also used in the elaboration of organic acids. Lime is the great carrier into plants of other 'stuffs' which go to form their organic compounds, and during this elaboration organic acids are formed, many, if not all, of which would poison the plants themselves but for the presence of lime, with which these organic acids combine to form insoluble non-poisonous compounds.

The study of the subject—manures and manuring—can be most profitably followed in the works of Lawes and Gilbert. Yet most of our manurial—or agricultural—experiments are but gropings in the dark, and little or no attention is paid to the most healthy and conducive, namely because the experimentalists have known little or nothing of the changes going on in the plant itself, or of the variations in those changes caused by the amount and intensity of light and heat. Until we know the life-history of the microscopic organisms in the soil, their life-history and functions, but little progress can be made; and until we have experimentalists capable of demonstrating the functions, chemical and physical, of plants, and the variations in those functions with the ever-varying climatic conditions, so-called agricultural research must lead to disappointment. See **Agriculture**, **Composts**, **Rotation**, and **Sewage**.

**Manyplis.** See **Digestion**.

**Manzaniello.** (1) a fine port of Mexico, on the Pacific coast, 31 miles by rail WSW, of Colima. It exports agricultural products and silver ore. The surrounding country is fertile, but unhealthy. Pop. about 2000. (2) A port on the south coast of Cuba, 4 miles N. of a fertile and unhealthy locality, 37 miles W. of Havana. It has good harbours and sandstone, yam tobacco, and lumber. Pop. (1889) 14,464.

**Manzoni, Alessandro,** a great Italian writer, was born at Milan, March 7, 1785, of noble parents, and through his mother grandson of the celebrated Marquis Becaria. He published his first poems in 1808, married happily in 1810, and spent the next few years in the composition of the *Ivanhoe*, sacred lyrics, and a treatise on the religious basis of morality, by way of preparation for the unfettered of early youth. In 1819 he published his first tragedy, *Il Conte di Carmagnola*, a trumpet-blast of romanticism; the second, *Achelé*, followed in 1822. Manzoni's first tragedy had the honour to be defended by Goethe, ‘one genius having divined the other.’ Thit the work which gave Manzoni European fame is his historical novel, *I Promessi Sposi*, a Milanese romance of the 17th century (3 vols. Milan, 1825—6). The tale abounds with notable episodes of national and local Italian customs and modes of life, portrayed with unfailing spirit and humour, while various grave historical events are narrated with force and grandeur of style, especially the massacre by the League in Milan. Manzoni's noble ode, *Il Cinque Maggio*, was inspired by the death of the great Napoleon. His last years were darkened by the frequent shadow of death within his
MAORIS

household. He himself died at Milan, 23d May 1873, leaving to posterity the memory not alone of a great writer, but of a singularly noble and sincere man.

A complete edition of his works, in 5 vols., was published by Niccolò Tommasino (Florence, 1828–29). His Letters to Storza (1873) and a finished work on the French and Italian revolutions of 1789 and 1839 was edited by Bonghi (Milan, 1889). Biscarini's Bibliografia Manzoniana (Turin, 1875) will be found useful. His works are listed in Biographical Cyclopedia (1872); Bersezio (1873); Prina (1874), and Pugni (1876).

Maoris, the native inhabitants of New Zealand (q.v.).

Maormor. See Earl.

Map (Lat. mappa, 'a towel'). A map is a delineation on a plane of the surface of the earth or of a portion thereof, exhibiting the lines of latitude and longitude, &c., and the forms and relative positions of the countries, mountain-ranges, rivers, towns, &c.; or it may be of the starry heavens, or of stars and constellations. As it is manifestly impossible correctly to represent a spherical upon a plane surface, geographers are consequently necessitated to resign to us a scale in order to minimise or distribute the unavoidable distortion and disproportion. Hence the use of the various map projections or arrangements of the lines of latitude and longitude. The only true representation of the earth's surface, it is clear, is to be found on the terrestrial globe; but for convenience in form and necessarily too small in scale to serve the purposes effect the map proper, which are usually produced on paper or other convenient plane surfaces, and a series of which, combined, form an atlas. A hydrographical map, especially representing oceans, seas, or navigable waters with their coasts, sandbanks, currents, lighthouses, depths, and other objects and information of importance to seamen, is usually constructed on Mercator's projection, and is called a Chart (q.v.). A special topographical map represents the details minutely and on a considerable scale. The Ordnance Survey of Great Britain and Ireland is a good example of such, and is produced on various scales—viz. 6 inches and 1 mile respectively. Some counties are also published on a scale of 1 square inch to an actual mile. Similar maps of the rest of the British Empire, or exact trigonometrical work, are extant of the continent of Europe from the Bay of Biscay to the Lower Volga, and from Sicily to St Petersburg. Portugal also is thus represented, and considerable parts of Sweden and Norway, but not of Turkey or Greece, and but little of Spain. Similarly advantaged are the considerable portions of the United States, Algeria, the Nile Delta, Sinai, Palestine, India, Ceylon, and Java. The results of general but not detailed surveys exist of the remaining portions of Europe, United States, Canada, Argentina, Cape Colony, eastern and southern Australasia, New Zealand, Japan, China proper, and parts of central Asia, Persia, and Asia Minor. Much of the chro- nography of the rest of the known world is compiled from numerous observations and itineraries, and is fairly reliable. The line marked on a map is called a great circle line, and a straight line is a great circle divided by a great circle dividing the earth in two equal parts. In the case of a map of the world, the central parts of the hemisphere are fairly accurately represented, the parts towards the circumference are crowded together and diminished in size. On this account it is of little use for geographical purposes, but most suitable for maps of the moon. (2) In the stereographic the eye of projection is supposed to be placed on

---

MAP

The lines of projection on a map are essential for determining the positions of the parts, and indicate latitude, or distance north or south from the equator, and longitude, or distance east or west from any given line. These lines are called meridians, and are usually numbered from the meridian of Greenwich on English maps, and indeed on nearly all maps. Other first meridians in common use are those of Paris, Washington, and Ferro (see LATITUDE AND LONGITUDE). These distances are given in degrees, minutes, and seconds, or in other circle measurements. In choosing a projection, regard must be had to the purpose for which it is intended, and to the area to be represented. The effects inherent in a projection nearly imperceptible in a map of England might be fatal to its use in Asia. Of all the known projections, the Mercator is one of the most easily comprehended. In the Mercator the world is shown in the form of a cylinder with its base divided on a scale. It is the best form for showing large geographical areas, but is less suitable for showing the positions of points on the earth. The Logarithmic Projection is a modification of the Mercator, and is useful for showing large areas, but is not so suitable for showing the positions of points on the earth. The Orthographic Projection is a modification of the Mercator, and is useful for showing large areas, but is not so suitable for showing the positions of points on the earth. The Conformal Projection is a modification of the Mercator, and is useful for showing large areas, but is not so suitable for showing the positions of points on the earth. The Equidistant Projection is a modification of the Mercator, and is useful for showing large areas, but is not so suitable for showing the positions of points on the earth. The Stereographic Projection is a modification of the Mercator, and is useful for showing large areas, but is not so suitable for showing the positions of points on the earth. The Azimuthal Projection is a modification of the Mercator, and is useful for showing large areas, but is not so suitable for showing the positions of points on the earth. The Polyconic Projection is a modification of the Mercator, and is useful for showing large areas, but is not so suitable for showing the positions of points on the earth. The Conic Projection is a modification of the Mercator, and is useful for showing large areas, but is not so suitable for showing the positions of points on the earth. The Polyconic Projection is a modification of the Mercator, and is useful for showing large areas, but is not so suitable for showing the positions of points on the earth. The Conic Projection is a modification of the Mercator, and is useful for showing large areas, but is not so suitable for showing the positions of points on the earth. The Polyconic Projection is a modification of the Mercator, and is useful for showing large areas, but is not so suitable for showing the positions of points on the earth.
The surface of the sphere opposite the one to be delineated. If the globe were transparent, the eye would then see the opposite concave surface. Contrary to the orthographic, this method contracts the centre of the map, and enlarges it towards the circumference. Owing to the unequal area of the divisions, and the difficulty of finding the true latitude and longitude of places, this projection is not much employed. (3) In order to rectify the opposite effects of the two preceding, the globular projection, a modification of the two, is generally adopted. If we suppose the eye to be removed from the surface to a distance equal to the sine of 45° of the circumfluent circles, the projection is called globular. In other words, if the diameter of the sphere be 200 parts, it must be produced 70 of these parts in order to give the point of projection. All meridians and parallels in this projection are in reality elliptical curves; but as they approach so nearly to circular arcs, they are very rarely shown otherwise.

The construction of the globular or equidistant projection is as follows (fig. 1): Describe a circle, N 15 S W, to represent a meridian, and draw two diameters, NCS and WCE, perpendicular to each other, the one for a central meridian, the other for the equator. Then N and S will represent the north and south poles. Divide each of the quadrants into nine equal parts, and each of the radii, CN, CE, CS, and CW, also into nine equal parts. Project NS both ways, and find on it the centres of circles which will pass through the three points 80°, 90°, 70° 70°, &c., and these arcs described on both sides of the equator will be the parallels of latitude. In like manner, find on WE produced the centres of circles which must pass through o, b, &c., and the poles. Having selected the first meridian, number the others successively to the east and west of it. A map may in this way be constructed on the rational horizon of any place.

The impossibility of getting a satisfactory representation of special parts of the sphere by any of the previous methods leads to the desire for others less defective. Of all solid bodies whose surfaces can be accurately developed or rolled out upon a plane without alteration, the cone and cylinder approach nearest to the character of the sphere. A portion of the sphere between two parallels not far distant from each other corresponds very nearly to a like conical zone; whence it is that conical developments make the best projections for limited portions of the earth's surface, and even with some modifications for more extensive portions.

A conical projection of Europe (fig. 2) is constructed thus: Draw a base line, AB; bisect it in E, and at that point erect a perpendicular, ED, to form the central meridian of the map. Take a space for 8° of latitude, and, since Europe lies between the 35th and 75th parallels of latitude, mark off eight of these spaces along ED for the points through which the parallels must pass. The centre from which to describe the parallels will be the point in ED where the top of a cone, cutting the globe at the 45th and 55th parallels of latitude, will pass through the North Pole at C. On the parallels of 45° and 65°, where the cone cuts the sphere, mark off equivalents to 8° of longitude, in proportion to the degrees of latitude in these parallels, and if straight lines be drawn through these points parallel to CE, they will represent the meridians for every 8°. A modification of the conic projection, suitable for more extensive portions of the sphere, as of Asia, is obtained by giving on each parallel of latitude the true meridianal proportional distances, which results in a curve of the meridian lines outward from the centre of the map.

In all the projections hitherto described the direction either of the north and south, or of the east and west, is represented by a curved line, so that on such a map the course of a vessel would almost always be laid down in a curve, which could only be described by continually laying off from the meridian a line at an angle equal to that made with the meridian by the point of the compass at which the ship was sailing. If the vessel were to steer in a direct north-east course by one of the previous projections, she would, if land did not intervene, describe a spiral. The mariner, however, requires a chart which will enable him to steer his course by compass in straight lines only. This valuable instrument is supplied by Mercator's chart, a cylindrical projection in which all the meridians are straight lines perpendicular to the equator, and all the parallels straight lines parallel to the equator. It is constructed thus (fig. 3):

For a table of meridional parts (a table of the number of minutes of a degree of longitude at the equator comprised between that and every parallel of latitude up to 89°) take the distances of the parallels, tropics, and arctic circles from the equator, and mark them off to north and south of it. Join these points, and the projection is made.
This projection, of course, does not give a natural representation of the earth, its effect being to exaggerate the polar regions immensely. The distortion in the form of countries and relative direction of places is rectified by the degrees of latitude being made to increase proportionally to those of longitude. There are other cylindrical projections of the sphere, but this is the most generally valuable and best known. It gives an unbroken view of the earth's surface with the exception of the poles, which are infinitely remote.

Historical.—The ancient Greeks considered Anaximander (560 B.C.) as the inventor of cartography; but there is evidence that about 1000 years earlier some attempts in that direction had been made amongst the Egyptians. Necessarily these efforts were of the crudest, and were made upon the supposition that the earth was a plane. After Aristotle the spherical theory was adopted, and the application of astronomical observations to geography was first made by Pytheas of Massilia (326 B.C.), and the first attempts at projections by Dioclesarchus of Messana (310 B.C.). Ptolemy's (150 A.D.) rational teaching had an ultimate valuable influence in the treatment of cartography, although the Romans made little progress in the art, which during the middle ages also showed almost no advance. In the 14th and 15th centuries a gratifying improvement is observable in Italian nautical charts. In the 15th century the revivals of Ptolemy's teaching produced a revolution in the construction of maps, and laid the foundation of modern cartography. There was great increase in the number and importance of maps. The first attempts to improve and increase the methods of projection known to the Greeks were made by Germans, viz. Johann Stöffer (1452-1536), and Peter Apianus (1496-1552), &c. In the same period that Mercator (Gerhard Kremer, 1512-1594) made his invaluable contributions, the Italians, Germans, and Dutch were active competitors in geographical work. Amongst the increasing host of names connected with the subject are found that of Sebastian Cubet (1544), who produced his map of the world. In Germany, Johann Baptist Homann (1644-1724) and Tobias Mayer (1723-86) occur; in France, Nicolas Sanson (1600-67), Guillaume de l'Ile (1675-1726), and Jean Baptiste Bougignon d'Anville (1697-1782); and in Italy, P. Vincent Cornelli (d. 1718). In the 18th century France led the way in cartography by state survey resulting in the Carte Géométrique de la France. The British Ordnance Survey was begun in 1784.

In our own times excellent maps are produced by the million accessible to all classes, and are of great account for educational purposes. The most prominent names of recent cartographers are—German: Kiepert, Berghaus, Petermann, Hassensch, Habenicht, Justus Perthes, &c.; Italian: Guido; Coro; British: Arrowsmith, Hughes (educational), Ravenstein, and the geographical arms of W. & A. K. Johnston, E. Stanford, and Bartholo-

new & Co. See also the articles Contour Lines, Degree, Earth, Latitude and Longitude, Meridian, Ordnance Survey.

Map (less correctly, Maps), Walter, a great 12th-century writer, was born on the Welsh marches, perhaps in Herefordshire, about 1137. He studied at the university of Paris, became an intimate friend of Becket, was a justice-in-eyre at Gloucester assize in 1175, attended the king the same year to Limoges, and for many years later, probably as chaplain, and was sent on missions to Paris and to Rome. He enjoyed the living of Westminster in Gloucestershire, where he had a long feud for his rights with the monks of a neighbouring Cistercian convent, and became canon of St Paul's and precentor of Lincoln, but still continued his attendance on the king. In 1197, under Richard I., he became archdeacon of Oxford, and died before 1210. Map, who was Welsh, was a frank, open-hearted man, with a quick wit, bold humour, and an indignant contempt for hypocrisy. All these qualities

Map of British Islands, reduced from the Latin Ptolemy of 1478.

315
are revealed in a number of Latin satirical poems long connected (and apparently on good grounds) with his name. Of these the chief are the Gallic series (Apologi primae Galiae. Prodicticio, Confessio, &c.). In the latter occurs the famous 'Meum est propitium in taberna mori,' which is far more a stern satire by self-revelation than a jovial drinking-song, as often understood. In Bishop Golias the writer has realised by creative imagination a type of the thalid priest, and upon his head he pours out the vials of his wrath and scorn, with humour rich, bold, sometimes coarse, but always honest. Map seems to have kept well the secret of his authorship, for even his friend Giralbhus Cambrensis did not know their origin, as we find him, with the churchman's proverbial dislike to see the immortal point out the stains upon his cloth, denouncing Golias as a foul-mouthed scoffer.

Sir Galahad, the stainless knight, who Map's creation, and there is the best reason, with M. Paulin Paris, to connect him the heart and soul of that contemporary work of Christian spiritualisation which systematised and gave a meaning to the detached Arthurian romances. He wrote most probably the Latin original of Robert Borrone's introductory romance of the Saint Graal, and certainly Lancelot of the Lake, the Quest of the Holy Grail, and the Mort Arutus. M. Paris confines his direct work to the two Graal romances and the opening of Merlin.

Thomas Wright edited for the Camden Society Map's Latin Poems (181) and the Dr Napi’s Orationem (1839), an interesting kind of note-book of the court-gossip and events of the day, interspersed with theological polemics, anecdotes, and accounts of miracles, fairy legends, or apparitances fantasticae, and the discussion against marriage sent by Valentinus to the philosopher Helena.

**Maple** (Acer), the typical and the principal genus of the natural order Averaceae. The species are numerous, all are deciduous trees, and natives of the temperate parts of the northern hemisphere, and particularly numerous in North America and the north of India. They have opposite leaves without stipules, usually banded palmate. The flowers are in axillary corymbs or racemes of no beauty, but abundant in honey, and are very attractive to bees. The fruit is formed of two small winged nuts, each with one or two seeds.—The

---

**Fig. 1.**—*A. campestre*; b, Japan Maple (*A. palmatum*).

Common Maple (*A. campestre*), a small tree, is a native of Britain, and of many parts of Europe and Asia. The wood is compact, fine grained, and takes a high polish; hence it is much used by turners and for carved work, being frequently substituted for the wood of the Holly and Box by mathematical instrument makers. Several nearly-allied species are found in the south of Europe.—The Striped Bark Maple (*A. stratum*) of North America, where it often forms great part of the undergrowth in woods, is so named because the smooth bark of the two-year-old branches are beautifully varied with green and white stripes; its wood, which is very white, is used for inlaying in cabinet-work.—The Greater Maple or Sycamore (*A. pseudo-platanus*), commonly called

---

**Fig. 2.**—Greater Maple (*A. pseudo-platanus*); a, fruit.
require a dry and sheltered situation.—The Nor-
way Maple (A. platanioides), a native of the north
of Europe, although not of Britain, is also found in
New England. This species grows at Shaker Village, a
Hinsdale species (A. villonum), a noble tree,
found with pines and birches at great elevations,
is sometimes grown in Britain. A large number
of interesting and remarkably beautiful forms of
species, Japanese species of Acer, such as A. dissec-
tum and A. palmatum, have been introduced within
the last few years; they have proved hardy in many
favored districts of England and Ireland, but are
unsuited to Scotland generally, though they are
occasionally seen there in conservatories cultivated
in their native climate.

Maqui (Aristotelia Maqui), the only known
species of the genus, which belongs to the natural
order Tiliaceae, and has been made the type of a
proposed order. It is an evergreen or sub-ever-
green shrub, of considerable size, a native of Chili.
The Chilians make a wine from its berry, which
they administer in malignant fevers. The wood is
used for making musical instruments, and the
tough bark for their strings. The Maqui some-
times ripens fruit against a wall in England, and
is frequently cultivated as an ornamental shrub.

Mar, an ancient district of Scotland between
the Dee and the Don, comprising nearly the south-
half of Aberdeenshire, now separate counties of
Aberdeen, Moray, and Kincardine. In 1014 a Mormar of
Mar was present at the battle of Clontarf; and in
1115 another figure in the foundation charter of
Scone priory as 'comes' or earl. The male line of
the earls of Mar expired in 1577 with Thomas, thirteenth earl, whose sister Margaret,
made William, first Earl of Douglas. Their
dughter, Isabella, in 1404 married Alexander
Stewart, the 'Wolfe of Badenoch,' who, after her
death in 1419, was designated Earl of Mar. The
earldom by right should have gone to Jaret Keith,
her great-granddaughter of Graeme, eleventh Celtic
earl, and wife to Sir Thomas Erskine; but it was
not till 1565 that it was either restored, or else
granted by a new creation with limitation to heirs
male, to their sixth descendant, John, sixth Lord
Erskine, who held the title in 1610 and was then
a twelvemonth regent of Scotland. John, Earl of
Mar (1675-1732), who began life as a Whig, and by his
frequent change of sides earned the nickname of
'Bobbing Joan,' headed the rebellion of 1715 (see
JACQUETTES), and died in exile at Aix-la-Chapelle.
In 1832 the heir of his attainder was proclaimed
by his grandson, John Francis Erskine, but his
grandson dying without issue in 1866, the question
arose whether the earldom of Mar could pass
through his sister to her son, John Francis Good-
ev-Erskine (ne Goodewe), or must go to his first
cousin, Walter Coningsby Erskine, Earl of Kellie.
And the strange solution of that question has been
that in 1875 Walter Henry Erskine, thirteenth Earl
of Kellie, was declared by the Committee of Privi-
elges also eleventh Earl of Mar, and that in 1885
the House of Commons confirmed the decision.
Walter Coningsby Goodewe-Erskine twenty-sixth Earl of Mar, claiming
creation before 1014, but allowed precedence
1404. See the Earl of Crawford's Earldom of Mar

Marabout Feathers. See ADJUTANT.

Marabouts, a name derived from the Arabic
word mothlit, and used to designate a religious
divinity in Moslem countries. They have been
chiefly in North Africa, and have at times exercised
considerable political influence, as in encouraging
opposition to the French conquests in Algeria and
Tunis in the 19th century, and in former centuries
as the origin and mainstay of the Almoravid
dynasty, which held Morocco and Spain for a
long period. These devotees are held in great
veneration by the Berbers; they frequently officiate
at mosques and chapels, and are believed to possess
the power of acquiring money in strange forms (e.g.,£500,000). The
dignity is generally hereditary. The name is also
applied to the tombs of the devotees.

Maracaybo, a fortified city of Venezuela, lies
situated on the west shore of the strait which
connects the lake and gulf of Maracaybo. It is a
handsome town, with many gardens and squares,
colleges, hospitals, a theatre, a German club-
house, the hospital and government buildings, a custom-
house, wharves, and a number of manufactories.
The climate is hot, the soil sandy, and the place
unhealthy, owing mainly to the unsanitary domestic
arrangements. The trade is chiefly in the hands
of Germans and North Americans. The staple export is coffee (£1,367,291 in 1889);
loxwood, lignum vitae, cedar, and other woods, besides
divi-divi, hides and skins, and some cocoa, guns,
and fish sounds, are the other exports, the value of
which (including coffee) in 1889 reached about
10,500,000. The Guajira peninsula of New-Holland,
the United States, although most of the merchandise
imported comes from Great Britain, Germany, and
France. Pop. (1888) 34,284.

The Gulf of Maracaybo is a wide inlet of the
Caribbean Sea, extending from the peninsula of
Paragua to the mouth of the river Guajira, and is
connected with the lake. The latter forms the
gulf of a great valley, split in by lofty mountains.
Its waters are sweet, and deep enough for the
largest vessels; but the bar at the mouth, where
swift current runs, makes entrance difficult. The
gulf and lake were discovered in 1490 by Ojeda,
who found here houses built on piles, and so
gave the district the name Venezuela ('Little
Venice'), which was afterwards extended to the
entire country.

Maragha, a town of western Persia, 55 miles
S. of Tabriz and 20 miles E. of Lake Urin. It
is celebrated as the capital of Hulagu Khan, grand-
son of Genghis 'Khan, and as the site of the
observatory which Hulagu built for the astronomer
Nas ed-Din. Pop. 13,200.

Marajó, an island situated between the- streams
of the Amazon and Para, with an area of nearly
18,000 sq. m. It is one of the most part low
and covered with grass and bush, but in the east
and south with dense forest. The soil is fertile,
and large herds of cattle are reared in the
north-east.

Maranhão, or Maranhão, a maritime state
of Brazil, bounded on the north by the Atlantic
Ocean, and an area of 17,560 sq. m. and a pop.
(1888) of 488,443. The surface is uneven, but there
is, no range of mountains. There are numerous
crivers falling into the Atlantic, large forests,
extensive plains where cattle are reared; the climate
is fine, the soil fertile. Agriculture, however, has
not prospered here, and the emancipation of the
slaves, on whose labour it had depended, was
followed by a period of great depression. Cotton
and sugar are the principal products.—The chief
city is Maranhão, or San Luis de Maranhão, on
an island between the mouths of the Meatin and
the Japiacu. It is a well-built town, clean, gay,
hospitable, and has a pop. of 35,000. It contains
a cathedral and bishop's palace, a hospital, a techni-
cal school, some sugar and spinning and weaving
factories, and docks that admit ships drawing 14
feet. The chief exports (varying from £200,000 to
near £500,000 in some years) are cotton and sugar;
then come hides and goat and deer, skins, gum,
balsam, cotton-seed, indin-rubber, &c. Portugal
is the largest customer, followed by Britain, which
sends three-fourths of the total imports (about
£920,000 annually).
Marathon. Jean Paul, one of the most prominent figures in the French Revolution, was born at Bondry in Neuchâtel, May 24, 1743, eldest child of Jean Paul Mara, a physician and native of Caglari, who had married Louise Cabrol, a Genevan Protestant. He studied medicine at Bordeaux, next went to Paris, then to London, where for some time he practised his profession with success, and published a materialistic Philosophical Essay on Man (1773), sharply attacking Hébert, and anonymously a political essay, The Chains of Slavery (1774). In 1776 he paid a visit to Edinburgh, and was made on June 30, on the recommendation of certain Edinburgh physicians, M.D. of St Andrews University; and it hardly admits of doubt that he was the John Peter le Maire, alias Maire, alias Mara, who got five years at Oxford ansizes in March 1777 for stealing coins and medals. For in June 1777 his character and reputation as a physician and occultist stood so high that he was made brevet-physician to his guards by the Comte d'Artois, afterwards King Charles X., an office which he held till 1786. Meanwhile he continued his scientific work in electricity, and the formation of Franklin and Gaspard de Prony, but the Académie des Sciences refused him admission on account of his attack on Newton. Further writings were his anonymous Plan de Législation Criminelle (1780), a translation of Newton's Optics (1787), and Montesquieu's, ou Nouvelles Découvertes sur la Lumière (1788).

But all Paris was now infected with the fever of revolution, and Marafl flung himself with characteristic ardour into the war of pamphlets, and at length in September 1789 established his famous and immortal journal, L'Ami du Peuple. Throughout he fought ever for his own hand, with bicorne, honesty and indomitable persistence, constantly croaking of treachery in high places, and denouncing with feverish suspiciousness in turn Necker, Bailly, Lafayette, the king, Dumouriez, and the Girondins. His most vehement hatred, and covered his own hand with calumies which survived for generations; but it made him the darling of the scum of Paris, and placed great power in his hands at some of the more rudimentary phases of the revolution. His printing press had to be cunningly concealed from Lafayette's police, twice at least he had to flee to London, and once he was forced to hide for a time in the sewers of Paris, where he contrived a leathen skin disease, yet was tender with affectionate faithfulness by Simonne Evard, whom he had married 'one fine day in presence of the sun.' His sufferings deepened his frenzied hatred and suspicion of constituted authority, and there can be no doubt that on his head rests in great measure the guilt of the September massacres. He was elected to the Convention as one of the deputies for Paris, and was perhaps the most unpopular man within the house, where indeed his influence never became more than contemptible. On the declaration of the republic he started his paper anew under the title Journal de la République Française. After the king's death his last energies were spent in a mortal struggle with the Girondins, who unsubscribed their own downfall when their formal accusation of Marafl failed before the tribunal. He died on Oct. 5, 1793, to his country's last triumph. He was dying fast of the disease he had contracted in the sewers, and could only write sitting in his bath. There his destiny reached him through the knife of Charlotte Corday (q.v.), in the evening of the 15th July 1793. His body was committed to the Panthéon with the greatest public honours, to be cast out but fifteen months later amid popular execration.

See the History of the French Revolution by Mignet, Thiery, Michelet, Louis Blanc, Carlyle, Von Sybel, and H. Morse Stephens; A. Bougre, Marat et les Enfants du Peuple (2 vols. 1894); but especially the works by F. Chevermont, Marat, Index du Bibliophile (1876); Placards de Marat (1877); and his exhaustive Jean Paul Marat, capitopolitique, accompagné de sa vie, philosophique, et poétique (2 vols. 1881).

Marath. See Mahrrattas, India.

Marathon, a village on the east coast of ancient Attica, 22 miles N.E. of Athens, long supposed to be the modern Marathona. It stood in a plain 6 miles long and from 3 to 13 miles broad, with a background of mountains in the north, and a marsh both on the north and south; eastward it reached the sea—'The mountains look on Marathon, and Marathon looks on the sea.' Recent investigations by Prussian officers identify the historic village with that of Branda, nearly 25 miles to the south, and locate the battle in the plain between the mountain Stavrkorakoi and the sea, nearly 3 miles north-east of Branda. The name of Marathon is gloriously memorable as the scene of the great defeat of the Persian hordes of Darius by the Greeks under Miltiades (490 B.C.)—one of the decisive battles of history. It is now partly covered with a green mass of corn, on which two roads come together, and a large stone, covered with grass, is seen in the middle.

Maraveidi, an old Spanish copper coin in use from 1474 to 1484, was worth about 1/3 of a penny. There were also, at an earlier period, maravedis of gold and of silver.

Marbeck, or Merbeck, John, organist of St George's Chapel, Windsor, was condemned to the stake about 1544 for favouring the Reformation, but pardoned on appeal to the Pope. In 1550 he published his famous Booke of Common Prater Noted, an adaptation of the plain chant of the earlier rituals to the first liturgy of Edward VI. He wrote several theological and controversial works; and a hymn for three voices and parts of a mass by him are extant. He died about 1585.

Marble, in its strict and proper sense, is a rock crystallized in a minutely-veined manner, having the fracture of loaf-sugar, and composed of carbonate of lime, either almost pure when the colour is white, or combined with oxide of iron or other impurities which give various colours to it. But many other kinds of stone are popularly included under the name marble, and indeed sufficiently compact to admit of a polish is called marble. It is only in this vague sense that the indurated amorphous rocks used in Britain can receive this name. Such are the black, red, gray, and variegated limestones of the Devonian system, which are very beautiful from the numbers of exquisitely-preserved corals which abound in them; the marbles of the Carboniferous series from Flintshire, Derbyshire, and Yorkshire, so full of foraminifera; the shell marbles from the Oldic rocks at Ranic, Stannard, and Movio; and the dark Purbeck and Dover marbles, beautifully figured with shells, from the Weldon strata, which were so much used by the architects of the middle ages.

Searcarine or statuary marble is a white fine-grained rock, resembling loaf-sugar in colour and texture, but much more freely veined, being liable to splinter, and taking a fine polish. Of the marbles used by the ancients, the most famous was Parian marble, a finely granular and very durable stone, with a waxy appearance when polished, which were used in the finest Greek sculptures were formed of this marble, and the famous Venus of Medici. The marble of Pentelia was at one time preferred by the Greeks to Parian, because it was whiter and finer grained. The Pantheon was entirely built of it, and many
famous statues still remain which were executed in this marble, but they are always more or less wretched, retaining the beautiful finish of the Parian statues. The Roman marbles at Carrara (p.x) were known to the ancients, but they have been more extensively wrought for modern sculptors, who use this marble chiefly. It is a fine-grained, pure white marble, but is so often traversed by gray veins that it is difficult to get large blocks free from these. Of coloured marbles, the best known are the Rosso Antico, a deep blood-red, sprinkled with minute white dots; Verde Antico, a cloudb green produced by a mixture of white marble and green serpentine; Giallo Antico, a deep yellowish; and Nero Antico, a deep black marble.

A true marble is a crystalline granular aggregate of calcite, the granules being of remarkably uniform size. Not infrequently shades of mica or talc occur scattered through the rock. Such a rock is of metamorphic origin; it is simply a limestone which has been rendered entirely crystalline from the effects of heat under pressure, as in the vicinity of large intrusions of igneous rock. Marble may therefore be of any geological age. Many crystalline marbles were are still quarried. Of the name of marble, occur associated with gneises and mica-schists, and are often rich in such minerals as garnet, actinolite, zoisite, mica, &c.

**Marblehead**, a seaport town of Massachusetts, on a rocky promontory, 18 miles N.E. of Boston. Its share in the fisheries is no longer important, and the manufacture of boots and shoes is the chief industry. Pop. (1890) 9292; (1900) 7582.

**Marburg**, a quaint old town in the Prussian province of Hesse-Nassau, on the Lahn, 59 miles by rail N. of Frankfort and 64 S.W. of Cassel. It is built on a terraced hill, whose summit is crowned by a stately castle, dating from 1065. In its Rittersaal (1277-1312) was held in 1299 the conference between the Wittelsbeger and the Swiss reformers regarding the Lord's Supper. The fine Gothic church of Elizabeth with two towers 243 feet high, was built in 1253-83 by the Tendentian Knights over the splendid shrine of St. Elizabeth (q.v.), where the restored castle is now erected. The university occupies new Gothic buildings of 1870. It was founded in 1327 in the Reformed interest by Philip the Magnanimous, Landgrave of Hesse; and among its earliest students were Patrick Hamilton and William Tyndale. It has about 80 professors, and 2000 students. Besides, it is a college of philosophy, medicine, theology, and jurisprudence, and a library of 120,000 volumes. Pop. (1875) 9650; (1885) 12,605; (1890) 14,520. See three works by Kolbe (Marburg, 1871-84).

**Marcantonio**, or in full, M. RAIMONDI, an Italian engraver, born at Bologna late in the 15th century. A goldsmith by trade, he early turned to engraving, and received his first great stimulus from woodcuts of Albrecht Dürer, which he saw at Venice about 1505. He copied on copper two sets of plates from the German master's designs for the book 'Life of the Virgin' and the 'Passion of Christ' (see DÜRER). At Rome, where he worked from 1510, he was chiefly engaged in engraving Raphael's works, as 'Lucetta,' the 'Massacre of the Innocents,' the 'Three Doctors of the Church,' 'Adam and Eve,' 'Dido,' 'Poetry,' the 'Judges of Paris,' and several more. Raphael's pupil, Giulio Romano. On account of the power of his drawing and the purity of his expression, he is accounted the best amongst the engravers of the great painter. The capture of Rome by Sinibaldo Bourbon in 1527 drove Marcantonio back to Bologna, where he probably remained until he died, some time before 1534 came to an end. See the essay by Fisher prefixed to the catalogue of his engraved works exhibited in London in 1838, and Delaborde's monograph (Paris, 1887).

**Marcasite**, an iron ore, a variety of Pyrites (q.v.).

**Markou, François Séverin DESGRIEVES**, French general, was born at Chartres on 1st March 1769. On the outbreak of the Revolution he was appointed Inspector of the national guard in his native town, and in 1792 helped to defend Verdun with a body of volunteers till its surrender. His brilliant military career was ended four years from this time; but they were four years of stirring activity. Sent in the following year to join the republican army in La Vendée, he was, for his services in the engagements before Saumur and Le Mans, promoted to the rank of general of division. Then, proceeding to the north-east frontier, he commanded the right wing at Fleurus, and after the allies retreated occupied Coblenz. During the campaign of 1796 he was given command of the first division of Jourdan's army, and sat down to invest Mainz, Mannheim, and Coblenz. But whilst covering the retreat of the French at Altenkirchen he was shot, on 19th September, and died four days later. His body was buried in the entombed camp at Coblenz, but was transferred to the Panthéon in Paris in 1889. He ranks next to Marmont in the annals of the army, and is mainly in the early years of the Revolution, not only for military genius, but also on account of the nobility and uprightness of his personal character. See Lives by Donble de Boishilaut (1815), Maze (1888), and Captains T. G. Johnson (1890).

**Marcello, BENEDETTO**, musical composer, born in Venice on 1st August 1866, was a judge, the reliable, and a member of the Council of Egypt, and afterwards held important administrative offices at Palma and Bresica, where he died on 24th July 1739. He had a passion for music, and is remembered as the composer of music for Giulianetti's version of the Psalms (8 vols. 1724-27), of numerous concerted, canzonets, cantatas, a pastoral, an oratorio, and other pieces, distinguished for their simple yet elevated style, and as the author of a satirical work, *Il Teatro alla Moda* (1729).

**Marcellus**, the name of two popes, of whom the second deserves special notice, as having, when bishop of Rome, a maritime disposition, which was one part in the discussions of the Council of Trent, over which he was appointed to preside as legate of Julius III. He was elected pope 10th April 1555, and survived his elevation but twenty-two days. He did not follow the usual custom of laying aside his papal vestments and assuming a new one.

**Marcellus, M. CLAUDIUS**, a famous Roman general, of one of the most eminent plebeian families. In his first consulship (222 B.C.) he defeated the Insubrian Gauls, and slew with his own hand their king, Britonartus or Viridomaros, whose spoils he dedicated as *spolia opima* to Jupiter of the third, of whom some say he was a pupil. In the Second Punic war Marcellus took command after the disaster of Cannae, and put a check upon the victorious Hannibal at Nola, in Campania (216 B.C.). Again consul in 214 B.C., he gave a great naval victory and the defeat of the Siculi, but his efforts to take Syracuse were rendered unavailing by the skill of Archimedes, and he was compelled to regularly blockade the city. Famine, pestilence, and ultimately treachery on the part of the Spanish auxiliaries of the Syracusans, opened its gates (212 B.C.), after which the remainder of Sicily was soon brought under the dominion of the Romans.
in his 5th consulship, 208 B.C., he fell in a skirmish against Hannibal.

**Marcet**, Jane, known as Mrs MARCET, the author of a very popular elementary introduction to chemistry entitled *Conversations on Chemistry*, through which Faraday made his first acquaintance with the science. She was the daughter of a rich London merchant, a Swiss by birth, and herself born at Geneva in 1760. She married Alexander Marcet, a Genevan, who settled in London as a doctor in the last years of the 18th century, and later in life devoted himself to experimental chemistry. Besides the book on chemistry, which reached the 18th ed. in 1833, she wrote *Conversations on Political Economy* (1816; 7th ed. 1839), which was warmly praised by J. B. Say, by M'Culloch, and by Lord Macaulay; *Conversations on Natural Philosophy* (1819; 13th ed. 1838), and similar books on Botany (9th ed. 1810), *Vegetable Physiology*, &c., besides numerous charming Stories for very Little Children, in the estimation of many her best work. She died in London on 28th June 1838. See Harriet Martineau's *Biographical Sketches* (1849).

**March** (Slav. Morava), the principal river of Moravia, rises on the boundary between that country and Prussian Silesia, and flows 214 miles south to the Danube, which it joins 6 miles above Presburg. It receives on the right the Thaya. In its lower course it forms the boundary between Austria and Hungary according to our present calendar, consists of thirty-one days. It was considered as the first month of the year in England until the change of style in 1752, and the legal year was reckoned from the 25th March. Its last three days (old style) were once popularly supposed to have been borrowed by March from April, and are proverbially stormy.

**March**, a musical composition, chiefly for military bands, with wind-instruments, intended to accompany the marching of troops. There are slow and quick marches, and marches peculiar to different countries. Marches are also introduced into oratorios, the best-known examples being the 'Dead March' from the oratorios of **Handel**, and **Weelschen's** 'Wedding March.'

**Marchantia.** See Liverworts.

**Marchena**, a town of Spain, 47 miles by rail E. of Seville, with a duel (Arcos) palace, and sulphur-baths. Pop. 13,765.

**Marches**, the border districts that run contiguous on each side of the boundary line between England and France, and between England and Wales. The Lords of the Marches were the nobles to whom estates on the borders were given, on condition that they defended the country against the aggressions of the people on the other side. Under the Norman and Plantagenet kings of England, and thereafter, almost the same, the Marches, as the English Lords of the Marches and the Welsh, for the Scottish English Marches, see Border.—The Mortimers, Earls of March, took their title from March in Cambridgeshire. The corresponding German word Mark was in like manner applied to the border countries or districts of the various monarchies, conquered from neighbouring nations—the marks of Austria, of Brandenburg, Altmark, Steiermark, &c. The governors entrusted with the charge of these marks were called mark-grafs or margraves, corresponding to the English and Scottish Wardens of the Marches (see **Marquis**). The ancient German tribe of **Marchonneaux** were 'Marchonneaux' in Italy. The Marches include the March of Ancona (E.) and three other provinces (see **Italy**).

**Marchetti,** Filippo, an operatic composer, born at Rome in 1835, became in 1881 president of a musical college in Rome. His best-known opera are **Romeo e Giulietta** (1865) and **Ruy Blas** (1869).

**Marcia, an agricultural town of Italy, situated in a marshy district, 12 miles by rail N. of Naples. Pop. 21,803.

**Marchion, the founder of the Marcionites, a rigorously ascetic sect which attained a great importance between the years 150 and 250 A.D. He was a native of Sinope in Pontus, became wealthy as a shipowner, and about 140 repaired to Rome. There he laboured to correct the prevailing views of Christianity, which he considered to be a corruption of Jewish errors with the gospel of Christ as expanded by Paul, its best interpreter. The opposition which he encountered drove him to found a new community about 144, and he laboured earnestly and profoundly inculcating his theology until his death about 165. Marcion was hardly a Gnostic, although he had been intimate with Cerdo, and Gnostic speculations certainly influenced the development of the Marcionite theology. Failing to recognise the New Testament God of love in the Old Testament, and profoundly influenced by the radical Pauline antithesis of law and gospel, he constructed an ethico-dualistic philosophy of religion, and proceeded to cosmological speculations which are not free from contradictions. He set aside as spurious all the gospels save Luke, and it is as well that we are not为此接續的被purged of Judaising interpolations. He was thus the earliest to make a canonical collection of New Testament writings. From about the beginning of the 4th century the Marcionites began to be absorbed in the Manichæan. Marcion's doctrines can be discovered from the controversial writings of Fathers, as *Terullian*, *Hippolytus*, *Epiphanius*, &c. See works of *Baur*, *Möller*, *Lipsius*, and *Harnack* quoted under **Gnosticism**.

**Marco Polo.** See **Polo**.

**Mardi Gras.** See Shrove-Tide.

**Mardin,** a town of Asiatic Turkey, is strikingly situated on the southern slopes of the Mardin Hills, 60 miles S.E. of Diarbekir. Pop. 12,000, of whom half are Moslem Kurds.

**Mare,** Loch, a beautiful lake of Ross-shire, 40 miles W. of Dingwall. Lying 32 feet above sea-level, it is 12½ miles long, 2½ furlongs to 3½ miles broad, 360 feet deep, and 11 sq. m. in area. It is overhung by mountains, 3000 feet high; sends off the Ewe, 3 miles long, to the sea; and contains twenty-seven islets, one with remains of an ancient chapel and a 12th-century statue of St. Clovis. At Loch Maree in 1877 is described in her *More Leaves* (1884).

**Maremma (corrupted from *Maritima*, 'situated on the sea'), a marshy region of Italy, extending along the sea-coast of Tuscany from the river Cecina to the Orbetello, and containing afterwards the territories of about 1000 sq. m. The Pontine Marshes and the Campaign of Rome are similar districts. In Roman times and earlier the Maremma was a fruitful and populous plain; but the decay of agriculture, consequent upon unsettled political history, fostered the emigration of alluvial, which to this day is supreme in great part of these stricken districts. Leopold II. of Tuscany directed especial attention (1824-44) to the drainage and amelioration of the Maremma, and his efforts and subsequent measures
have been attended with considerable success.

Cresset...Marengo, a village of Northern Italy, in a marshy district near the Bornida, 3 miles SE. of Alessandria. Here on 14th June 1800 Napoleon, with 32,000 French, defeated 30,000 Austrians under Melas. It was the cavalry charge of the younger Kellermann that turned what looked like certain defeat into a decisive victory, though the French lost 7000 in killed and wounded, the Austrians 8000 (by lines 3000 prisoners).

Marcolis, or Marcella, Lake, the modern L Morveld, a salt lake or marsh in the north of Egypt, extends southward from Alexandria, and is separated from the Mediterranean, on its north-west side, by a narrow isthmus of sand. In the 15th and 16th centuries it was a navigable lake; but in 1798 it was reduced to a sandy plain; but in 1801 the English army cut the dikes of the canal that separated the Lake of Aboukire from Marcolis, to cut off the water-supply of the French, and Marcolis became once more a navigable lake.

Margaret, St, Scottish queen, was born about 1050 in Dunfermline, and from 1057 was brought up at the court of her great-uncle, Edward the Confessor, with Lanfranc for her spiritual instructor. In 1068, with her mother and sister and her boy brother, Edgar the Atheling (q.v.), she fled from Northumberland to Scotland. Young, lovely, learned, and pious, she won the heart of the rude Scottish king, Malcolm Canmore (q.v.), who next year wedded her at Dunfermline. 'Perhaps,' says Skene, 'there is no more beautiful character recorded in history than that of Margaret. For purity of motives, for a desire to benefit the people among whom her lot was cast, for deep sense of religion and great personal piety, for the unselfish and unreserved willing of whatever duty lay before her, and for entire self-abnegation she is unsurpassed.' She did much to civilise the northern realm, and still more to assimilate the old Celtic church to the rest of Christendom on such points as the due commencement of Lent, the Easter communion, the observance of Sunday, and marriage within the prohibited degrees. She built, too, a stately church at Dunfermline, and re-founded Iona. She bore her husband six sons and two daughters, and died three days after him, in Edinburg, Castle, on 10th November 1093. Innocent IV. canonised her in 1290. Her head, which had found its way from Dunfermline to Donay, was lost in the French Revolution; but her remaining relics are said to have been enshrined by Philip II. in the Escorial.

The Latin Life by her confessor Turgot, Bishop of St Andrews (Eng. trans. by Fr. Forbes-Leith, 1884); Skene's Celtic Scotland (vol. II. 1887); and Bellisarius's History of the Catholic Church of Scotland (Eng. trans. 1867).

Margaret, the 'Semiramis of the North,' queen of Denmark, Norway, and Sweden, was the second daughter of Waldemar IV. of Denmark, and wife of Hacon VIII. of Norway, and was born (1238) in the Danish nobles offered her the crown in trust for her infant son Olaf. By the
MARGINAL CREDITS

Marginal, a seaport and municipal borough of England, in the Isle of Thanet, Kent, 3 miles W. of the North Foreland and 74 E. by S. of London, has for many years been the favourite seaside resort of cockney holiday-makers, who, during the season, by rail and by steamer, pass in thousandst. Possessed of many natural advantages in its bracing air, good bathing, and excellent firm sands, Margate offers besides all the customary attractions of a watering place, with its pier (600 feet long, jetty 1050 feet of quarter of a mile in length), theatre, assembly-rooms, baths, zoological gardens, &c. It contains also two interesting churches—one exhibiting traces of Norman and Early English work, and the other with a tower of 113 feet, forming a conspicuous landmark; the Royal Sea-bathing Institution, founded 1792 and enlarged 1882; a town hall (1820); and an extensive debris and dump asylums (1875–80–86). Formerly the port was the scene of the embarkation or landing of many royal and other persons, amongst the latter being the wounded brought back from the field of Waterloo. Queen Victoria visited the town in 1833, where too for a short time Turner the painter (one of whose principal views of the church) was at school. Pop. (1801) 4769; (1811) 18,226; (1821) 18,419.

Margaux, a village 15 miles by rail NW. of Bordeaux, near the left bank of the Gironde, with a number of white villas, half-hidden amidst trellised vines. The château (a handsome Italian villa) and the celebrated vineyards are half a mile distant. Pop. 1619.

Margay (Felis tigrina), a species of cat or tiger-cat, a native of the forests of Brazil and Guiana, smaller and less handsome than the ocelot, which in general appearance it much resembles, though its spots are smaller. It is little different from the domestic cat. It is capable of domestication, and of being made very useful in rat-killing.

Marghilian, capital of Ferganah (q.v.).

Marginal Credits, a term applied to business operations, in which bankers lend the credit of their names, as it were, to their customers, and thus enable them to carry out important commercial transactions which otherwise could not be so conveniently undertaken. A merchant in Brazil, for instance, desires to import tea or silk, but his name is not so well known on the Chinese Exchanges that bills drawn upon him by a merchant in China can be sold there at a reasonable rate of exchange. The tea or silk cannot be purchased without the money with which to pay for it, and as a consequence the merchant must send out specie for that purpose he would involve himself in heavy charges for freight and insurance, and lose the interest of his money while on the voyage. Moreover, before the remittance (silver probably) could arrive, the specie drawn upon the banker must leave so altered that a purchase might not be desirable, and the money would thus be placed where it was not wanted. But, while drafts by the merchant in China on the merchant in England would not sell, or only at a heavy sacrifice, the drafts by the merchant in China on a banker in England will sell at the best price. The merchant in this country therefore deposits with his banker cash or securities equal to the amount to which he desires to use the banker's name, and receives from him Marginal Credits for the amount. These are bills drawn upon the banker, signed or endorsed, and the same is actually paid; and the ten or silk is most likely in the merchant's warehouse before the bill is payable. For the transaction, the banker charges the merchant a commission to renumerate himself for the risk involved. In recent years the use of marginal bills has largely fallen off in use and they might be the development of telegraphic communication. Merchants now prefer to arrange with their bankers for a ‘telegraphic transfer,’ by which an immediate cash payment is effected through a foreign bank.

Many transactions between merchants abroad and in this country are settled by bills of exchange, and the acceptance of a London banker being tendered in payment, but the transactions are intrinsically the same as when Marginal Credits are used. Bankers in this country obtain the acceptance of a London banker for bills to be drawn against goods their customers are importing. Bankers usually in London—also accept bills to a great amount for the exchange operations of foreign banks. A banker in, say Canton, buys from his customers bills drawn upon merchants in England for a given amount, and sends them to his corre-
spondent in London, who holds them for him and
grants a credit in his favour on the security of
their future income. Mr. banker is careful upon this
credit by drawing upon the London banker, and
sells his drafts at the most favourable exchange.
With the money received he purchases other bills,
and remits them also, to be again drawn against.
With her notifications are some cautions, warning
sound judgment they are beneficial to all con-
cerned; but when engaged in without sufficient
knowledge or recklessly they involve most disas-
trous consequences.

Marinecone, Philipp Conrad, Protestant
theologian, born at Hildesheim on 1st May 1780,
went to teach at Göttingen in 1804, was appointed a
theological professor and university preacher at
Erlangen in 1805, and subsequently held theological
chairs at Heidelberg (from 1807) and Berlin (from
1811). He died on 31st May 1846. After Hegel's
death Marinecone was the chief figure among the
right wing of that philosopher's disciples. His
Hegelian views found expression in Grundthruner
der Theologie (ed. 1827) and Gesange
1847-49). He also wrote Geschichte der deutschen
Reformation (4 vols. 2d ed. 1831-34), Institutiones
Symbolicae (3d ed. 1830), System des Katholizismus
in historischen symbolischen Entwicklung (3 vols.
1810-12), and other works.

Maria Christina, queen of Spain, born at
Naples, 27th April 1816, was a daughter of Francis
I., king of the Two Sicilies. In 1829 she became
the fourth wife of Ferdinand VII. of Spain, and
in October of that year gave birth to a daughter,
Isabella II. Ferdinand died 29th September 1833,
and by his testament his widow was appointed
regent of their children—the young Queen Isabella
and the Infanta Maria Louisa, Duchess of Mont-
pensier—and also regent. A civil war broke out
(see Carlists); but the queen-mother secured
her children from doing anything except the company
of Don Fernando Murio, whom she made her chan-
cellain, and with whom she was united, in December
1833, in a morganatic marriage. She had ten
children by him. A conspiracy, which broke out
on the night of the 13th August 1836, led the
queen-mother to concede a constitution to Spain.
In 1848 a revolution took place and she gave
up to the new prime-minister, Espartero, a renun-
ciation of the regency, and retired to France, whence
she returned in 1843. Her participation in the
schemes of Louis-Philippe as to the marriage of her
daughters in 1846, and the continual exercise of
her influence in a manner unfavourable to consti-
tutional liberty, made her hateful to the patriotic
party in Spain. At length, in July 1854, a revolu-
tion expelled her from the country, and she again
took refuge in France, but returned to Spain in
1861, after the Carlist wars in which she died at
Havre, August 1878. See Carlists, and Spain.

Maria Louisa, the second wife of Napoleon
I., born 12th December 1791, was the daughter of
the Emperor Francis I. of Austria. She was
married to Napoleon after the divorce of Josephine,
20 April 1810. On 20th March following she bore
a son, the Archduke Karl Joseph. She died at
Havre, August 1878, at the beginning of the campaign of 1813 Napoleon appointed her regent in his absence, but under many limitations.
On the abdication of Napoleon, not
being permitted to follow him into exile, she went
with her two children to Austria, and remained
there till 1816, when she received the dukies of Parma,
Piacenza, and Guastalla. In 1822 she contracted
a morganatic marriage with Count von Neipperg.
She died at Vienna, 17th December 1847.

See Lassalle (1825) and Joseph de Saint-
Amand (Eng. trans. 1886), her Correspondence (1887),
and the Memoires of Mme. Durand, her maid of honour
(1885).

Mariana, Juan, a Spanish historian, was born
at Talavera in 1556, entered at eighteen the then
rising college of the Jesuits, and was taught in
the Jesuit colleges at Rome (where Bellarmine
was one of his scholars), in Sicily, and finally in
Paris. After seven years of labour in Paris he was
appointed to ill-health to Toledo, and there he lived
in unknown poverty till his death, at an extreme
old age, in 1624. His Historia de Polos
Hispanicos first appeared in 20 books in 1592, and
was supplemented by 10 additional books, carrying
the narrative down to the accession of Charles V.,
in 1553. Its admirable Latinity and undoubted
historical merits give it an abiding value. Mariana
himself published a Spanish translation (1601-9),
which still remains one of the classics of the
language. His Tractatus VII. Theologiae et Historiae
(1609) closed the suspicion of the Inquisition.
But the most celebrated of the works of Mariana
was his work, entitled De Imitatione Regum
Institutionum (1599), which raises the question whether it
be lawful to overthrow a tyrant, and answers it in
the affirmative, even where the tyrant is not a
usurper but a lawful king. This tyrannicide
docile drew much odium upon the entire race of
Jesuits, especially after the death of Henry IV. of
Spain by Ravaillac in 1610; but it is only just to
observe that, while, upon the one hand, precisely
the same doctrines were taught in almost the same
words by several of the Protestant contemporaries of
Mariana, and by other, it was formally condemned by the general Acquaviva, and
the doctrine forbidden to be taught by members of
the order.

Mariana Islands. See Ladrones.

Mariana, an episcopal city of Brazil, 3 miles
E. of Onro Preto. The neighbouring gold-mines
are exhausted. Pop. 5600.

Marianus Scotus (1028-92), an early Irish
champion of the doctrine of the Trinity, after
his death in 1052, became a Benedictine at Cologne in 1058, and settled in the monastery at Fulda. Ten years later he
removed to Mainz, where he taught mathematics and theology. He left a Chromium Universale,
which began at the creation and came down to 1082.
It was published at Basel in 1533, and by Weitz
in 'Monumenta Germanica'.—Another Mariano
Scotus, famous as a copist and calligrapher, was
abbot of St Peter's at Ratibson in 1888.

Maria Theresa, empress, the daughter of the
Emperor Charles VI., was born at Vienna, 15th May 1717. By the Pragmatic Sanction (q.v.),
for the fulfilment of which the principal Euro-
pian powers became sureties, her father appointed her
heir to his hereditary thrones. In 1736 she
married Francis of Lorraine, afterwards Grand-
duke of Tuscany, to whom she gave an equal share in the government when, on the death of
her father, 21st October 1740, she became queen
of Hungary and of Bohemia, and Archduchess of
Austria. At her accession the monarchy was
exhausted, the finances embarrassed, the people
discontented, and the army weak; whilst Bavaria,
Saxony, and Silesia, annexed by France, put forward claims to the whole or to portions of
her dominions. Frederick II. of Prussia claimed
Silesia, and poured his armies into it; Spain laid
hands on the Austrian dominions in Italy; and
the Bavarians, assisted by the French, threatened
Bohemia, and, passing on into the archduchy of
Austria, threatened Vienna, the Elector of Bavaria

MARGRAVE

MARI THRESA
being crowned king of Bohemia and emperor as Charles VII. (1742). The young queen was saved by the intervention of the Emperor, for whose loyalty she appealed, with her infant son in her arms, in a stirring speech at the diet held in Presburg, and she was supported by the assistance of Britain, but most of all by her own resolute spirit. The war of the Austrian succession, which lasted more than seven years, was terminated by the peace of Aix-la-Chapelle in 1748. The empress-queen lost Silesia and Glatz to Prussia, the duchies of Parma, Piacenza, and Guastalla to Spain, and some Milanese districts to Bavaria. She now fully recognised, as well as that of her husband, who had been nominated emperor (1745), Charles of Bavaria having in the meantime died. During the years of peace that ensued Maria Theresa instituted important financial reforms, did her utmost to foster agriculture, manufactures, and commerce, and improved and nearly doubled the national revenues, whilst the burdens were diminished. At the same time she charged Marshal Daun to reorganise and rediscipline her armies. In Kaunitz (q.v.) she found a masterly strategist and statesman, and in his hands she left for the most part the management of the foreign relations of the empire. But the loss of Silesia, especially the conduct of Frederick the Great, which had brought upon her that loss, rankled deeply in her mind; and, France having been gained by the Stift, actually through the address of Kaunitz, she renewed the contest with the Prussian king. But the issue of the Seven Years' War (q.v.) was to confirm Frederick in the possession of Silesia. On the conclusion of hostilities the empress renewed her efforts to promote the national prosperity, ameliorating the condition of the peasantry, mitigating the penal code, founding schools, organising great charitable societies, in short promoting the welfare of her subjects by all the wise arts of peaceful progress. Her son Joseph, elected king of the Romans in 1761, she associated, after the death of her husband (1765), with herself in the government of her hereditary states, but in reality committed to him the charge only of military affairs. She joined with Russia and Prussia in the first partition of Poland, and in the second both Bavaria and Austria were added to her dominions. She also obtained from the Porte Bukowina (1777). On the death of the childless Elector of Bavaria Austria successfully asserted her claim to the crown over that land and other districts. Maria Theresa died 29th November 1780. Personally a woman of majestic and winning appearance, she was animated by truly regal sentiments and an undaunted spirit; and by this rare union of feminine tact with masculine energy and restless activity, she not only won the affection and even enthusiastic admiration of her subjects, but she raised Austria from a most wretched condition to a position of assured power. Her reign marks the transition of Austria from a medieval to a modern state; and by her efforts the beginning was made towards the emancipation from the heterogeneous lands ruled over by the House of Hapsburg. Although a zealous Roman Catholic, Maria Theresa maintained the rights of her own crown against the court of Rome, and endeavoured to prevent the encroachment of the papacy. In her church, of her ten surviving children, the eldest son, Joseph 1. succeeded her; Leopold, Grand-duke of Tuscany, followed his brother on the imperial throne as Leopold II.; Ferdinand became Duke of Modena; and Maria Antoniette was married to Louis XVI. of France. (See also Austria; by A. Wolf, 79, an Austrian version), other works by the same writer, by Duller, Raschhorn, and A. Wolf, the Maranzell, the most famous place of pilgrimage in Austria, situated in the extreme north of Sibin, 23 miles N. of Bruck and 60 SW. of Vienna. It is visited by thousands of pilgrims annually, besides numerous visitors attracted by its romantic scenery. The image of the Virgin (brought here in 1137), the object of the pilgrimages, is enshrined in a magnificent church, built in 1644 on the site of an older one. Pop. 1065. Four miles from the village are important ironworks. Guide by Fruhwiller (1882).

Maria Am'elie, queen of Louis-Philippe (q.v.).

Maria Antoniette, Josephine Jeanne, the most ill-fated among the queens of France, was born on the day of the great earthquake at Lisbon, 25 November 1755, the fourth daughter of Maria Theresa and the Emperor Francis I. From her cradle she was destined by her ambitions mother to be queen of France, and to that end was educated, although but indifferently, by the Abbé de Vermond. The marriage was negotiated by the Duc de Choiseul. The wedding took place on May 16, but was darkened a fortnight later by an ill-conceived panic during the great fête of fireworks given in its honour by the city of Paris, in which some hundreds of people perished. The beautiful young dauphiness soon found her position full of difficulties. Her husband, a stiff and undisciplined man, was repelled by her ambition and way of speaking; the old French court wearied her to death. A mere child in years, married to a dull, decorous, and heavy husband, who was, moreover, for some years indifferent to her person, she found relief in a capricious recklessness of conduct and a disregard for money and so from the commencement laid herself open to serious scandals for which there never was any real ground but her own indiscretion. She drive to Paris, her appearance at masked balls, her extravagance and undiscguised love for the court-table, and her open favour to handsome and profligate young men, were misread into shameless immoralitys, and she had lost her reputation long before she awoke to a sense of her responsibilities. In May 1774 the death of Louis XV. made her actual queen of France, and the Revolution soon fell on her and all the dislike of her subjects by her undisguised devotion to the interests of Austria, as well as her thoughtless opposition to all the measures devised by Targot and Necker for relieving the financial distress of the country. The miseries of France became the Instrument of the French Revolution on the extravagance of the queen, and in the miserable affair of the Diamond Necklace her guilt was at once taken for granted, not only by Paris but the whole country, and 'the Austrian' became the object of the frenzied hatred of a starving people. The act of accusation against Calonne was in the eyes of the mob that of the court of and the queen. Showers of virulent pamphlets rained from all sides, and 'Madame Deficit' and 'Madame Veto' were some of the names in which a maddened people shrieked their hatred against their sovereign. Meantime the joyous frieze of the palace was changed into the coarse and obscenity of the woman who made herself a centre of opposition to all new ideas, and prompted the poor vacillating king into a retrograde policy to his own undoing. She and Calonne were rising to the heroe— as Mirabeau once said, the one was the king that had about him was his wife. And she possessed the power of inspiring enthusiasm in all noble souls with whom she came into contact, as is evident from the personal influence she exercised over Porsen, Mirabeau, and Mirabeau. Amid the horrors of the march of women to Versailles (Octo-
MARIÉ DE MEDICI

of Marie Antoinette (1883); and for the affair of the Diamond Necklace, G. D'Annunzio and A. Niepce au CoUlier (1889). For an account of her portraits, supra 500 in number, see R. L. Ronald Gower's Iconographie de Marie Antoinette (Paris, 1883); and for the closing scenes in her life, the titles of Marie's last biographers: (vol. i.) and Marie Antoinette à la Concié- (1883), Lord Ronald Gower's Last Days of Marie Antoinette (1883), and L. de Saint-Amand, Les derniers (1885). Marie de France, the protess of whom so little is known with any degree of certainty, was that she lived in England under Henry III, and translated into French from an English version of a Latin translation of the Greek the Yoget, a collection of 103 moralised fables, in octosyllable verses, for the love of Comt William (supposed to be William Longways of Sandhur). These fables are natural and happy, as well as graceful in versification, and give their authors a place in that line of descent which ended with La Fontaine. But her greatest work was the twelve (or fourteen) Louis, oright, and generally poetic narrative poems, mostly amatory in character, in octosyllable verse, the longest nearly twelve hundred lines, the shortest just over a hundred. The word Lai is of Breton origin, and most probably referred originally to the style of music with which the harper accompanied his singing of the lays (Bla Gwemar, Equitun, Le Fraise, Biéret, Laut, Les Duat, Amaz, Ynone, Laustic, Milun, Chantil, Chierefoit, Eldane; and to these most add Grauent and L'Espina. Of the lays the best edition is that of Karl Warnke (Halle, 1883), forming vol. iii. of Suchier's Bibliotheca Normani, enriched with invaluable comparative notes by Reinhold Köhler. They were paraphrased rather than translated by the late Mr. O'Shanghnessy as Lays of France (1872). A third work sometimes ascribed to her is a collection of 2300 verses forming the purgatory of St. Patrick. The best edition of the lays and fables together is that of Roquefort (2 vols. 1820).

Marie de Medici, wife of Henry IV. of France, was the daughter of Francis I, Grand-duke of Tuscany, and was born at Florence, 26th April 1573. In the year 1590, she came to Henry, 16th December 1600, and in the following September gave birth to a son, afterwards Louis XIII. The union, however, did not prove happy. Marie was an obstinate and passionate woman, and her quarrels with the king soon became the talk of Paris. They quarrelled over her favourites, Leonce Galigai and her husband Con- cini, and was by them encouraged in her dislike to her husband. The murder of Henry (May 14, 1613) did not greatly grieve her, although it is not true that she was privy to the plot. For the next seven years she governed as regent, but proved as worthless a ruler, as she had been a wife. After the murder of Cominci (24th April 1617), whom she had created Marquis d'Ancre, a domestic revolution took place, and the young Louis XIII. assumed royal power. The queen was confined to her house, and her son refused to see her. Her pur- tains tried to bring about a civil war, but their attempts proved futile; and by the advice of Richelieu, then Bishop of Luçon, she made her submission to her son in 1619, and took her place at court. But it was not long supposed that she could not go to her party, but she soon found out that he had no mind to be ruled by her, whereupon she tried to undermine his influence with the king. Her in- intrigues for this purpose failed; she was imprisoned in the Luxembourg and was released in 1621. She went to Brussels in 1631. Her last years were spent in utter destitution, and she is said to have died in a hayloft at Cologne, 3d July 1642. She loved the

ber 5-6, 1789) she alone maintained her courage, and she showed herself on the balcony to the raging mob with a serene heroism that for a moment over- awed the fiercest into respect. That same day the royal family and the Assembly left Versailles for Paris amid the plaudits of all the rascaldom of both sexes within the walls. Marie Antoinette lacked consistency even in the part she essayed to play, and to the last she failed to understand the nature of the troublous times into which she had been flung. She had an instinctive abhorrence of conspiracy; she believed in the liberality of Lafayette and Mirabeau, and, if she professed to follow their example, she also distrusted other men, and refused to trust them altogether. Again the indecision of Louis and his dread of civil war hampered her plans, and the intrigues of the emigrés did her cause more harm than all her domestic enemies together.

The queen was at length prevailed on by Count de Mercy-Argenteau, at the instigation of Count de la Marck, to make terms with Mirabeau, and she gave the great tribune an interview at Saint-Cloud, July 3, 1789. But she was too self-willed and haughty to be made happy by this affair, for she abhorred his dream of a constitutional monarchy based on the free consent of an enfranchised people. His death in April 1791 re- moved the last hope of saving the monarchy, and less than three months later occurred the fatal flight to Varennes, from which she was repented at Varennes, against which Mirabeau had ever pleaded as a fatal step. The storming of the Tuileries and slaughter of the brave Swiss guards (10th August 1792), the transference to the Temple, the trial and execution of the king (21st January 1793), quickly followed, and ere long her son was torn from her arms, and she herself sent to the Conciégerie like a common criminal (21 August 1793). After eight weeks more of sickening insult and brutality, the "Widow Capet" was herself arraigned in her ragged dress and gray hair before the Revolu- tionary Tribunal. Under the torture of her trial she bore herself with the calm dignity and resignation of the martyr: one truthful touch stands out with infinite pathos across the century between two centuries: she was sometimes observed moving her finger with one sign, and her answers were short with the simplicity of truth: 'You persist, then, in denial?'—'My plan is not denial: it is the truth I have said, and I persist in that.' One charge unspeakable in its injustice was preferred by Hébert, which he had got her wretched son to sign. Under the mother can make no answer to such questions; I appeal to every mother—here present,' was her only reply. A deep murmur ran through the court— 'Miserable fool,' said Robespierre, 'he will make our enemies objects of compassion.' After two days and nights of questioning came the inevitable sentence, and on the same day, October 16, 1793, she left the world and all its madness behind her, under the axe of the guillotine. It was just three- and twenty years since she had left Vienna amid universal grief, in all the brightness of beauty and hope.

See the Histories of the French Revolution by Thiers, Mignet, Michelet, Louis Blanc, Carlyle, Von Sybel, and H. Morse Stephens poxition; also Madame Camban's Mémoires sur la vie et les temps de Marie Antoinette (1829); De Laserne's La vraie Marie Antoinette (1833); D'Huidelain's Correspondance inédite de Marie Antoinette (1864); Feniilles des Conches' Louis XVI., Marie Antoinette, et Madame Elisabeth, Lettres et Documents inédites (1865); Arneth and Geoffroy, Marie Antoinette; Correspondance inédite entre Marie-Thérèse et le Comte de Mirabeau (1874); the elaborate studies by M. P. de Neufville (1889) and M. de La Rochefoucauld (1889; trans. 1893); works by Anna Bicknell (1888) and Clara Tschudi (1888); M. C. Bishop, The Prison Life
Marie Galante, a French island in the West Indies, discovered in 1658 by Columbus in 1493, lies 17 miles S.E. of Trinidad. Area, 98 sq. m. It is covered for the most part with wood, and surrounded by coral reefs. Sugar, coffee, cocoa, and cotton are exported. Pop. 15,000.

Chief town, Grandbourg; or Marigot, on the south-west coast.

Marigotbad, one of the most frequented of the Bougainvillea, is a tall N.W. of Pilsen, at an elevation of 2667 feet above sea-level. The springs have long been used by the people of the vicinity, but it is only since 1867–8 that it has become a place of resort for persons from distant parts of the world. The springs are numerous, varying in temperature from 48° to 54° F. They are saline, containing sulphate of soda and various alkaline ingredients, but differing considerably in their composition and qualities. They are used both internally and in the form of baths. Great quantities of water are drawn to supply springs exported to distant places. Marigotbad is surrounded by wooded hills, has a population of 2000, and is visited every season by upwards of 14,000 patients. See Fraser Rae's Austrotian Health Resorts (1888).

Marileneberg, a mining town of Saxony, 33 m. south of Dresden. Pop. 6139.

Marileneberg, an old town of Prussia, on the Nogat, 20 miles by rail S.S.E. of Danzig. It was long the seat of the Grand Masters of the Teutonic Order (q.v.), who removed from Venice in 1309. The fortress of the Knights, however, was founded here about 1274. Marileneberg remained in their hands till 1347, when it was given by the Poles, and by them it was held till 1772. The castle, in which seventeen Grand Masters resided, a noble edifice in a style of Gothic peculiar to the vicinity of the Baltic, was thoroughly restored in 1817–22. Pop. (1875) 8392; (1892) 10,738. See works of Witt (1854) and Bergan (1871).

Marileneuber, a town of West Prussia, is picturesquely situated 3 miles E. of the Vistula and 55 by rail S. of Danzig. It was founded in 1233 by the Teutonic Knights, and has an old castle and a domkirche (1384). Pop. (1890) 8392.

Marilena, capital of Washington county, Ohio, on the 3 miles S.E. of Columbus. Founded in 1788, it is the oldest town on the site of which is the seat of Marietta College (1833), and has varied manufactures and a trade in the petroleum rich oil of near by. Nearby, Marilena has had many years of activity. Pop. (1890) 13,549.

Marilene Pasha, François Auguste Ferdi- nand, Egyptian explorer, was born at Boulogne, 11th February 1821, and was educated at the municipal college of the town. He became French master at a school at Stratford-on-Avon in 1830, and in 1840 a pattern-designer at Coventry. But he soon returned to Boulogne, and after taking his degree in 1844 was appointed professor at his native college. His connection with Nester l'Hôte, the companion of Chaplin, directed Marilena's attention to the hieroglyphic monuments; in 1849 he entered the Egyptian department of the Louvre, and in 1854 was despatched to Egypt in search of the Serapeum. On the 21st March 1857 he made his famous discovery of the Serapeum, the long-buried cemetery of the Apis bulls, and brought to light a host of important monuments and inscriptions in Memphis, Sakkarha, Gizeh, and the neighboring districts. He was appointed professor to the Egyptian government, and thenceforward his life was devoted to archaeological exploration in the Nile valley. With indefatigable industry he dug out the Sphinx and the temples of Dendera and Edfu, revealed the marble sculptures of Mygdon and Gizeh, and the courts and inscriptions of Medinet Habub, Deyr-el-Harir, Karnak, and Abydos, and began the excavation of Tut, since arranged by the Egypt Exploration Fund. But was he less active with pen and pencil. In 1856-57 appeared his Servietum et Memphis (also ed. Maspero, 1882); four editions of his Anegray de l'Histoire d'Egypte came out between 1864 and 1874, and six of the Catalogue des Musée de Denderah (which he founded in 1863, and which is full of the results of his labours) from 1864 to 1876; he published sumptuous descriptions in many volumes, with folio plates of the chief temples—Denderah (1870-73), Abydos (1869-80), Karnak (1875), Deir-el-Bahari (1877), Monuments Divers (1872, 73); while his Histoire de la Haute Egypte has been translated by his brother (Monuments of Upper Egypt, 1877), and his Mabulas edited by Maspero (1882). Besides the Denderah (now Gizeh) Museum, which owes its existence to its first director, Marilena founded the French School of Egyptology and the Egyptian Institute. He was raised to the rank of a pasha in 1870; he died at Cairo, 19th January 1881, and was buried in the garden of his museum.

See E. Deseille, Aug. Marilene (1882); H. A. Wallen, Notier, Ins. de France (1883); A. B. Edwards, Academy (January 1880).

Marignano. See MELEGGANO.

Marigold, a name given to certain plants of the natural order Composite, chiefly of the genera Calendula and Tagetes. Pot Marigold (Calendula officinalis) is an annual, a native of France and the more southern parts of Europe, with an erect stem, 1 to 3 ft. high, with lower leaves, long stalks, and large, deep yellow flowers. It has long been very common in British gardens; there are varieties with double flowers. The whole plant has a slight aromatic odour and a bitter taste. It was formerly in great repute as a carminative, and was regarded also as an aperient and sudorific. The florets were the part used, and they were dried in autumn to be preserved for use. They are often employed to adulterate saffron, and sometimes for colouring cheese. They were formerly a frequent ingredient in soups, and are still so used in the poor parts of England. The genus Tagetes consists of annual and perennial herbaceous plants, natives of the warmer parts of America, although T. erecta, one of those most frequently cultivated in Britain, bears the name of African Marigold; and T. patula, another annual well known in British flower-borders, is called French Marigold. Both species are Mexican. They have been long in cultivation, are much admired, and require the assistance of a hothed in spring in the colder parts of Britain. Corn Marigold is a Chrysanthemum (q.v.) and Marsh Marigold (q.v.) has no botanical affinity with the true Marigold.

Marine Engine. See STEAM-ENGINE.

Marines, or the Royal Marine Forces, are that body of the military forces of the crown which is under the control of the Admiralty, for service in the navy. They were first raised in 1664, the original aim, since modified, being to form a naval service to obtain seamen to man the fleet. The principle is still the same, although it is now to secure from out of the merchant fleet sufficient seamen for the public service; and, as those obtained by the system of impress were not easily amenable to discipline, the presence of some marines as disciplined troops had to be relied on to check or support the fleet when dependence was not necessary. The force is now composed of two branches, with separate lists for the promotion of officers, styled respec-
the Royal Marine Artillery and the Royal Marine Light Infantry. The artillery consists of one division, called the army, and they wear a Portsmouth uniform; the uniform, blue with red facings, is almost identical with that of the land artillery. The infantry consists of three divisions, quartered at Portsmouth, Plymouth, and Chatham; their uniform, scarlet with blue facings, is much the same as the lorimers. The marine infantry are formed according to seniority with officers of like rank in the army, and are promoted by seniority up to the rank of major, beyond which promotion is governed by selection. The strength of the marine forces is now about 14,000. When serving on board ship they are sentries and keep regular watch like the blue-jackets when not on guard, assisting in all the duties of the ship, except going aloft; in action both the men of the marine artillery and of the light infantry are now stationed at the guns conjointly with the blue-jackets, those not employed at the guns being used as a rifle party on deck; they always form part of all naval brigades landed for service on shore. With a view to their efficient training in gunnery, batteries with heavy guns mounted as on board ship have been established at the various garrisons, where marines are regularly drilled by qualified officers and instructors. All the marine artillery officers have to undergo a special course of training; and since 1887 probationary lieutenants for the light infantry have to pass through a course at Greenwich similar to that of the cavalry and artillery, and after joining headquarters undergo a course of instruction in gunnery. Combining the hardihood of the sailor with the training of the soldier, the marines are justly regarded as a most valuable body of men. Their officers can be called upon to sit at the wheel and to perform all general garrison duties, such as field-officer of the day, &c.; but they mount no garrison guards, and, although they may be called upon by the general in command to take part in field-days and reviews, yet, being outside the line and not of the Artillery, they occupy a position quite distinct from the regular troops in garrison with them. Marines, like blue-jackets, have the privilege, which the army does not enjoy, of wearing their beards, in barrack uniform as well as when afoot; and, like the blue-jackets, but without the small,Mt, they receive the same pay and allowances as the line service corps. Under the short-service system, which obtains in the army, it would be impossible to give marines the necessary training; they are therefore engaged to serve for fourteen years, with the option of re-engaging for another seven years, when they obtain a pension. The result of this is that the Admiralty can always obtain an unlimited supply of recruits; they are thus able to carefully pick their men, and their standard is much higher than that of the line. For physique, soldierly training, and efficiency no regiment in the army, not even the Guards, can approach the Marine Light Infantry. The marine artillery are even more a picked corps than their brothers of the light infantry, and they require a higher educational standard; it is admitted that no other army in the world produces such a perfect and magnificent body of men as the Marine Artillery Division. One of their battalions in line covers a third more ground than a corresponding line battalion. The bands of the Marine Artillery and Infantry Divisions are among the best military bands in the kingdom, being only on par with the magnificent body of the Guards. The Marine Light Infantry takes precedence in the army immediately after the 50th regiment of foot.

The original number of marines was 1200. The third regiment of the line was called the Maritime Regiment, also the Admiral's Regiment. In 1702 the force of marines had increased to six regiments; from 1714 to 1739 no marine force existed; in the latter year it was reconstituted as the 15th regiment, and in 1741 numbered ten. Once more disbanded in 1748, it was in 1755 placed wholly under the Admiralty. Subsequently, however, on the sudden expansion of the fleet for the wars with France, several line regiments were at times called upon to serve as marines. The former system was abolished, and presented in the bomb-vessels, and were so serving in 1804, when their duties were taken over by the Royal Marine Artillery, then first formed. This branch, more than once disbanded since then, was absorbed in the Admiralty. Of the time, and even since 1870 again threatened with disbandment, is now recognised as a cheap, reliable, and most valuable reserve of specially-trained gunners. In the United States the marines serve five years, receiving $13 a month; if they serve beyond the five years they are paid $18 a month. See Nicol's book (1845); and Edge, The Historical Records of the Royal Marines (vol. i. 1893).

Marini, Giambattista, an Italian poet, born at Naples in 1669. Abandoning jurisprudence for poetry under his father's will, he was befriended by various noble patrons, and recommended to Cardinal Pirli Agliardi and to the Excelsior of Italy, and died at Naples in 1625. The levicentiousness that mars his verse was but an echo of his life. His imitators form the so-called Marini school, of which the essential features are florid hyperbole and false overstrained imagery. See Giovanni Battista Marini.

Marino, a town on the Alban Hills, 12 miles SE. of Rome, has a castle belonging to the Colonna, who took it from its rivals, the Orsini, in 1424, and a cathedral and churches with pictures by Guido, Domencichino, and Guercino. It grows wine and manufactures soap, leather, &c. Pop. 9671.

Mario di Giuseppe, the famous tenor, was by birth the Canzoidi di Candia and son of General di Candia. He was born at Casilini in 1808 (not at Genoa or Turin in 1812), and served in the army for some years. But a youthful escape led to his forsaking Italy for Paris, where he quickly won his way into the most exclusive circles. The charm of his manners and his exquisite voice. Having contracted debts, however, he accepted the appointment of first tenor of the Opéra, with a salary of 1500 francs per month, changing his name at the same time from De Candia to Mario. After his death the Conservatoire Mario made his début, on the 21 December 1888, as Robert in Robert le Diable, and achieved the first of a long series of operatic triumphs in Paris, London, St Petersburg, and America. His répertoire embraced all the great works of Rossini, Donizetti, and Verdi. By the famous singer Giulia Grisi (q.v.) he was the father of six daughters. In private he was esteemed for his large-handed liberality and for his noble assistance to struggling artists. In his later years after his retirement from the stage he lost his famous tenor by disastrous speculations. In May 1878 a benefit concert in London yielded him as much as £1000. He died at Rome, 11th December 1883. See Engel's Musical Celebraties (1886).

Marianity. See Marty.

Marion, capital of Marion county, Ohio, 46 miles N. of Columbus, with manufactures of machinery, farming implements, and wooden wares. Pop. (1900) 11,892.
Marionettes, little jointed puppets of wood or cardboard, representing men, women, and animals, and moved by means of cords or springs by a concealed agent. They are exhibited in what are called marionette theatres, the exhibitor varying his voice, so that a sort of dramatic performance is accomplished. This entertainment was known to the Greeks, and from them passed to the Romans. In modern times it has chiefly prevailed in Italy, where it was known as Pantocino, and has reached a very respectable degree of artistic perfection. It was carried to France under Charles IX. by an Italian named Marion, whence it passed quickly to England, where it became known as a motion, or motion of puppets, or puppets only. The first marionette theatre, the exhibitor varying his voice, seems to have been Bartholomew Fair, and in Elizabethan times they appear to have played set pieces. We find allusions so frequent as to prove wide popularity in Shakespeare, Ben Jonson, Pepys's Diary, Pope, Swift, and the Essayists. Marionettes are still exhibited occasionally, but the only very familiar marionette-play we have is the Punch and Judy of our streets. A marionette Feast had for many generations been played in Germany, and Goethe tells us that it gave him the first suggestion of his greatest work. In the East the puppet plays, the marionettes being the striking fact that Gypsies still show marionettes in Germany, and already are spoken of as actors in Scotland in the 16th century.

Martial, Edme, a French physicist, born in Burgundy during the first half of the 17th century—the year is not known—was prior of St. Martin's Bouseau, and died at Paris, 12th May 1634. He was one of the earliest members of the Academy of Sciences at Paris, and wrote original papers on percussion, the nature of air and its pressure, the movements of fluid bodies and of pendulums, on colours, &c. What is on the Continent called Marieott's Law is rather Boyle's Law, and is an empirical law stated by Boyle (q.v.) in his Defence of the Doctrine touching the Spring and Weight of the Air (1662), and by Mariotte in his Discours sur la Nature de l'Air (1678). See GAS AND GASES. Mariotte's Works were published in 1682, and were read in London, 1712, and at The Hague (2 vols.) in 1749.

Mariposa, a central county of California, bordering on the Sierra Nevada. It contains the Yosemite Valley (q.v.), besides a grove of giant trees (see Sequoia). Area, 1,510 sq. m.; pop. 4720.

Maris, Jacob (1837-69), born at the Hague, sketched rises in Paris, and published a number of the greatest modern Dutch painters of landscape and genre. Only less famous is his brother Matthias (born 1833; settled in London), a genre-painter; and a younger brother Willem is a landscapist.

Marischal. See MARSHAL, Keith.

Marists, a modern French Catholic Congregation (q.v.). The Marist Fathers date from 1815; the Marist Brothers from 1817; and the Marist Sisters from 1834.

Maritime Province (Primesairs), part of eastern Siberia, extending along the Pacific coast from the frontier of Corea to the Arctic Ocean, and including Kamchatka and Sakhalien. It has a length of 2800 miles, a very varying breadth, and the general depth of the sea is from 1500 to 5000 fathoms (more than 3 miles) and 5000 miles in extent. The climate and productions are of course great. See AMUR, SIBERIA, KAMCHATKA, SAGHALIEN. The Maritime and Amur provinces are under one governor-general, whose headquarters are at Khabarovo.

Maritza (anc. Hébuas), a river of European Turkey, rises in the Balkans, and flows E. by S. past Philippopolis to Adrianople, where it bends and flows S. by W. to the Gulf of Enez in the Aegean. It is 270 miles long, and is navigable for small boats to Adrianople.

Maripol, or Mariampol, the seaport for the south Russian coalfield, stands on the Sea of Azow, 65 miles W. of Taganrog. It was founded in 1769 by Czarina Elizabeth from the Crimean exports coal, wheat, linseed, &c. to the annual value of £435,000. Fish-curing, soap-boiling, and tanning are carried on. Pop. 18,607.

Marius, Calus, a famous Roman general who was seven times consul, was born of an obscure family at the village of Cerasae, near Arpinum, 157 B.C. He served with great distinction at the siege of Numantia (134) until the young Roman Africanus, who is said to have hinted that in him the Romans would find a successor to himself. In 119 he was elected tribune of the plebe, and already he had made himself a great popular leader by his vigorous opposition to the nobles. In 114 he went to Spain as proconsul, and cleared the country of the rubbers who infested it. He now married Julia, the sister of the father of the great Caesar. He served in Africa as legate to Q. Cecillius Metellus during the war against Jugurtha, and was elected consul two years after. He took for these provinces of Numidia, and closed the Jugurthine War in the beginning of 106. The honour of capturing the beaten king fell to his quaestor L. Sulla, and from this period dates the birth of that jealousy out of which were to flow so many horrors. Meanwhile, an immense horde of the Cimbri, Teutones, and other northern barbarians had burst into Gaul, and repeatedly defeated the Roman forces with great slaughter. Marius was again called to the consulate for the year 104, and for the third, fourth, and fifth time in the following years, 103-101, for the last was felt that he always brought home victory. The war against the Teutones in Transalpinum Gaul occupied him for more than two years; but he finally annihilated them in a terrible battle of two days' duration at Aquae Sextiae, now Aix, in Provence, where 200,000—according to others, 300,000—Teutones were slain. Marius went to Britain. He returned to the Cimbri in the north of Italy, and them he also overthrew at Campi Raddi near Verceil, with a like destruction (101). The people of Rome knew no bounds to their joy. Marius was declared the saviour of the state, the third founder of Rome, and was made consul for the sixth time in 106. It has often been remarked that, had he died at this period, he would have left behind him one of the greatest reputations in Roman history. But to perpetuate his power he stooped to the basest arts of the unprincipled demagogue.

When Sulla as consul was entrusted with the conduct of the Mithridatic war, Marius, who had long manifested an insane jealousy of his patrician rival, attempted to deprive him of the command, and a civil war (184-79) ensued. Marius was soon forced to flee, and, after the most frightful hardships, and numerous hairbreadth escapes, he made his way to Africa. Two romantic incidents stand out among these days of peril. His place of hiding in the marshes of Liris had been discovered, and Sulla had been within an hour of his prison at Minturnae, when a Cimbrine slave was sent to despatch him, 'Wretch, dares thy soul slay Caius Marius?' said the old hero as he glared upon him out of the gloom. 'Slave fled in terror crying, 'To slay a good Marius,' and the citizens recognising the order allowed him to escape. Scarcely had he reached the shore of Africa, when the Roman governor sent him a summons to leave the country. Said Marius, 'Go, tell the pretor that you have seen Caius Marius a
fugitive, sitting on the ruins of Carthage.' Here he remained until a rising of his friends took place under Cinna. He then hurried back to Italy, and, along with Cinna, marched against Rome, which was obliged to yield. Marius was delirious in his revenge upon the aristocracy; a band of 4000 slaves carried on the work of murder for five days and nights. Marius and Cinna went about together for the year 86, but the former died after he had held the office seventeen days. On the triumph of Sulla his body, which had been buried, not burned, was torn from its grave on the banks of the Anio, and cast into the stream. Lucan tells us how the troubled ghost haunted the country, scattered the peasants from the plough on the eve of impending revolutions.

**MARIVAUX, PIERRE CARLET DE CHAMBLAIN DE**, was born at Paris, February 4, 1688. He belonged to a good Norman family and devoted himself to letters. He received but a slight education and in his early writings asserted a disdain of the Greek and Latin authors, declaring, in fact, that he preferred Gregory of Tours to Tacitus and Vincent Ferrier to Demosthenes. He published, _L'Homme Traversi_, a burlesque of the Head, in 1716, and brought out his best comedy, _Le Jon de l'Amour et du Hasard_ in 1722. He received a pension from Helvétius, and another, of 1000 crowns a year, from Madame de Pompadour. His romance of _Marivanne_ came out in 11 parts between 1731 and 1741, but was never concluded by him, the twelfth part being added by Madame Riccoboni. He followed up his first dramatic successes by numerous comedies: _L'Epreuve, Les Fauxasses Confidences, Le Lys, Les Sirenes, La Mérise, Le Triomphe de l'Amour, _&c. They are the work of a clever analyst rather than a dramatist; the dialogue, says Sainte-Beuve, is a perpetual 'moral skirmish;' the writer sacrifices character and situation to an ingenious playing with words. Marivaux, said Voltaire, knew all the bypaths in the human heart, but he did not know the highway. He died at Paris, February 12, 1763. His title to fame rests on _Marivanne_, one of the best novels of the 18th century. Its interest does not lie in exciting adventures, but in the subtle analysis of character and the delicate picturing of contemporary manners. From the English and German renditions of Marius's finicking style the term _Mariavudage_ was at one time current as a synonym for affected or 'precious' writing. His other romances, _Thermidor_ and _Le Payan parvenu_, are greatly inferior to _Marivanne_. See Sainte-Beuve's _Converses_ (1790). From the recueil, _Marivanne_ (1794) and _Arsène Houssaye's_ _Galerie du dix-neuvième Siècle_.

**Marjoram** ( _Origanum vulgare_ ), a perennial, a plant of the natural order Labiatae. Several of the species are familiar as pot and sweet herbs in gardens. _O. vulgare_ is the Common Marjoram, a native of Britain, and is aromatic with a bitter and slightly acrid taste. The dry leaves have been used instead of tea, and they are also used in medicinal potions. The tops of the plant have been used to dye woollen cloth purple; and, by a process of macerating the material first in alum water and then in a decoction of crab-tree bark, they also dye cotton cloth a reddish brown. Oil has been obtained from this and other species by distillation. The oil of marjoram is so caustic as to be used by farmers as a stimulating liniment. A little cotton moistened with it placed in the hollow of an aching tooth relieves pain. _O. sericeum_ is the Winter Sweet Marjoram, _O. hortensis_ is the Summer Marjoram; and the Knotted Marjoram is _O. Marjorana_. The dittany of Crete, a plant with round leaves clothed with thick white down and purple trailing stems, which is frequently cultivated as a window-plant in Britain, is _O. Dictamnus_.

**Mark**, the standard weight of the money system in various countries, especially in Germany, where in the middle of the 11th century the Cologne mark = half a Cologne pound, or 253.512 gr. The mark was adopted as the standard, and as such continued in use till 1857. The mark gradually acquired a monetary value as well; as such it has been used ever since 1857 as the standard of currency in the German empire, being equivalent to $3.51 of a pound. It consists of fine gold, and equal to 11.34 English and 24 cents United States currency. But there are only 5, 10, and 20 mark pieces in gold. The silver mark ( = 4 thaler) is divided into 100 pfennigs. The Liebeck mark or mark current, a coin formerly in use at Hamburg, was worth 1s. 2d.; the mark house there, a money of account, was worth 1s. 6d. In England marks are first heard of in the treaty between Alfred and Guthrum the Dane, and are supposed to have been introduced as a Danish recoinage. But these marks were not coins, only money of account, or rather a weight. In 1194 the coinage of marks had the nominal value it ever held retained, 100 pfennigs or 13s. 4d., two-thirds of the nominal pound. The gold noble, first struck by Edward III., was worth half a mark—0s. 6d. As late as 1706 Defoe fined 200 marks. In Scotland the mark or _merk_ was a weight for gold and silver, or common money recoinage, and also a coin. The coin, like the other Scotch coins, had only one-twelfth of the English value: nominally 13s. 4d., it was worth only 1s. 6d. The mark shilling or _merk_ was the one-merk (4⁄12 oz.) of the half, and quarter mark pieces. The French standard weight mark weighed 244.75 gr. and the Dutch mark 246.05 gr. marks.

**Mark**, a signature. See DEED, ILLITERATES.

**Mark**, also called JOHN (Acts, xiii. 5, 12; iii. 13, 19) or, more fully, 'John, whose surname was Mark' (Acts, xii. 25, 26), is named by unvarying tradition from the close of the 2d century as the author of the second canonical gospel. Of Mary, his mother, nothing is known except that her house in Jerusalem was visited by Peter and the other disciples. Barnabas the Levite was his cousin (Col. iv. 10. 11). By some Mark has been supposed to be the young man mentioned in Mark, xiv. 51, 52, and it has also been conjectured that Mary's house may have been the place where the Lord's Supper was instituted. Mark seems to have been Paul's first missionary journey from Antioch in Syria as far as to Perga in Pamphylia (Acts, xii. 25; xiii. 13); here he quitted them on grounds which, whatever they may have been, did not approve themselves to Paul, who at a later date peremptorily declined to receive one of his converts (Gal. vi. 3). Even though this involved his parting company with Barnabas also. That a reconciliation afterwards
to be unlikely in course of borrowing the more vulgar style of expression should be substituted for the more polite. Again, the graphic, vivid, and abrupt style of Mark (characterized by use of the historical present and by other features) is not that of a mere abridger or copyist. Further, the program of the earlier narrative, the evangelists from that in Matthew and in Luke, is now held to represent, probably, the actual order of the facts more nearly. The natural course of a gradual development in the life and work of Jesus, in his own self-consciousness, and in the estimation of others, but had no design of giving Mark anything of the other gospels. The manner and degree in which the supernatural element is presented are also held to betoken the earlier narrative. Certain expressions too, which might be supposed stumbling to faith, are present in Mark, but absent from the others, having either been stricken out altogether or modified so as to bring them more into accordance with accepted views. (Compare, e.g., Mark, vi. 5 with Matt. xiii. 58; also Mark, i. 32-34 with Matt. viii. 16 and Luke, iv. 40, 41.) In short, its naive, directness, and simplicity prove the comparative simplicity and later, regarding Mark, see Moulins, De Véa et Lépinay's, Marc Evangéliste (Rome, 1884). The Gospel According to Mark.—Two distinct accounts of the origin of this gospel, both of them developments from earlier tradition, were formulated respectively by Augustine and by Jerome; both gained general currency throughout the Western Church. Various New Testament books have been attributed to him by individual modern critics (Eustice to Hebrews, Epistle of Jude, and, more recently, the Apocalypse, in whole or in part). For the traditions, both earlier and later, regarding Mark, see Moulins, De Véa et Lépinay's, Marc Evangéliste (Rome, 1884). MARK ANTONY

its ideal and figurative elements and its deepest religious meanings. That such was the case with his early companion John at least is a theory that has found considerable acceptability with Christian apologists. See John (Gospel according to). But even so, there are passages in Mark in which the same words and phraseology are used vaguely as to make it difficult to believe that they were written by the authority of an eye-witness only once removed. This is confessedly the case with Mark, xvi. 9-20, and partly also with the history of the closing days in Jerusalem, though even this abounds with many picturesque touches in xvi. 11-15. Intimate acquaintance with the text, in which the exegesis feels constrained to suppose some discoloration or derangement of a context, or misunderstanding, perhaps mistranslation, of a saying. See, in particular, chap. xiii.

The general conclusion of the critical discussion is that in the second gospel on the whole we hear the language of a reporter who had often listened to one who claimed to have been present at the scenes he described. The weight of traditional as well as of internal evidence goes to show that it was written in Rome about 70 A.D., perhaps rather than before that date. From what he had heard in Petrine circles, the author doubtless felt himself at liberty to make use of whatever he may have gleaned elsewhere from what he deemed trustworthy sources for the Galilean and Jerusalem traditions. He has been more than once questioned whether he may not actually have seen the facts, read, or heard, in whole or in part, the "logia" of Matthew. That the second gospel was used by the authors both of the first and of the third may be regarded as now more or less certain. On the assumption that the "logia" of Matthew contained absolutely new virgin material, it used to be argued that the second gospel must originally have been somewhat fuller than it now is ("original Mark, 'Ur-Marcens'). But this theory is now very generally given up. A more likely supposition is that the original form was shorter than the present Mark, xvi. 9-20, is confessedly late. It is not improbable that the preface, i. 1-3, was at one time absent. Some have thought that vii. 24-viii. 26 did not occur in the copy of Mark used by Luke. Reuss has long held that the original Mark contained only of L. 21-r. 48 and vii. 27-xii. 37. It is not unlikely that editorial insertions and alterations have been made throughout. Critical investigation into the genesis of the synoptic gospels, though far advanced, has yet to be said to have reached completion, and there is good reason to suppose that this examination may yet succeed in reaching still more definite results.

See the works enumerated under Gospels, especially the introductions of Holtzmann and Weiss, and also the commentaries by these authors (Weiss, 7th ed. of Meyer, 1875; Holtzmann, 1881). Compare also P. Ewald, Das Hauptproblem der Evangelienfrage (1890). The English text of Mark is printed, and its relations to Matthew and Luke graphically exhibited, in Abbott and Rushbrooke's Critical Text of the Synoptics (1884). A suggestive reconstruction of the supposed first section of Mark is given in Soiger's Ueverturem (1890).

MARK ANTONY. See ANTONIUS (MARCUS).

MARKET-DRAYTON, or DRAYTON-IN-HALES, a town of Shropshire, on the Tern, 18 miles N.E. of Shrewsbury. It has a grammar-school (1554) and a market-day (Thursday). Its most famous son was whose Clive (q.v.) clambered as a boy at Shrewsbury, 3 miles to the east, the Yorkists won a victory in 1459. Pop. of parish, 5188. See two works by J. R. Lee (1861) and T. P. Marshall (1865).

MARKET-HARBOROUGH, a market-town of Leicestershire, on the river Welland and the Union Canal, 16 miles S.E. of Leicester, 18 N. of Northampton, and 84 N.W. of London. It has traces of a Roman camp; a fine Perpendicular church, built in 1463; the house of John of Gaunt as an atonement for his intrigue with Catherine of Aragon, with a horst spire 154 feet high; a corn exchange (1858); and a grammar-school (1014; restored 1869). Charles I. slept here before Naseby. Situated in a rich hunting country, it is a famous hunting-centre, and gives title to one of Whyte-Melville's horse's (Pop. (1851) 2325; (1881) 5351; (1891) 5876. See works by John H. Hill (Leicester, 1875) and J. E. Stocks (Lond. 1890).

MARKHAM, Sir Clements Robert, F.R.S., and since 1890 K.C.B., geographer, is a son of the Rev. D. Markham, canon of Windsor. He was born 1830 at Stillington, near York, educated at Westminster, from which school he entered the navy in 1844. Immediately on passing lieutenant in 1851 he left the navy, and in 1855 became a clerk in the Board of Control. In 1863 he was elected secretary to the Royal Geographical Society, and in 1867 became assistant-secretary in the India Office. In 1868 he was placed in charge of the geographical department in that office. He served in the Arctic expedition (1850-51) in search of Sir John Franklin. He explored (1852-54) Peru and the forests of the Eastern Andes; he introduced (1860) the cultivation of the cinchona plant from South America into India as a possible substitute for quinine. He was a notable geographer (1867-98) in the Abyssinian expedition, and was the naturalist accompanying of Maghala. Of his numerous publications, which include many translations from the Spanish, and several antiquarian and genealogical works, mention can only here be made of his Grammar and Dietetic of the Yahoos (1869); The Threshold of the Unknown Region (1874; 4 eds.); The War between Chili and Peru (1879; 3 eds.); Missions to Thibet (1877; 2 eds.); his Reports on the Moral and Physical Progress of India for 1871-73; and his Life of John Davis, in the "Explorers" series (1888). He edited the Geographical Magazine from 1874 to 1875.

MARKING INK. See INK.

MARKIRCH (Fr. Ste-Marie-aux-Mines), a town of Upper Alsace, on the Leber, 40 miles SW. of Strasbourg, by rail, with important cotton and woolen mills. Pop. (1890) 11,870.

MARL, a mixture, naturally existing, of clay and carbonate of lime. Marl are found in very different geological formations, but nowhere seem to occur in their original state. The name is sometimes applied to friable clays, or mixtures of clay and sand, in which there is almost no trace of lime; but the presence of a notable proportion of carbonate of lime is essential to marl, properly so called. This proportion varies from 6 to 20 per cent. Marl soils are in general of great natural fertility. Marl is very advantageously used as a manure, acting both chemically and mechanically; but different kinds of marl are of very different value in this respect. The use of marl as a manure began in England in early times. An English statute of 1225 (10 Hen. III) gave every man a right to sink a marl-pit on his own ground, and there is other evidence that the application of marl to land was common in England in the 13th century. The quicker action and greater efficiency of lime having led to its use in many cases instead of marl, although some kinds of marl are extremely useful in some soils. The bulkiness of marl confines its use to the neighbourhood in which it is found. Marl is sometimes indurated into a rock; a slaty variety, containing much bitumen, is found in Germany. See also Lias.

MARLBOROUGH, an old and interesting market-town of Wiltshire, pleasantly situated in the valley
of the Kennet, near Savernake Forest, 75 miles W. of London and 11 S.S.E. of Swindon. Its broad High Street contains some picturesque houses, and at the east end is St Mary's Church, a Gothic hall of St Peter's with the college. Near the latter is a British mount, on which early in the 12th century Bishop Roger of Salisbury built a castle. This afterwards became a royal residence; and here in 1267 Henry III. held the parliament which enacted that the statutes of Marlborough for retaining good government after the barons' wars. An ancient municipal borough, Marlborough, till 1807, returned two members to parliament, and till 1832 one. Pop. (1831) 3460; (1891) 3012. Marlborough College was incorporated in 1843, and obtained an additional charter in 1853; the number of pupils is between 500 and 600, of whom about 70, sons of clergy, are on the foundation. There are some thirty scholarships worth from £15 to £30 annually, and fourteen leaving exhibitions for Oxford, Cambridge, and Woolwich. The nucleus of the college buildings was formerly a famous coaching-house; and their special glory is the new chapel, an Early Decorated nave with apsidal chancel, completed in 1886, at a cost of £30,000. See local histories by Waylen (1854) and Hallme (1891).

Marlborough, a provincial district of New Zealand, in the north-east corner of the South Island, 130 miles long by 30 broad; area, 3,000,000 acres, of which 200,000 suitable for pastoral occupation. Amongst the minerals are gold, antimony, copper, and coal. See NEW ZEALAND.

Marlborough, John Churchill, Duke of, the eldest general and diplomatist of his time, was born on the 24th June 1650, at Ashie, in Devonshire, an old manor-house, which can still be seen handsomely situated near Salcombe. As a young man, Sir Winston Churchill, had been an enthusiastic adherent of the Stuarts, and on the accession of Cromwell to power his estates had been consequently sequestrated. At Restoration, however, Winston recovered possession of his lands, but the poverty to which they reduced him he alleviated by the education of his children, which was conducted at an expense befitting their position, so that young Churchill and his brother George had to face the world with little Latin and less Greek, and a knowledge of English history gathered from the plays of Shakspeare. In 1672 the Duke, who was a page to the Duke of York, John was fortunate enough to secure a commission as ensign in the Guards, and at the age of sixteen, in the year 1667, he was sent to Tangiers, then besiegéd by the Moors. It is said that he was sent to Tangiers on account of the king's jealousy of his favours with the Duchess of Cleveland; and the story is told that on one occasion, being nearly surprised by the king, he leapt out of a window and was presented by the duchess with £5000, £4500 of which he invested in an annuity of £900, and the remainder he laid out in executions. Anne, Duchess of York, had little opportunity of distinguishing himself. Recalled to England by the Duke of York, he was promoted to a captaincy, and in command of a grenadier company he was dispatched to join Turenne at Blenheim, where he distinguished himself with the fortresses on the Dutch frontier. Here his brilliant courage and ability at once gained him a colonelcy, although his promotion would not have been so rapid had he not called into requisition the whole army, consisting of 10,000 men and 200 guns. The Duke of York, his master, was so much advanced by his marriage with Sarah Jennings, a lady as remarkable for her talents and imperious disposition as for her beauty. In 1682 he was created Baron Churchill of Eyemouth, in Scotland. On the accession of the Duke of York to the throne as James II., the services of Colonel Churchill to his master were not forgotten, as he was raised to the English peerage of Marquess of Normanby, to thelordship of Say in Hertfordshire. Promoted to be general, Churchill took an active part in quelling the rebellion of Monmouth; but, on the landing of the Prince of Orange, he stole away to the side of the invader, leaving a letter in which he endeavoured to explain away his treachery by saying that the only inviolable dictates of his conscience and a necessary concern for his religion could have induced him to desert his master. James's daughter, the Princess Anne, accompanied by Lady Churchill, also fled to join the rebels; and when, on his accession, William III. could not rid himself of a certain not altogether ungrounded suspicion of his new earl, till in 1692 he fell into disfavour, and was dismissed from all his offices. As the result of the discovery of a plot with which a clever forger named Young associated the name of Marlborough, the latter was enticed to London, and lodged in the Tower. In ten days he was released, however, but for five years he was without any public employment, till the death of Mary, when he was restored to the favour of the king, and he retained it till the death of William in 1702. When the accession of the Elector of Hanover to the throne of Great Britain was threatened with the command of the British army in the Netherlands on the declaration of the war of the Spanish succession, in which he was to show his unrivalled strategic genius during one of the most disastrous series of military operations in which England has ever been engaged. Anne showered honours on the head of the fortunate earl and his wife, her closest friend. Marlborough was made a knight of the Garter, Commander-in-chief, and Master General of the Ordnance, while his lady was appointed Groom of the Stool, Mistress of the Robes, and Keeper of the Privy Purse. Marlborough, in fact, became regent in all but name. His wife governed the queen, and he himself directed Godolphin, the Lord High Treasurer, whose son had married his daughter. At the opening of the campaign, Marlborough, on his arrival at The Hague, was named commander-in-chief of the combined English and Dutch forces, with a salary of £10,000. The campaign was one long series of triumphs for the allies. In 1702, for driving the French out of Spanish Guelders, the reward was a dukedom and £5000 per annum 'from the post-office.' The year 1703 was made memorable by the duke by the death of his only surviving son, the Marquis of Blandford, who succumbed to an attack of smallpox. Marlborough had little time to grieve over his loss, for he was sent by the cabinet to the Low Countries, in which he was so much disgusted with the Dutch that he returned to England, seriously thinking of throwing up his command. Next year, however, we see him supporting the Emperor in his war with Turkey, and joining Prince Eugene of Savoy, in July of the same year, forming, with the French and Bavarians, the combined army of the enemy. After a campaign of some years, he was sent to Paris, where he arrived in May 1708. Marlborough's army then numbered fully 12,000. The result of this decisive battle stamped Marlborough as the first general in Europe. Parliament bestowed upon him the estate of Woodstock, the crown caused Blenheim Park (q.v.) to be built for him, and the emperor
created him a prince of the Holy Roman Empire. Diplomatic negotiations occupied the principal part of Marlborough's time and attention in 1706, but in 1706 he resumed that career of victory which broke the force of the spell surrounding the great power of the French. He and for nearly a quarter of a century, ruling over a large number of his own officers, who re
tested the strength of the English, in which he indulged himself the 'Invincible.' On the 23d May 1706 the battle of Ramillies was fought, when the French were obliged to desert the line of the Scheldt and evacuate the whole of Spanish Flanders. The campaign of 1707 was an almost wholly inactive one, but in 1708 Marlborough was again called on to raise Vendée to recover Flanders led to the battle of Oudenarde—the only battle of Marlborough's engaged in front of a fortified town—fought on July 11, and resulting in the total defeat of the French force. Marlborough then laid siege to Lille and Ghent, and the surrender of these two towns ended the long and arduous campaign. The year 1709 was distinguished by the battle of Malplaquet—in Marlborough's words, 'a very murderous battle. The numbers were practically equal, but the French had an immense superiority in position. There are few battles in history of which it can so certainly be said that the best men won. The carnage was tremendous—20,000 on the side of the allies and 8000 on that of the French. The blood of Malplaquet—the last of the battles under Louis XIV., who gloried in calling his name a unique position in the roll of generals—did not bring about peace; and in 1711 he was again called on, taking town after town from the French. This eventually led to the treaty of Utrecht, which gave thirty years of peace to Europe.

Meanwhile important events were taking place in Britain. The queen, tired of the tyranny exercised by the Duchess of Marlborough, shook off the yoke, dismissed her ministers, Godolphin and Sunderland, and paved the way for the elevation to power of the Earl of Oxford and the Tories. Thereupon a charge was preferred against Marlborough of having embezzled public money, and he was deprived of his offices, till the accession of George I., when, in a day, he was restored to all the honours which he had lost at the hands of Blenheim. A stroke of apoplexy on 25th May 1716, although it impaired his speech, did not preclude his attendance in parliament till within six months of his death, which occurred on 16th June 1722. His funeral obsequies in Westminster Abbey were celebrated with great magnificence, and all ranks and all parties in the state joined in doing him honour. Charges of avarice and peculation have been brought against Marlborough—among others, by Hallam,Mahon, Macaulay, and Thackeray. Despite this, there is the certainty that he thought more of his own interest than the cause in which he was engaged, his character had many elements of excellence. He was generous in action, gentle in temper, a devoted husband, and a man of religious fervour.

Marlborough, the creator, was born on 29th May 1590, and when about twelve years of age entered the service of the Duchess of York, and became the chosen and most intimate friend of her step-daughter the Princess Anne. Like Marlborough himself, Sarah bore of an ancient but rising royalist family. Of the succession to the throne, the duchess exercised over the young queen the influence due to a superior and singularly active mind. Her power was almost boundless; the Whig ministry relied upon her support, and she disposed of the great and lewd army, which it was said to have accumulated money by the trans actions. Her fair fame, however, apart from this, was never, even in those days of securiflous lampoon, tarnished by the breath of scandal. Her rule, which lasted for a considerable time, at last became unbearable, and she was supplanted in the favour of the queen by her own cousin, Mrs Masham, whom she herself had introduced to court. She retired from the queen's service in January 1711, and for nearly a quarter of a century, ruling over a large number of her husband, living in complete retirement. She was of a very pugnacious disposition, only happy when quarrelling with her friends or engaged in lawsuits, such as those arising out of the completion of Blenheim. She died on 29th October 1744, leaving a few pecuniary memorial of which she bequeathed £10,000 to William Pitt. As the Marquis of Blandford, the only son of the Duke and Duchess of Marlborough, died young, the title was inherited by the descendants of one of their daughters, the Countess of Sunderland.

Marlinspike, an iron pin, with a large head and taper point, used on shipboard for separating the strands of rope preparatory to splicing or marling; also employed as a lever in tightening rigging; &c. See Knobs and Splices.

Marlitt, Eugenie, the pseudonym of E. John, a German novelist, born at Arnstadt in Thuringia, on 5th December 1817. He was a musician by profession, and musical talent gained her the favour of the Princess of Schwarzburg-Sondershausen, who sent her to Vienna, where, after three years of study, she appeared on the stage. But a successfully-begun career was cut short by an afflication of the ear, and Fräulein John acted as reader to her patroness till 1863. Retiring in that year into private life, she spent her time in writing romances, interesting enough, but with strong didactic tendencies and somewhat unreal. Of these the most successful was a novel (1836) called, in English translation, and by some of the critics, The Old Maid's Secret (1837), Princess of the Moor (1871), Second Wife (1873), Countess Gisela (1869), and Thuringian Stories (1869)—all except the last translated into English, 1870 to 1873—have also passed through many editions. She died at Arnstadt on 22d June 1887. A collected edition of her Romanezen und Novellen was issued in 5 vols. in 1889.

Marlow, Great, a town of Buckinghamshire, on the Thames, 20 miles W. of London by rail, has manufactures of lace and paper, an iron suspension bridge, a house where Shelley lived in 1817, and a grammar-school (formerly a blue-coat school). It sent two members to parliament down to 1807, and one till 1855. Pop. of parish (1891) 5283.

Marlowe, Christopher, Shakespeare's greatest predecessor in the English drama, a shoemaker's son, was baptised at Canterbury, 26th February 1563-64. From the King's School, Canterbury, he was sent to Benet College (now Corpus Christi), Cambridge; proceeded B.A., 1583, and commenced M.A. 1585. Early in life, after taking his bachelor's degree is not known. A ballad printed from MS. by J. P. Collier asserts that he was an actor at the Curtain Theatre, and 'brake his leg in one awe scene when in his early age,' and Mr. Cunningham suggests that he may have served as a soldier in the Low Countries.

The earliest of Marlowe's extant plays is Tamburlaine the Great, in two parts, first printed in 1599, and probably produced in 1593. It is about the career of a great conqueror, whose success is always superior to any tragedy that had yet appeared on the English stage. By his energy and fervour, his aspiring imagination and majestic utterance, he confounded his rivals and won immediate supremacy. Very
noticeable is the proud self-confidence displayed by the young poet in the prologue:

From juggling veins of rhymeless mother-wits,
And such conceits as clowndye keeps in play,
We’ll lead you to the statue
Where you shall hear the Seythian Tamburlaine
Threatening the world with a high astounding terror.

Earlier dramatists had employed blank verse, but it had been stiff and ungraceful: Marlowe was the first to discover its strength and wealth of rhythm. His popularity of Tamburlaine was extraordinary. A ludicrous line in the Seythian conqueror’s address to the captive monarchs whom he has harnessed to his chariot—‘Holla, ye panpered judges of Asia!’—was constantly parodied for half a century. Doubtless the extravagance of the play contributed to its success. The part of Tamburlaine was originally taken by the famous actor, Edward Alleyn, who afterwards personated Faustus and Barabas.

The Tragedy of Dr Faustus was probably produced soon after Tamburlaine. The earliest edition is dated 1604; in the edition of 1616 additional comic matter is inserted by an inferior hand, but it also appears to preserve some genuine passages that were dropped from the earlier edition. Faustus, as it has come down, is rather a series of detached scenes than a single drama; and some of them are evidently not by Marlowe. One playwright after another was employed to furnish ‘additions.’ But the nobler scenes are marvellously impressive; nowhere is Marlowe’s genius shown more vividly than in Faustus’s gentlemanly description of Helen’s beauty and in the terrible soliloquies that prepare us for the catastrophe. Faustus held the stage, and was revived at the Restoration. Edward Phillips, Milton’s nephew, quaintly remarks that ‘Of all that Marlowe hath written to the stage his Faustus hath made the greatest noise, with his devils and such like tragic sport.’ A German version was acted by English players at Gratz during the carnival in 1598, and at Dresden in 1626. Goethe expressed his admiration for Marlowe’s work.

The Jew of Malta, produced about 1590, is the masterpiece of Marlowe’s plays. It has not the magnificent poetry that we find in Faustus and in the first two acts of The Jew of Malat, but it is planned and executed with more firmness and solidity—in a more temperate and patient spirit. The various characters are skilfully discriminated, and the action is never allowed to flag. Many critics believe it to be Marlowe’s Richard II.; it is certainly no whit inferior. Charles Lamb declared that ‘the reluctant pangs of abdicating royalty in Edward furnished hints which Shakespeare scarce improved in his Richard II.; and the death-scene of Marlowe’s king moves pity minute penetration, ancient or modern, with which I am acquainted.

The Massacre at Paris is the weakest of Marlowe’s plays, and has descended in a mutilated state. It was written after the assassination of Henry II. (24 August 1589), and must be probably one of the latest productions of the poet. An early MS., a fragment of an original playhouse transcript, preserves part of scene six.; and a comparison of the MS. text with the text of the printed copy shows that the play was mangled in passing through the press.
he could hardly have left a better poem than Hero and Leander. Comedy he would never have attempted; he had no humor. In tragedy he prepared the way for Shakespeare, on whose early work his influence is firmly stamped.

Benzoni, an Italian Jesuit, whose works have not been superseded. It was issued in 1830, 3 vols., by Pickering; revised edition, 1 vol. 1858. Cunningham's edition (1 vol.) is useful but inaccurate. In 1855 the present writer brought out an edition (3 vols.). Marlowe's best plays are included in the 'Mermaid' series, ably edited by Mr Havelock Ellis. Dr Faustus has been elaborately edited by Professor A. W. Ward. In Germany M. H. Hermann, Breymann, and Albrecht Wagner have engaged in the careful reconstructing of the original orthography and exhaustive lists of variant readings. In 1888 it was resolved to erect a monument to Marlowe's memory on the Dane John, Canterbury. No authentic portrait is extant.

Marmalade (Port. marmelada, from mar, melo, 'a quince,' which, again, is from Mid. Lat. maltumellum, Gr. melimelon, 'honey-apple' or 'sweet orange') is a semi-liquid preserve, made by boiling the pulp of thick-rinded fruits, such as oranges, pears, tomatoes, etc., with a little sugar and water.

The most common kind of marmalade is made from the bitter or Seville oranges, the common or sweet sorts being considered inferior for this purpose, though also occasionally used. The woolly coating on the interior being removed, the rind is cut up into thin strips, and boiled along with the expressed juice of the pulp and a quantity of sugar equal in weight to the other ingredients. The preserve is now made on a commercial scale in factories at London, Dundee, Paisley, and elsewhere.

Marmion, Shackerley, minor dramatist, was born in His弥化i'ay, Lancashire, in 1624, and studied at Wadham College, Oxford, and took the degree of M.A. in 1624. He squandered his fortune, fought in the Low Countries, and joined Sir John Suckling's troop for the expedition against the Scots, but fell sick at York and returned to London, where he died early in 1639. He left behind an epic, Capit and Pacyke (reprinted by Singer 1820), and three comedies, Holland's Leaguer, A Fine Companion, and The Antiquary. The last form a volume (1875) in Maitland and Logie's Collectanea of the Restoration. The ancient family of the Marmions of Sir William, second baronet, were former hereditary champions at English coronations. They came in with the Conqueror and settled at Tamworth, but became extinct with the fifth baron under Edward I. Scott says of the hero of his poem, 'I have not created a new family, but only revived the titles of an old one in an imaginary personage.'

Marmont, Auguste Frédéric Louis Viesse de, Duke of Ragusa and Marshal of France, was born 29th July 1774 at Châtillon-sur-Seine, entered the army at an early age, and made the acquaintance of Napoleon. He accompanied him to Italy, where his courage at Lodi, Castiglione, and San Giorgio, earned him the rank of general of brigade in the campaign of Egypt. He returned with Bonaparte to France, supported him in the revolution of the 18th Brumaire, and commanded the army of the Alpes Maritime. He became general of division. He was sent to Dalmatia in 1805 to defend the Ragusan territory against the Russians, defeated them at Castelnuovo, and was made Duke of Ragusa. Hence he was summoned to join the great army in 1808, the day before the Battle of Bailen, but was sent forthwith with the pursuit of the enemy, won the battle of Znaim, and earned a marshal's baton. He was thereafter for eighteen months governor of the Illyrian provinces; and in 1811 succeeded Massena in the chief command in Portugal, where he showed skilful strategy in the presence of Wellington. A severe wound, received at the defeat of Salamanca, compelled him to retire to France. In 1813 he commanded a corps d'armée, fought at Lützen, Bautzen, and Leipzig, and gained the title of Marshal of France. In the contest with great spirit in France in the beginning of 1814, till further resistance was hopeless, when he concluded a truce with Barelay de Tolly, which compelled Napoleon to abdicate, and earned himself the title of Duke of Ragusa from the Bonapartists. He distinguished himself in the return of Napoleon from Elba he was obliged to flee. After the second restoration he lived in retirement till the revolution of 1830, when, at the head of a body of troops, he endeavoured to reduce Paris to submission, and finally retreated with 6000 Swiss, and a few battalions that had continued faithful to Emperor Charles, conducted him across the frontier. From that time he travelled much and resided chiefly in Vienna and Venice, where he died, 21 March 1852. He was the last survivor of the Marmions of Ragusa. His chief work is his Essai des Institutions Militaires (1845). His Mémoires fill nine volumes (1856-57). See Sainte-Beuve, Coursiers du Lundi, vol. vi.

Marmontel, Jean François, a famous but hardly a great French writer, was born of an obscure family at Bort, in the Limousin, 11th July 1723. He made his studies in a Jesuit college, and found employment in a literary capacity at Boulanger and early turned to literature, and went to Paris in 1745 by advice of Voltaire. Here he wrote successful tragedies and operas, and was fortunate enough in 1753 to get a secretaryship at Versailles through the influence of Madame Pompadour. Soon after he received a more lucrative appointment, the official journal, Le Mercure, being entrusted to his charge. In its columns he commenced the publication of his finished and ortranslated Contes Moraux (1761). Marmontel was elected to the Academy in 1763, and became its secretary in 1783, as well as Historiographer of France. After the Revolution he retired to the village of Abbeville, near Evreux, where he died, 31st December 1799. His most celebrated work was the well-known Détésaure, a dull and wordy political romance containing a toleration which excited the most furious hostility on the part of the theologians of the Sorbonne, to which Marmontel replied in Les Incas by ascribing the cruelties in Spanish America to religious fanaticism. In 1767 appeared his interesting and valuable, but completely unfounded, Éléments de Littérature, consisting of his contributions to the Encyclopédie. His Mémoires is an interesting survey of his whole life, brightened by glimpses of all the great figures he had seen cross the stage from Massillon to Mirabeau.

His own edition of his complete works fills 17 volumes (1786-87), to which must be added 14 volumes published posthumously. Good editions are those of Villeneuve (1819-20) and Saint-Surin (1824-27). See Sainte-Beuve's Coursiers du Lundi, vol. iv.

Marmora, Lake. See LA MARMORA.

Marmora, Sea of, the Propontis of the ancients, separated from the Black Sea by the straits of Constantinopole (anc. Bosporus). It is of an oval form, is 175 miles in length by 50 in breadth, has an area of 4,490 sq. m., and a maximum depth of 200 fathoms. It extends about 30 miles eastwards into Asia. The sea contains several islands, the largest of which is Marmora or Marmura (area, 50 sq. m.), famous for its quarries of marble and alabaster.

MARMORAL
Marmoset, a name given to a group of American monkeys which are always of small size, and which differ in various particulars from other American monkeys (see Monkey). The popular name of Oiastiti has been given to these monkeys on account of the sharp whistling sound which they make when frightened or irritated.

There are a good many species of marmosets which are placed in two genera, Mihaia and Hapale, both confined to Central and South America. These creatures are easily kept in captivity, and are usually of an affectionate disposition.

Marmot (Arctonyx), a genus of rodents, belonging to the family Sciuridae, resemble squirrels in their dentition, although in form and habits they more closely resemble rats and mice. They have two incisors and two premolars in each jaw, four molars on each side above, and three below. —The Common Marmot, or Alpine Marmot (A. marmotta), is a native of the Alps, the Pyrenees, and the more northern mountains of Europe, up to the limits of perpetual snow, and is found also in Asia. It is about the size of a rabbit, grayish yellow, brown towards the head; feeds on roots, leaves, insects, &c.; and is gregarious, often living in large societies. Marmots spend the winter in their burrows, in one chamber of which is a store of dried grass; but the greater part of the winter is passed in a torpid condition. The Alpine Marmot is easily tamed. There are three kinds of marmots in North America, all popularly termed 'Woodchucks.' The 'Prairie Marmot' (see Prairie Dog) is nearly allied, but does not belong to the same genus.

Marne, a river of France, the most considerable tributary of the Seine, rises in the plateau of Langres, flows north-west past Châlons to Eperey, and thence west, joining the Seine at Charenton, a few miles above Paris. Its length is 320 miles, and it is navigable for 126 miles up to St Dizier. Its stream is rather rapid, and in most places has a wide bed. It is connected by canals with the Rhine, the Aisne, and the Seine.

Marne, a department in the north-east of France, formed out of the old province of Champagne, is traversed by the river Marne, and to a less extent by the Seine and the Aisne. Area, 3159 sq. m.; pop. (1891) 434,692. It is in the dry and chalky soil of the north that the best varieties of Champagne Wine (q.v.) are grown, of which two-fifths are exported. The rearing of sheep is an important industry, and extensive woollen manufactures are carried on. Cereals, beetroot, and potatoes are grown; honey and wax are produced; building stone is quarried; and metal works, tanneries, &c., are in operation. Marne is divided into the five arrondissements of Chalons-sur-Marne (the capital), Epernay, Rheims, Sainte-Ménécoul, and Vitry-le-François.

Marne, Haute, a department in the north-east of France, formed chiefly out of the old province of Champagne, and embracing the lands in the upper basins of the Marne and the Meuse. It rises in the south into the plateau of Langres and the Monts Fauclies (1500 to 1000 feet). Area, 2402 sq. m.; pop. (1891) 243,333, a decrease of 11,343 since 1881. Cereals, wine (12 million gallons annually), fruits, and potatoes are the principal products. The department yields 200,000 tons of iron ore annually, and there are numerous furnaces. The cuttery is in high repute. There are three arrondissements of Chaumont, Langres, and Vassy; capital, Chaumont.

Marnix, Philip van, Lord of St Aldegonde, Dutch writer and patriot, was born at Brussels in 1538. A pupil of Calvin and Beza at Geneva, on his return home he took an active part in promoting the Reformation, and in 1566 a no less active part in the revolt of the Netherlands against Spain. An intimate friend of William of Orange, he was appointed by his great man to be his representative at the first meeting of the Estates of the United Provinces, held at Dort in 1572, and on subsequent occasions was sent on special missions to the courts of France and England. After helping to cement the Union of Utrecht and visiting the diet at Worms, he was nominated in 1583 burgomaster of Antwerp. This city he defended thirteen months against the Spaniards; but, having then capitulated, he incurred so much ill-will that he retired from public life. The leisure of his retirement he utilised for literary work, besides taking an active interest in the newly-founded university of Leyden. From his pen came the Wilhelmius song, the hymn of Dutch liberty and Protestantism; the epoch-making prose satire on the Roman Catholic Church, entitled The Roman Dutchman (1584); a metrical translation of the Psalms from the Hebrew (1580); and the beginning of a prose translation of the Bible. Marnix died at Leyden, 15th December 1589. His works were edited in 7 vols. (Brussels, 1835-59); his religious works in 2 vols. (1871-73). See Lives in Dutch by Bruggrae (1840) and Frédéric (1882), and the French monograph by Jules (1858).

Marocco, See Morocco.

Marocchetti, Carlo, Baron, an Italian sculptor of respectable talent, was born at Turin in 1805, and trained in Bosio's studio. Settling
at Paris in 1587, he produced 'Young Girl sporting with a Dog,' 'Fallen Angel,' relief on the Arc d’Etoile, an altarpiece for the Madeleine, a memorial work for Bellini’s tomb, a statue of Liotur d’Auvergne, &c. On the outbreak of the revolt they fled to London. In Britain his best works were statues of Queen Victoria for Glasgow, of Richard Coeur-de-Lion, and of Lord Clyde in Waterloo Place, London.  Mounted figures of Emmanuel Philibert and Charles Albert of Savoy were chiselled by him for North Italy. He died at Paris on 4th January 1898.

**Maronites**, a Christian sect of Syria, generally regarded as the descendants of a remnant of the Monothelite sect (see *MONOTHELISM*), who settled on the slopes of Lebanon in the 7th century. They take their name from a monk, Maro, who lived in the 5th century, or more probably, especially from their first patriarch Moro (701). These people maintained their independence against the followers of Islam; but in the 12th century, on the establishment of the Latin kingdom of Jerusalem, they abandoned the form of Christian discipline, and, recognising the authority of the Roman Church. In 1445 they entered into a formal act of union with the Roman Church; in 1554 a college was founded in Rome by Pope Gregory XIII, for the education of the Maronite clergy; and in 1736 they formally submitted to the Church of Rome. Nevertheless, they retain their distinctive national rites and usages, and use the ancient Syriac language in their liturgy; their clergy, if married before ordination, are permitted to keep their wives; and they have many festivals and saints not recognised in the Church of Rome. The Maronites, a sturdy, warlike race of mountaineers (see *LEBANON*), number about 250,000. Their patriarch, who is elected by their bishops, subject to the approval of Rome, resides in the convent of Kannah. Many convents for both sexes are spread over the country, and in the neighbourhood of Beirut, above Tripoli; the inmates follow the rule of St Anthony. The relations of the Maronites with their implacable foes, the Druzes, have been already detailed under *DUSES AND LEBANON*. See *Baedeker’s Palestine*, by Socin (2d ed. 1880).

**Maroons**, the name (derived from the Span. *caminar*, from cima, ‘a mountain top’) given in Jamaica and Guiana to fugitive negro slaves. When the British conquered Jamaica from the Spaniards in 1655, numbers of slaves took refuge in the uplands. They and their descendants, called Maroons, maintained a constant warfare with the colonists for 140 years; but in 1705 they were subdued, and a portion of them removed to Nova Scotia, and afterwards to Sierra Leone. The remnant fraternised with their manumitted brethren in 1834-35. The Maroons of Guiana, who are generally called Bash Negroes, about 4000 altogether, form a number of independent communities. See *Dill, History of the Maroons* (1808).

**Maros-Vasarehly**, capital of the Szekler districts in Transylvania, stands on the Maros, 28 miles ESE of Kluensberg. It contains a fortified castle, called Orthodox (Reformed), a library of 70,000 volumes, and a collection of miniatures and antiques, and has a trade in timber, tobacco, wine, corn, and fruits (particularly melons). *Pop.* (1881) 12,833; (1890) 14,212.

**Marot, Clément**, a distinguished French poet of the line of Francis I, was born at Cabors in 1496 (?). He was the son of the archbishop of Lyons, who was both poet and curiater, he began at an early age to write verses, and, abandoning his legal studies, entered the service of Margaret, Duchess of Alençon, afterwards Queen of Navarre, to whom many of his poems are addressed. He was wounded at the battle of Pavia in 1525, and at the end of the year was imprisoned on a charge of heresy, but was liberated in the spring of 1526. Having a witty pen and a satiric turn, and not being particular in his language or speech or conduct, he made many enemies and gave to several patrons considerable trouble. During his absence from Paris in 1535 his house was searched, and compromising literature was found in his library. His claim that a poet should be permitted to read everything publicly is a disallowing sentence at the court of the Queen of Navarre, and later found refuge with the Duke of Ferrara. He returned to Paris in 1536, and in 1538 began to translate the Psalms, which in their French dress became very popular, especially at the court, where they were sung to favourite secular airs, and helped to make the new views fashionable at least. He was encouraged by the king to continue his translation, but the part published in 1541 having been condemned by the Sorbonne, he had again to flee in 1543. He went to Rome, and to Geneva, but, finding Calvin’s company uncongenial, he removed to Naples, where he died in 1544. His poems consist of elegies, epistles, rondells, ballads, songs, sonnets, madrigals, epigrams, nonsense verses, and longer pieces of a general character; and, though he himself tells us that this is the style of the age of Francois I, a gift lay in the direction of bawdiness and graceful satire. Marot has a singularly light touch, and a great power of simple natural expression, and in all his poems—if we except some early rhetorical verses—there is the distinctive style Marotique which has had an important influence on French literary language. Though he was persecuted for his religious views, he expressly declares that he was not a Lutheran, and probably like many of his friends—Duté for instance—he had no very definite theological beliefs.

**Marozia**, a Roman lady of noble birth, but of infamous reputation in the scandalous chronicles of her age, daughter of the equally notorious Theodore, was born in the close of the 9th century. As the mistress of Pope Sergius III., and mother and grandmother of three popes (John XI., John XII., and Leo VII.), she exercised a great influence on the political affairs of her time in Italy. She was married three times, and, if we may credit the narrative of Luitprand, had skill and address enough to procure the deposition and death of Pope John X., and subsequently the elevation of her son as John XI. Marozia’s later years brought on her the punishment of her crimes. She died in prison at Rome in 983.

**Marprelate Controversy**, a bitter war of vigorous and often locally pamphlet-war against official Episcopacy by the Elizabethan Puritans. Many of these men were supernumerary preachers, or not theologically approved ministers, but were published under the comprehensive name of Martin Marprelate. The time of greatest activity was about 1589, and the books were printed in spite of severe government repression. Marprelate was a native of Kingston-on-Thames, Fawley in Northamptonshire, Norton, Coventry, Welstone in Warwickshire, and in or near Manchester. The names of the chief writers were John Penny (hanged), John Udall (left to jail), Penner, John Field, and Job Throckmorton who wrote exercise in *Howe’s Poems*. One of the best attempts to answer the Marprelate writers was Bishop Cooper of Winchester’s *Admoni-
tion, to the People of England. Other writers on the same side were John Lilly and Thomas Nash. Bacon presented to the ministry in 1590 his wise paper, entitled "Of the Decency of Marriage," which was to be printed in the Controversie of the Church of England, an admirable argument for moderation and mutual concession in things indifferent. 'First of all,' he says, 'it is more than time that there were an end and surcease made of this immodes and deformed manner of writing lately entreated, whereby matters of religion are handled in the style of the stage,' Professor Arber has included a reprint of the Marprelate tracts in his 'English Scholar's Library.' See the Rev. W. Mackell's History of the Marprelate Controversy (1845).

Marque, Letter of. See Letter of MARQUE.

Marquesas Islands, or MENDANAS, are a group in Polynesia, N. of Tiuitamotu or Low Archipelago, between 8° and 11° S. lat. and 138° and 141° W. long. The name strictly applies to four or five islands discovered by Mendana in 1595, but usually includes all the the Western group of seven islands, to the north-west, which were discovered by the American Ingraham in 1797. Total area, 492 sq. m. The whole archipelago is volcanic, Hiva-oa and Nuka-hiva are the largest islands. Nearly all are shaped into several narrow valleys, in which live the total population, 5216 in 1885, live. In Cook's time there were 10,000 inhabitants, but in 1838 they had decreased to 20,000. They are perhaps the finest race of the brown Polynesian stock, and, though courteous, are cruel and revengeful. Since 1842 the islands have been a French protectorate. A little cotton is grown by Chinese immigrants.

Marquetry. See Inlaying.

Marquette, capital of Marquette county, Michigan, is on the southern shore of Lake Superior, 430 miles by rail N. of Chicago. It has foundries, blast-furnaces, &c., besides sawmills and machine-shops, and a stone-quarry. Iron ore in very large quantities is mined in the county and shipped from here. Marquette is the seat of a Roman Catholic bishop. Pop. (1900) 10,635.

Marquis, or MARQUESS, the degree of nobility which in the Peerage of England ranks next to duke. Marquises were originally commanders on the borders or frontiers of countries, or on the sea-coast, which they were bound to protect. In England marquises are those marquises or lords-marchers of the borders of Scotland and Wales in the reign of Henry III, and the foreign equivalent Markgraf was common on the Continent; but the first English marquis in the modern sense was Robert de Vere, Earl of Oxford, who was created Marquis of Ulbin by Richard II. in 1385. The title was first introduced into Scotland in 1599, when the Marquises of Huntly and Hamilton were created. For the coronet of a marquis, see Conyne. The mantle is scarlet, with three and a border of ermine. A marquis is styled 'The Most Honourable;' his wife is a marchioness, his eldest son takes by courtesy the next lower title in the peerage, except where that is identical with the title of the marquise, in which case he must take his father's title. The younger sons of a marquis are styled 'Sir,' and daughters 'Lady,' with the addition of Christian names, or Christian names.

Marr. See Mar.

Marriage denotes the union of man and woman in the legal relation of husband and wife as the same may be defined by local law or custom. The term may be properly applied to connections between the sexes which to civilised people seem exceedingly slight and loose, provided that they are founded on contract, are intended to endure, and are approved of, or at least permitted, by public or group opinion; but these are conditions essential to marriage. It is a state of law which is not regulated by other circumstances than those in which the wife is got by capture; for no relations or consequences that can be called legal can arise out of an act of violence which arouses resentment and provokes retaliation; but, if the captor's tribe approve, there may be de facto marriage, and marriage-like records. In addition, the tribe of the woman acquiesces in the capture when effected, in which case an approach is made to marriage with the form of capture — i.e., marriage proceeding upon a contract, but carried out through a form or pretence of capturing the bride.

Many nations have had traditions of a time when marriage was unknown among their own predecessors, and of some lawgiver to whom its institution was ascribed, who was, for example, among the Egyptians, Menes; among the Chinese, Fu-hsi; among the Greeks, Cecrops; among the Hindus, Svetaketu. And if man had to work out his own institutions it is plain that societies everywhere would need time for arriving at those regulative customs, in the absence of which there would be no marriage, and neither right nor wrong in matters of sex; there would, indeed, instead of a law, be an unenforceable and unenforceable violated that law of incest (exogamy) which cut off men from marrying all women of their own kindred, however remote the relationship, the women among whom their connections must have been made at first. Darwin, founding upon observation of the higher animals, where, at any rate, the springing up of marriage custom, the jealous rage of the male would determine that there would be no general promiscuity of the women, and that there would at first be a prevalence of polygyny. It should, however, be remembered that among early peoples and backward peoples, with marriage as fully defined, jealousy has often been practically unknown. Observation of men, savage and civilised, would perhaps suggest that, before some notion of right in matters of sex had sprung up, there would be no uniform behaviour in these matters, that men would do as they could, as passions were agitated; or opportunity offered, and that they would not be over-restrictive in their connections — i.e., that they might be polygamists, polyandrists, or monogamists according to circumstances, and that there would be as much promiscuity as there was opportunity for.

An attempt to show in outline the history of marriage and of kinship has necessarily been made under the head of Family (q.v.), and to that reference must here be made. In that account the beginnings of marriage are traced to the predominance of a modification of promiscuity, to Nair polyandry, or something equivalent to it, which could yield a system of kinship through females only — a limitation of kinship which can only have become established when there was usually no father in the household, and a system of certain, not thought of, or not claimed. Ultimately, in advanced societies everywhere, marriage came to be regarded as not to be duly constituted without a religious sanction.

While the exogamy forbids a man to marry any woman of his own clan and the endogamy has been named endogamy forbids a man (where it prevails) to marry any woman who is not of his kindred. Endogamy has been widely prevalent, and not among rather advanced populations only, but among the Nuerich are decidedly backward; but there are indications, often obscure, of marriage having been preceded by exogamy, and it may be taken to have been preceded by it at least in most cases. Exogamy, if this be conceded, has
prevailed at one time or another nearly everywhere. The known cases in which peoples have depended for their welfare or very lives, after a con-
tract for marriage, gone through the form of cap-
turing the bride (which undoubtedly is a relic of 
capture), are a most extensive class; and exogamy 
gives the explanation of all such cases. Exogamous 
men having unfriendly neighbours might have to 
go to war; and if they did not, they might get them 
from their neighbours; and when these also were 
exogamous, we may believe that in time captures 
would be made easy—that reciprocal captures 
would be more or less arranged, until at length 
there were contracts made for exchange or pur-
chase. Hume says that there were matters of 
trade only. As a form capture has in fact lingered on, 
in shapes more or less distinct, in the marriage 
ceremonies of many modern peoples. For an 
attempt to show the origin of the law, which 
had the remarkable effect of interfering marriage 
between all men and women of the same blood or 
kindred, see The English Historical Review, No. 9, 
January 1888; and The Origin of Exogamy, by 
J. F. McLennan.
This account of exogamy takes it to have been 
in the beginning an interdict upon warring or 
the practice, but the difficulty is rather to see how men came 
to abstain from marrying their own women than how, that point reached, they afterwards went on to 
abstaining from them altogether. Of course, it 
had to be kept in view that the law of exogamy 
must be a law of the people, if it is of universal 
prevalent and then obligatory, and that, while it was 
growing up, the practice must have been 
simply the same that it was after it had got the force 
of law, so that, if exogamy at first necessitated 
practice of capturing wives, it must have been 
that practice which was eventually 
solidated as exogamy. Groups composed of a 
single totem kindred, when exogamous (see 
FAMILY), could only get wives by capture. And 
thus it was a practice (1) of capturing women 
of stranger groups for wives, and (2) of taking for 
wives only stranger or foreign—i.e. captured— 
women that had to be accounted for. A long-con-
tinued scarcity of women (which infanticide might account for) is suggested as the explanation of a 
universalistic practice of capture, and the position 
of the woman in marriage of the more ancient, on 
the one hand, and their own women (these being scarce) 
on the other, as the explanation of marriage being 
ultimately confined to captured or foreign women. 
What is scarce is of importance, and the position 
of women among their own kinsmen must have 
tended to be high, so that something like the Nair 
relation only could be formed with women by their 
kinsmen, and that it may be without any con-
tract, practically, at anyrate, at the woman's mere 
choice. The captured woman, on the other hand, 
would be a slave: the captors could have her as 
subject wife, absolutely on their own terms. It is 
this sort of connection that was destined to 
stall, to become the type of marriage, and it was the lot 
of the captive, not of the kinswoman. To subject 
the latter to it would have been an outrage, an 
offence against all principles of justice. The 
form of marriage was growing up—and probably until after con-
tinues had capture easy, i.e. more or less 
of a form, when there would be practically exchange 
of women—and then to the interdiction of such 
connections, time being given, does not appear to 
the difficulty. Many marriages captured or 
forced are seen not to be excluded. This account of exogamy is, at 
anyrate, founded at every point upon human 
and its observed tendencies. The scarcity 
and the basis of the history of marriage which 
traces that institution 
back to polyandrous beginnings.
See works cited at FAMILY, and in addition, Darwin, 
Descent of Man (1870); Fison and Howitt, Kamilaroi 
and Kurnai (1880); A. Lang, Custom and Myth (1884); 
Max Kovacevic, De l'Origine de la Famille et de la 
Propriété (1890).
The solemn and binding nature of marriage is 
recognised by all civilised peoples; and, although 
in various countries there is vast difference in details, 
both as to legal obligations and public ceremony, there is much substantial agreement. Thus the 
restrictions as to age, consanguinity, &c. which 
prevail in England and other modern countries 
were nearly the same in the Roman law, where, 
however, the consent of the paterfamilias was an 
element of the ceremony, not a law that marriage 
was a sacrament and not as a contract; but it recognises 
the validity of marriage by mere consent, and with-
out ecclesiastical sanction, in countries where such 
marriges are treated as valid.
England.—A promise of marriage, given in ex-
change for any promise of the other party, is binding 
in English law. Performance is not enforced, 
but damages may be recovered for breach of promise. It is not necessary that the promise should be proved 
by writing. The parties may give evidence, but the 
plaintiff cannot recover unless his or her testimony 
is supported by corroborative evidence. If 
If either party discovers that the other has 
engaged to gross misconduct, or of serious misrepre-
sentation in regard to his or her circumstances and 
previous life, breach of promise may be justified. 
Males of fourteen and females of twelve, not 
subject to any physical or mental incapacity, are 
permitted to contract marriage; but for the marriage 
of a minor the consent of the father or guardian 
required, or the mother, if the minor is a 
woman, or the 
and their own women (these being scarce) 
the other, as the explanation of marriage being

the latter to it would have been an outrage, an 
offence against all principles of justice. The 
form of marriage was growing up—and probably until after con-
tinues had capture easy, i.e. more or less 
of a form, when there would be practically exchange
for entry of notice, and one shilling for certificate. Parties desiring to be married without delay must obtain a license dispensing with the ordinary forms. The Archbishop of Canterbury may grant a special license (which is issued by his vicar-general) for marriage at any time or place. License for a marriage in church is obtained by an affidavit on an affidavit as to residence, absence of lawful impediment, and (if either party be a minor) consent of parents or guardians. A license may also be obtained on giving one day's notice to the superintendent-registrar, and making a declaration as to residence, and the fees for the license are considerably higher than those paid for banns and for the ordinary certificate. It is to be observed that the registrar cannot give a license for marriage in church. His ordinary certificate is usually accepted in lieu of banns; but a clergyman may insist on banns or episcopal license when the marriage is in church.

In the actual celebration of marriage the law requires that the ceremony take place between 8 A.M. and 3 P.M. (12 A.M. until 1868), that the parties be present, and states what papers have to be produced to their marriage, that formal words of consent be used in the presence of witnesses, and that the marriage be duly registered. If the marriage is in church, the prayer-book service is used, and the minister enters the marriage in the register. If it is in a nonconformist church, the minister enters the marriage in the register. A person elected by those residing in the same building a registrar must be in attendance. Persons who wish to be married according to a seafar or customary may be married at a register office, in the presence of a superintendent-registrar, and of a registrar and two other witnesses. Persons so married may afterwards go through a religious ceremony, but such ceremony is not a marriage, in the legal sense of the word, and therefore must not be registered. In 1868 a Royal Commission reported on the marriage laws of the United Kingdom, pointing out the grave inconveniences resulting from the maintenance of different laws in England, Scotland, and Ireland, and from the uncertainty of the English law. The excessive formality of the statute law is in some degree neutralised by the rule that a marriage is not invalid by reason of the irregularity or defect in which both parties are cognizant. Thus, a man who is married in a false name is duly married, unless the wife is a party to the deception; and it has been held that a marriage in church, without legal evidence, is valid, if the wife is under the belief that the husband has not lived with the lawful wife. In another case the registrar, who had made a mistake in the form, was held that the marriage was valid. For these and many other reasons, there are others peculiar to marriage only. Thus, impossibility renders a marriage void, and a previous marriage, while it subsists, prevents either of the parties from lawfully contracting marriage. Conscientious objections are also forbidden by an old statute (regulating which, however, doubts have been expressed as to whether is force is not gone by desuetude), and relationship within certain degrees prevents the relations from marrying. The forbidden degrees, as in England, are drawn from the Jewish law as set forth in the Book of Leviticus (see above). A further preliminary requisite to a valid marriage is that one or other of the parties shall have resided in Scotland for a term immediately preceding the marriage. This term varies according to the form which marriage takes. It is in the case of a Roman Catholic, and for a Protestant, or the Roman Catholic Church, and for such a marriage it is 12 months. An insignifi- 

matters in contracting marriage the law of Scotland is peculiar among those of

matters in contracting marriage the law of Scotland is peculiar among those of
other nations for the freedom which it allows to the contracting parties. If their present consent to marry has been obtained by the imposition of a special form of proof, imposes no restrictions as to time and place, and enjoins no special mode of celebration. The blessing of the church is not required by the law of the land to make a marriage good; although all marriages celebrated without the assent of the clergyman or by irregular marriages. It is enough that the parties give their free consent to marry each other. If a man and woman have lived together as husband and wife, and have had the reputation among their neighbours of being married by some legal and regular form of proof, this reputation is general in the neighbourhood, uncontradicted by any one and of considerable duration in point of time, these parties will be held to have exchanged a consent to marry, and the courts will declare them to be married. This is called marriage by habit and it is sometimes
Where a promise to marry has been given and sexual intercourse between the parties has followed in Scotland, upon the faith of the promise, the court, upon proof of the promise by the writing or the oath of a defender, will declare the parties to be married. This is known by the name of marriage by promise, and the necessity of this rule is not to be presumed by law, but is proved in the most unequivocal way either by writing or witnesses. These cases are distinguished as marriages by promise of present consent per verba de presenti. According to this form persons may marry, by delivering a written declaration of consent to marry, and by making a written declaration to that effect, and acting upon their declaration. This method of interchange of words of present consent was the one followed in the Gretna Green (q.v.) or 'over the border' marriages by runaways from England. They were checked by Lord Brougham's Act of 1836, requiring residence in Scotland for twenty-one days as a pre-requisite to the validity of an irregular marriage. But if this condition be fulfilled they are considered legal, as long as they stay in the country. They may be convicted before a magistrate or justice of the peace of having contracted an irregular marriage; and, as the conviction is recorded in the books of the court and stands as evidence of the marriage, this way of getting married has been thought to be the cheapest known way of securely tying the bonds of wedlock, since it entails no necessary fees to any functionary. But persons convicted of an irregular marriage are required to register their marriage, and the registrar is entitled to a fee of twenty shillings. Parties to an irregular marriage may apply within three months after its date to the sheriff for a warrant to register their marriage. The sheriff grants warrant upon proof of the marriage by writing or by sworn evidence of the union in the register. The entry in the register is declared by statute to be evidence of the marriage. The proceeding of applying to the sheriff for warrant to register is often believed by the parties to be a civil ceremony of marriage, which it is not. Any marriage to which the consent of the spouses is proved is lawful. But marriage differs from contract in that it cannot be modified or dissolved by consent, nor rescinded on proof of fraud. The law in some states requires that marriages be solemnised by a magistrate before a clergyman or a magistrate. Pennsylvania provides that marriages must be

59

MARRIAGE

Cases of irregular marriage by interchange of words of consent, though much more common than those of marriage by habit and repugn to be married nor are the law regarding the presence of a clergyman or the sanction of the church as necessary to marriage. If a clergyman officiates at a marriage he may do so only after the publication of Banns (q.v.) or publication of notice by a magistrate or registrar. Before these preliminaries the marriage becomes a clandestine marriage, and the clergyman and the parties are subject to penalties. When notice to the registrar of an intention to marry takes the place of banns, the notice is entered in a Marriage Notice Book, and publicly posted on the registrar's office for seven days, after which time, if no objections are taken, the registrar issues a certificate of publication of notice which authorises a clergyman to marry the parties producing it. There is now no provision of law restraining clergyman of other Churches than the Established Church from solemnising Presbyterian marriages by marriage regular and lawful. The ceremony is usually conducted by a clergyman at the house of the bride's father; although of late years there have been signs that Presbyterians may come to adopt the custom of marrying within the church walls. The proceedings are usually to include, an express inquiry whether the parties consent to marry; a declaration by them, given generally by a nod or a curtesy, that they do consent; a solemn admissio by the clergyman; a declaration by him that the parties are of marriage regular and lawful. The ceremony should take place in the presence of witnesses who know the parties, and who are capable of giving evidence. After the marriage is solemnised (which may take place any hour of the day), a schedule, which is given out to the parties along with the certificate, requires that, if there is no publication of notice by a registrar, has to be presented, filled up, to the clergyman; signed by the parties, the clergyman, and at least two witnesses, and delivered to the parties, who must transmit it within three days, under penalty of the registrar of the parish in which the marriage is solemnised. See HUSBAND AND WIFE, DIVORCE. Ireland.—The law of Ireland as to the constitution of marriage is substantially the same as that of England. The form of celebration may differ according as the marriage is solemnised in the Roman Catholic, or the Presbyterian Church; or between persons of different religious persuasions; but the legal rights and duties of the several churches with regard to marriages are now practically the same. The forms of marriage are now practically the same.

United States.—In the United States the general rule in almost all the states is that no specific form is necessary to the constitution of marriage if the consent of the spouses is proved. But marriage differs from contract in that it cannot be modified or dissolved by consent, nor rescinded on proof of fraud. The law in some states requires that marriages be solemnised by a clergyman or by a magistrate before a clergyman or a magistrate. Pennsylvania provides that marriages must be
solemnisèd before twelve witnesses. But a marriage good at common law is good notwithstanding any statute on the subject, unless the statute contains an exception or annulability. The original law of the prohibited degrees has been modified; and the prohibition of marriage with a deceased wife's sister is all but unknown.

Marrow

is a substance of low specific gravity filling the cells and cavities of the bones of mammals. There are two varieties, which are known as red or watery marrow and yellow or oily marrow.

In some of the short bones, as the bodies of the vertebrae and the sternum, the marrow has a reddish colour, due to the presence of cells which have this colour and are supposed to be transition forms between the proper marrow cells and red blood-corpuscles. On analysis it is found to contain 75 per cent. of water, the remainder consisting of albuminous and fibrinous matter, with salts and a trace of oil. In the long bones of a horse, for example, the cells are filled with a yellow, oily fluid, contained in vesicles lined with a thin layer of common fat, which are imbedded in the interstices of the medullary membrane—i.e. a highly vascular membrane lining the interior of the bones.

This marrow consists of 90 per cent. of oil and 4 per cent. of water, connective tissue, and vessels.

Marrow Controversy

one of the most strenuous and memorable struggles in the religious history of Scotland, took its name from a book entitled the Marrow of Modern Divinity, written by a Puritan soldier in the time of the Commonwealth.

The highly evangelical character of this work, and especially its doctrine of the free grace of God in the redemption of sinners, had made it a great favourite with the few zealous and pious ministers then to be found in the Church of Scotland, and in 1718 an edition was published by the Rev. James Hog of Carnew. A committee of the General Assembly debated against the work and were free in its offer of salvation, and the Assembly formally condemned the book. Twelve ministers, amongst whom were Thomas Boston (q.v.) and the Erskines (q.v.), protested against this decision, and were ultimately excluded from the Assembly, the national sympathy being on the whole in favor of the 'Benevolents' or 'Marrow-men.' The controversy was substantially the same that, in 1733, resulted in the deposition of Ebenezer Erskine, and the origin of the 'Secession' body.

Marron

See REED.

Marryat, FREDERICK, was born in West- minor on July 10, 1792. He was the second son of John Marryat, who for some years was special agent for the island of Grenada. In 1805 he went as a midshipman under Captain Lord Cochrane on board the Impregnable. He spent some years of active and dangerous service under his famous captain in the north-west coasts of France, on the north coast of Spain, and in the Mediterranean, taking part in many of the incidents which he afterwards described in Frank Mildmay and Mr Midshipman Easy. 'The cruises of the Impregnable,' he wrote in his private log, 'were periods of continuous excitement. The original hour by which she was posted on her anchor till she dropped again in port; the day that passed without a shot being fired in anger was with me a blank day; the boats were hardly secured on the booms than they were off loose and out again.' After visiting West Indian waters in the Lotus and Spartan frigates he received a lieutenant's commission in 1812, and was soon after appointed to the sloop Espigule, in which he cruised on the north coast of South America. He was afterwards appointed to the Imaginary, but was appointed commander at the age of twenty-three, in 1815, at the close of the great war.

In 1819 he married Miss Sheirn, the daughter of a Scotch gentleman, and was then appointed to the Beaver sloop, which was kept cruising off St Helena to prevent ships from entering Napoleon. After doing good work in suppressing the channel smugglers in the Rosario he was sent out in command of the Larne to Burma, where his men suffered severely in river-work and stockade-fighting.

On his return to England his services were rewarded by the Companionhip of the Bath and the command of the Ariadne, of twenty-eight guns.

He resigned in 1830 and never afterwards applied for a ship, but settled in Sussex House, Hammersmith, and thenceforth led the life of a man of letters. Frank Mildmay, his first novel, appeared in 1829, and the King's Ora in 1830. In 1832 he became editor of the Metropolitan Magazine, to which he contributed Newton Forster (1832), Peter Simple (1833), Jacob Faithful, Japhet in Search of a Father, and Mr Midshipman Easy (1834). After four years abroad he severed his connection with the Metropolitan and wrote for the New Monthly at the rate of £20 a sheet. Stanley Vale and The Pasha of Many Tales came out in 1836, and in 1837 Marryat set out for a tour through the United States, where he remained for nineteen years, and where he wrote The Phantom Ship (1839) and a drama, The Occasion of His Life, which was produced at a New York theatre. His literary work was fairly remunerative: he received £1200 for Mr Midshipman Easy, £1600 for his Diary in America, and similar sums for his other books.

But he was not content and lucky in his speculations, and he lost heavily through the estate of Langham in Norfolk. During his later years his means were greatly narrowed, and his life seems to have been shortened by overwork. His Diary in America was issued in 1839, and was followed before the close of 1842, his book on The Argonaut, Ready, The Poocher, and Pec-mult Keone. In 1843 he settled on his Norfolk property, where he spent his days in farming and in writing stories for children.

He published Settlers in Canada in 1844, The Missions in 1846, The Printer's Man in 1846, and the Children's Book of 1847. Valerie was only partly Marryat's; and Rattlin the Reeper, though included in the list of his novels, was written by E. Heward, his sub-editor on the Metropolitan Magazine. His health broke down in 1847, and after rupturing several blood-vessels, he died at Langham on August 9, 1848. He was an excellent officer and a generous man, though quick-tempered, extravagant, and over-eager in the pursuit of enjoyment.

As a writer of sea-stories Marryat has no superior. He cannot write, he is living fully home to his readers the beauty and the taste of the deeps. But for invention, narrative skill, and grasp of character, and especially for richness of humour, he stands first of all those who have dealt with the sea and sailors in prose fiction. No doubt his fun often descends to farce: still setting Dick Sauntson, there is no English novelist who has awakened hearty and honest laughter. His happiest creations, Mr Chucks, for example, and Terence O'Brien, and Mr Easy and Nasty and Equality Jack would not unworthily find places in the gallery of the greatest novelist. His best work, in fact, stands high sound in workmanship. They betray no sign of straining after effect; the prose is direct, clear, and vigorous, an ideal, in its way, of the narrative of adventure. Nothing, for example, could well be
mores vivid, yet nothing could well be simpler and more reserved in style, than such a passage as the club-hailing of the Dionide (in Peter Simple), where—as is usual in Marryat—the excitement and peril of the moment are brought home to you in the tersest phrase, by dramatic flashes and apt touches of dialogue. His sea-fights, his hairbreadth cuts, and cutting-out, 1850, are sold with irresistible gusto. The writing is as unpretentious as it is spirited and truth-like. You have only to compare the action between the Rattlesnake and the three schooners (in Peter Simple), or the fight between the Aureole (in Mardi) and the Tartar (in Midsummer Essay), with Fenimore Cooper's attempts in the same line to be convinced of Marryat's immense superiority as an artist. His books have been the delight of boyhood since they first appeared; and you can turn to them in after years confident of a renewal of past enjoyment. The sailors of the Great War live in his pages as vividly as certain ranks and classes of Londoners live in the pages of Dickens.

See Life and Letters of Captain Marryat (1872), by his daughter Florence Marryat, herself a prolific novelist; and the Life of Captain Marryat, by David Hanney (Great Writers series, 1889).

Mars (archaic and poetic: Mavors; in the song of the Arrow Brothers, Mournar; the Osian form is Manara), an ancient Italian divinity of war and of husbandry, identified by the Greekising Romans with Ares (q.v.). As the father of Romulus he was specially the progenitor of the Roman race, and he shared with Jupiter the honour of being styled Mater, the forms Marspater and Masgater being common for Mars Pater. Other titles were Mars Gradivus, as the warlike god; Silvanus, as the rustic god; and Quirinus, from his relation to the state, and his especial care for Roman citizens in their civil wars. His quiritic rival was Quirin, the Silvi, danced in complete armour. The wolf and the woodpecker were sacred to him. He had many temples at Rome, the most celebrated of which was that outside the Porta Capena, on the Appian Road, and that of Mars Ultor built by Augustus in the forum. The Campus Martius, where the Romans practised athletic and military exercises, was named in honour of Mars; so was the month of March (Martius), the first month of the Roman year. The Ludi Martiales were celebrated every year in the crescent on 1st August. See PLANETS.

Mars, Madeleine. Anne Françoise Bonnet-Desgouttes (1745-1801) was at one time the French flower of atheism during the first forty years of the 19th century, was born in Paris on 5th February 1779, the illegitimate daughter of an actor Montet and an actress Mars. She began to act before she was thirteen, joined the Théâtre Français in 1799, and died at Paris on 20th March 1847. She was equally mistress of comic parts as of those of the coquette, and was especially successful in Molière's masterpieces. Her Mémoires were published in 2 vols. in 1849, and her Confidences in 3 vols. in 1855.

Marsala, a seaport on the westernmost point of Sicily, 102 miles by rail and 53 as the crow flies SW of Palermo, and 250 from the commune, 40,250 (45,000 in 1893). It is defended by a citadel, has a cathedral and an academy of sciences, and carries on a large trade in wine, the well-known Marsala, which became popular from having been supplied to the British fleet in 1802. It resembles Livorno, and is exported principally to England and the West Indies. The town occupies the site of Lilybeum, the ancient capital of the Carthaginian settlements in Sicily, and was selected by Garibaldi as his landing-point for the Sicilian expedition of 1860. It obtained its present name from the Saracens, who occupied it in the 9th century, but were driven out by the Normans in the 11th. The harbour was filled up by Charles V. in 1557 to prevent a Turkish attack; it was reconstituted during the 19th century. On an average some 1900 vessels of 165,300 tons burden (one-fifth British) enter every year, bringing chiefly staves, grain, and spirits to the annual value of £8,960. The total exports reach an annual value of £204,750, of which £187,720 is for wine.

Marseilles, the stirring song or hymn of the French Revolutionists, was composed in 1792, in 1792, by a young officer, Rouget de Lisle (q.v.), then stationed at Strasbourg. He composed both words and music under one inspiration one night in April after dining with the mayor of the city; Chant de l'Armée du Rhin was the name he gave it. The song was specially carried by enthusiastic revolutionists to the chief cities of France. It was brought to Paris by the volunteers of Marseilles, who sang it as they entered the capital (30th July) and when they marched to the storming of the Tuileries. Hence the Parisians called it La Marseillaise. It was sung with such universal fervor as to bring a hymn of the republicans of France. More than one writer has called in question Rouget de Lisle's claim to have composed the music; but his originality seems to have been proved. Interdicted under the Restoration and the Second Empire, the Marseillaise became again the national song on the outbreak of the Franco-German war. See Le Roy de Sainte-Croix's monograph (1880) and Lotth's inquiry into its real author (Paris, 1886).

Marseilles, in point of population the third city of France, being surpassed by Paris and Lyons only, is the chief town of the department Bouches-du-Rhône, and situated on the south coast about 27 miles E. of the mouth of the Rhône. The principal commercial port of France, if not of the entire Mediterranean, Marseilles is entered annually by 7500 vessels (average for the period 1855-95) of 4,300,000 tons burden; of this commerce nearly three-fourths is French, the British being more than one-seventh. The total tonnage of Spain, Italy, Greece, and Holland together is only a little more than the British. The imports and exports together reach an annual value of 75 to 70 millions sterling; three-fifths being for imports. Wheat, wine, oranges, and tobacco (42,000 tons), wine, spirits, and beer, sugar, maize, oats, barley, coffee, olive, palm, and cotton oils, pepper, flour, and tallow figure most prominently, in the order named, amongst the imports; whilst the exports consist chiefly of cardamoms, spices, tea, casks, flour, sugar, oil, wine and spirits, soap, candles. Marseilles is the head-quarters of the Messageries Maritimes, Générale Transatlantique, Marseillaise, and other great French commercial companies. An average of 29,700 emigrants, of whom only 1500 are French, embark from this port every year. The harbour accommodation consists of the old harbour, a natural basin of nearly 70 acres, running into the heart of the city; a series of new docks, quays, and warehouses (La Joliette, &c.) extending fully a mile along the shore to the west of the old harbour, and covering about a hundred acres; and an outer roadstead between the dams to these docks and a breakwater constructed in deeper water; besides dry-docks, wet-docks, slips, &c. The industry of the place is very considerable, the first place being taken by every manufacture of soap, vegetable oil and olive oil; soda, sugar, macaroni, iron, lead, zinc, tiles, and leather are manufactured. Several hundreds of men are employed in the flour-mills and in the wine-vaults. There is a prosperous fishing fleet.

The city of Marseilles is built on the slopes of the Céze-overlook, and its streets are either narrow, with walls of late years extended to the south-east. Although greatly improved since 1853, the sanitary condition
MARSH, MES (née Anne Caldwell), was born in 1791 at Lindley Wood, Staffordshire; married in 1817 the junior partner of the larger Fannitroy; from 1854 and 1857 produced a score of novels, of which the best was: "The last wild woods," Emilia Wyndham (1846); new ed. 1888), and Norman's Bridge. In 1858 she came into the Lindley Wood property, where she died 5th October 1874.

MARSH, OTHNIEL CHARLES, palaeontologist, was born at Lockport, New York, 29th October 1831, graduated at Yale in 1850, and studied zoology, geology, and mineralogy, almost entirely. In 1866, he became the first professor of Palaeontology at Yale, and thenceforward devoted himself to the investigation of extinct American vertebrates, of which in various expeditions to the Rocky Mountains he discovered over a thousand new species, some representing wholly new orders. They include a new sub-class of odontornithes, a new order of pterodactyls (pteranodon), the tillaodontia and diocerata, fossil monkeys from the Green river of Wyoming, and several new families of Dinosauria. During his course of work, Marsh described many of his discoveries in the American Journal of Science, and issued a series of valuable monographs (published by government) on Odontornithes (1859); Dinosauria (1884), and Ceratopsia (1888). He was elected to the Royal Society of Harvani, Ph.D. of Heidelberg, and in 1877 received the Big by medal of the Geological Society, London. Died 18th March 1899.

MARSHAL (Fr. maréchal; Old High Ger. marst, 'a battle-horse,' and schall, 'a servant'), a term meaning originally a grooms or manager of the horse, though gradually the term was extended also to the officers of the household. In England the word has been used for the heralds, the stables, and the keepers of the hounds, but in France it was applied also to other officials of the state. The royal marshal is the highest of the office, and the earl-marshal the highest of the earl-marshal's servants. The latter is now head of the Heralds' College (see HERALD), and the dignity is hereditary in the family of the Duke of Norfolk. In Scotland the office of marshall was hereditary in the family of Keith (q. v.). In 1716 George, tenth Earl Marshal, was attainted in consequence of his share in the rebellion of the previous year, and the office has since been in abeyance. In France the highest military officer is called a marshal, a dignity which originated early in the 13th century. There was at first only one Marshal de France, and there were but two till the time of Francis I. Their number afterwards became unlimited. Napoleon's marshals are celebrated. From the title of this class of official officers the Germans have borrowed their Feld-marshall, and the British (since 1750) their Field-marshall.

MARSHALL, capital of Harris county, Texas, stands at the junction of three railways, 40 miles W. of Shreveport, Louisiana. It contains a ladies' college, and has railway machine-shops, foundries, and a trade in cotton. Pop. (1900) 7835.

MARSHALL, JOHN, chief-justice of the United States, was born in Fauquier county, Virginia, 24th September 1755, and was studying law when the Revolution began. He served for several years under his father, Colonel Thomas Marshall (1739-1802)—from 1775 to 1779; in 1780 he received, while in Richmond, a license to practice
a; and in 1781, after a final campaign, he settled down to his profession. He quickly gained distinction, and eventually rose to be head of the Virginia bar. From 1782 he sat in the Virginia House of Burgesses, the state council, the legislature; in 1788 he was elected to the state convention, which ultimately—mainly owing to his Marshallites (q.v.) arguments—adopted the new United States constitution. In 1797 he was appointed joint envoy, with Pinckney and Gerry (q.v.) to France, where he and Pinckney, as Federalists, were ordered to leave the republic, after the envoys had indignantly declined Talleyrand's overtures for a personal and public loan. His conduct in this matter only made Marshall more respected and popular at home, and in 1799 he was elected to congress; on 12th May 1800 he was appointed secretary of state, which office he held till March 1801. In January 1801 he was appointed chief-justice of the United States, and this position he occupied until his death, at Philadelphia, 6th July 1835. Chief-justice Marshall's long series of important decisions are recognised as standard authority on questions of constitutional law; a selection was published at Boston in 1839, and eventually a Life of Washington (5 vols. 1804-7; revised ed. 2 vols. 1832) from papers placed at his disposal by the president's family. See John Marshall, by A. B. Magruder ('American Statesmen' series, Boston, 1885).

Marshalling of Arms. See Heraldry.

Marshall Islands, a group in the western Pacific Ocean, by 10° N. lat., and having the Caroline group to the west, consists of two parallel chains of low coral-reefs—one, the Latok group, consisting of fifteen islands, and measuring in all 43 sq. m.; the other, the Latik group, eighteen islands, with a total area of 107 sq. m. The coconuts and pandanus palus and the bread-fruit tree are the principal sources of food, besides fish. Coprah is the only export (2000 tons annually). The inhabitants, 11,600 in number, belong to the Micronesian division, and are an ugly but good-natured and hospitable race, fond of song and dance, and sellers of best mats. The Boston (U.S.) Mission Society have a branch here. These islands were annexed by Germany in 1885. See Hager, Die Marshallinseln (Leip. 1886).

Marshalltown, capital of Marshall county, Iowa, near the Iowa river, 50 miles N.E. of Des Moines, at the crossing of two railways. It has a large trade in wheat, &c., has foundries and machine-shops, and manufactures flour, oil, soap, and fencing-wire. Pop. (1890) 8914; (1900) 11,544.

Marshallsea, the jail attached to the Marshallsea Court, originally established under the emarl- marshal of England for the trial of servants of the royal household. Later on it came to be used as a prison for debtors and defaulters, as well as persons convicted of piracy or other offences on the high seas. It stood near the church of St George, Southwark, and existed in the reign of Edward III. It was abolished as the Palace Court in 1640. The Bishop Bonner was confined here for nearly ten years, till his death in 1569, and George Wither in 1613; he obtained his release by his Sajure to the King's most excellent Majesty. But the Marshallsea will be longest remembered as the home of Dickens's Little Dorrit.

Marshmallow (Althaea), a genus of plants of the natural order Malvaceae. The species, which are not numerous, are annual and perennial plants, with showy flowers, natives of Europe and Asia.—Only one, the Common Marsh-mallow (A. officinalis), is an undoubted native of Britain, and is common only in the south, growing in meadows and marshes, especially near the sea. The whole plant is white, some, abounding in fibre, mucilage, starch, and saccharine matter. It is in this form chiefly that the mucilage abound. The emollient and demulcent qualities of marsh-mallow are well known in medicine, and in seasons of scarcity the inhabitants of some eastern countries often have recourse to it as a principal article of food. Lozenges made from it (Pâtes de Guinâcarn) are in use. It is said to be palatable when boiled, and afterwards fried with onions and butter. The Hollydock (q.v.) is commonly referred to this genus.

Marsh-marigold (Caltha), a genus of plants of the natural order Ranunculaceae, having about five petal-like sepals, but no petals; the fruit consists of several spreading, compressed, many-seeded follicles. C. palustris is a very common British plant, with kidney-shaped, shining leaves, and large yellow flowers, a principal ornament of wet meadows and the sides of streams in spring. It partakes of the aeriality common in the order; but the flower-buds, preserved in vinegar and salt, are said to be a good substitute for capers. It is often called Cowslip in the United States.

Marsilio. See Ficino.

Marsivan, a town of Asia Minor, in the vilayet of Sivas, 23 miles N.W. of Amasia, with a silver-mine and a pop. of 11,000.

Marston, JAMES WESTLAND, LL.D., dramatic poet, was born at Boston, Lincolnshire, on 30th January 1820. He was articled to his uncle, a London solicitor, but soon gave up law for literature; and in 1842 his Patrician's Daughter, a...
blank-verse tragedy of the day, was brought out at Drury Lane by Macready. It was the first, and along the month of the sole, of more than a dozen plays (Stratford, Philip of France, &c., all Sheridan-Knowlesian, and all forgotten, though a collective exhibition of them and his poetic works appeared in 2 volumes in 1876. Besides these, he wrote a number (1651), a good share of which, according to A. M. Durfey (1888), is subject to a mass of poetic criticism. Although his house had once been the gathering-place of several of the most prominent literary men in London, Marston died in that city alone (wife, children, grandchildren, all dead before him on 23rd March 1600).—His son Philip, Bouke Marston, the blind poet, was born in London, 13th August 1630, and died there on 14th February 1687. His life was a series of losses—of sight, of friends, and after-wards of his sister, his promised bride, and his two dear friends, Oliver Marston Brown and Rossetti. His memory will survive through his friendships—with the last and with Watte and Swinburne—rather than through his sonnets and lyrics. They are exquisite some of them, but too sad for a world that has seen him's All, and the end. Four Plays were the three volumes of works that he published in his lifetime, between 1570 and 1883; to a posthumous collection of his stories is prefixed a memoir by Mr. W. Sharp.

Marston, John, dramatist and satirist, a son of John Marston, of Gayton (or Heyton), County Salop, by his wife Maria, a daughter of Andrew Guarsi, an Italian surgeon, who had settled in London, was born about 1575, probably in Coventry. He matriculated at Brasenose College, Oxford, 4th February 1591-92, and was admitted B.A. 6th February 1593-94. From the elder Marston's will (dated 24th October 1591) it may be gathered that, after adopting the profession of the law, he abandoned it against his father's wish. He married (but the date of his marriage cannot be fixed) Mary, daughter of Rev. William Wilkes, chaplain to James I. and rector of St. Mary's, County Wilts. Ben Jonson wittily observed to Drummond of Hawthornden that 'Marston wrote his father-in-law's preachings, and his father-in-law his comedies, contrasting the asperity of Marston's comedies with the blandness of the chaplain's sermons.' Being, on every estimate, 'honest Coriolanus,' Marston's plays were published between 1602 and 1607. He gave up play-writing about 1607, but the date at which he entered the church has not been ascertained. In 1616 he was presented to the living of Christ Church, Hampshire, which he resigned in 1631. He died 23rd June 1634 in Aldermanbury parish, London, and was buried beside his father in the Temple Church, 'under the stone which hath written on it Oblivion Succum.' His widow was buried by his side, 4th July 1657.

Marston's first work was The Metamorphosis of Pygmalion's Image: and Certain Satyres (1598). Another series of satires, The Scourge of Villany, appeared later in the same year, a second edition (with an additional tenth sain) following in 1599. Pygmalion, a somewhat licentious poem, may have owed its inspiration to Shakespeare's Venus and Adonis. Marston pretends that it was written with the object of bringing discredit on amatory persons generally, but his chief object was the beauty of his lady. A bishop Whigfield condemned it to the flames, with other works of a similar tendency. The satires, which were published under the nom de plume of 'William Kinnsayer,' are uncouth and obscure. They represent the spirit of Marston and the satirist Joseph Hall (the future bishop of Norwich), and many hard knocks were dealt on either side. A Cambridge man, one 'W. J.,' intervened with his volume of satyres, The Satire, in which he handled Marston roughly; and he was answered, not very effectively, by one of Marston's friends in the anonymous Whisper of the Satire. The controversy raged hotly and excited lively interest, but the allusions in these various satirical pieces are not without literary interest.

In September 1609 Henslow records in his Diary that he advanced forty shillings to Mr. Maxton, the new poet (Mr. Marston), in part payment for an unnamed play. This new 'poet' was Marston; but there is no other mention of him in the Diary. Nevertheless, during the last year of his life, the two Plays, The Malcontent, in which he collaborated with Thomas Middleton, and Melitida and Antonio's Revenge, were entered in the Stationers' Register, 24th October 1601, and were published in the following year. They contain passages of striking power, and a deal of intolerable blank verse. In 1604 is published the Malcontent, a second edition, augmented by Webster, appearing in the same year. It is more skilfully constructed than the two parts of Antonio and Melitida. Marston's command of bold and vivid imagery is effectively displayed in the description of Antonio's rape in The Malcontent in very cordial terms to Ben Jonson, and in 1605 prefixed some complimentary verses to Sejanus. There seem to have been many quarrels and reconciliations between Jonson and Marston. Jonson told Drummond that 'he was much quarrelling with M.' D. and in 1615 took his pistol from him, wrote his Postmaster in him, the beginning of them before Marston represented him on the stage in his youth given to venery.' The original quarral began in or about 1598.

The Dutch Courtezan (1605) is full of life and spirit, the character of the venomous courtesan Franceschina being drawn with masterly ability. Eastward Ho (1605), from which Hogarth is said to have taken the plan of his prints 'The Indiscreet and Idle Prentices,' was written in conjunction with Ben Jonson. The character was more genial than any comedy which Marston wrote single-handed. Some satirical reflections on the Scots were introduced, for which offence the authors were committed to prison at the instance of Sir James Murray, and the report went that their papers were taken out. Paria as Parasitaster, or the Fawen (1600), in spite of occasional tediousness, is an attractive comedy; but the tragedy of Sophonisba (1600) appalls us with its horrors, the description of the witch Erichtho and her crew being gruesomely to the last degree. What You Will, published in 1607, but probably written some years earlier, has many flings at Ben Jonson. The Invective Countess was published in 1613 with Marston's name on the title-page, but in a copy (belonging to the Duke of Devonshire) of the 1613 edition the author's name is given as William Barkstead, a poet of small account. The rich and graceful poetry scattered through The Invective Countess is unlike anything that we find in Marston's undoubted works. Probably Marston left the play unfinished when he recovered his liberty, and it is not improbable that the poet fell ill and died immediately after. An indifferent anonymous comedy, Jack Drum's Entertainment, written about 1600, may be safely assigned to Marston from internal evidence; and he appears to have had some share in another play, Hotromastix. In 1633 William Sheares, the publisher, issued a volume of The Works of Mr John Marston, comprising the two parts of Antonio and Melitida, Sophonisba, What You Will, The Fawen, and The Dutch Courtezan. Marston's works were edited by the late Mr Halliwell-Phillipps (then Mr Halliwell) in 1856, 3 vols., and by the present writer in 1887, 3 vols.
MARTEN

Marston Moor, in the West Riding of Yorkshire, 7 miles W. of York, the scene of a great parliamentary victory, 24 July 1644. The royalist army, about 22,000 strong, was led by Prince Rupert; the parliamentary troops numbered 15,000 foot and 5,000 horse, consisting of a Scotch army under the Earl of Leven, a Yorkshire army under Fairfax, and one from the eastern counties under the Earl of Manchester, with Cromwell and Crawford. The battle began about seven o'clock in the evening. On the king's left flank the horse under Goring scattered the forces of Lord Fairfax; on his right the troopers of the fiery Rupert were broken by the first time by Cromwell's 'Jombites.' Hastily recalling his men from the chase, Cromwell saved the day by supporting Manchester and the Scotch infantry against the king's foot under Newcastle, and routing Goring's horse flushed with their victory. Before nightfall the success was complete, and the king's army fled in utter rout to York, leaving 4000 men dead on the field; among them all Newcastle's 'Whitecoats.' This victory gave the Roundheads in Parliament, and first brought into prominence Cromwell's military genius. See S. R. Gardner's History of the Civil War (1886), and Edward Lamplough's Yorkshire Battles (1891).

Marsupials, lit. 'ponched animals' (Marsupialia, Didelphia, or Metatheria), a sub-class of mammals. The members of which, with the exception of the American opossums, are now restricted to the Australian and Austro-Malayan regions. They are in many ways simpler than the higher mammals, notably in the structure of the brain and in the absence of a close connection between the unborn organ in the womb of the mother. The young are born very helpless, after a short gestation, and are usually stowed away in an external pouch or marsupium, where they are fed from the enclosed teats. From the wide occurrence of fragmentary marsupial remains in Triassic and Jurassic strata, young in the womb and the New World, it seems that the pouch-bearers have been once widely distributed. Before the stronger mammals which rose up after them they have, however, succumbed, except in the case of the above-mentioned American opossums, and those saved by the insularity of the Australian region, before any higher mammals gained a foothold. In the retreat thus afforded the marsupials have developed along numerous lines, as it were prophesying the carnivores, insectivores, rodents, and herbivores among the placental mammals. Thus, apart from the carnivorous and insectivorous American opossums (Didelphydae), of which one is strictly North American and the rest neo-tropical, there are five Australasian families: the Dasyuride or 'native cats,' carnivorous and insectivorous marsupials as large as wolves and as small as mice, of which very pronounced types are the Tasmanian 'tiger' (Thylacinus) and the native ant-eater (Myrmecobius); the rodent-like Peramelide or lasioeleote; the herbivorous kangaroo rats and kangaroo rats (Murcopteridae); the very varied family of arboreal Phalangers (Phalangistidae), including the flying opossums (Petaurista, &c.), the native sloth or koala, the honey-sucking Tarsipes, and other curious forms; and finally the Phascolomyside or wombat-like rodent-like root-eating forms about the size of badgers.

See MAMMALS; also the well-known works of Owen, Huxley, and others on Vertebrates; the relevant parts of Cassell's and the Standard Natural History; Chisholm's travels in the Vogel's Specht's Mammals (1867); Waterhouse, Native History of Mammals of Australia (1844); and Gould's Mammals of Australia (3 vols. 1845-63).

Marsyas, a Phrygian satyr, who, having found a flute that played itself, which Athena had thrown away, was rash enough to challenge Apollo to a musical contest, subject to the condition that the victor should do what he liked to the vanquished. Apollo played upon the cithara, Marsyas upon the flute, and the Muses decided in favour of the god, who punished his rival's temerity by binding him to a tree and flaying him alive. From his blood sprang the river Marsyas; his statue stood in many ancient cities, a monument of the folly of presumption.

Martaban, a town in Burma, on the right bank of the Salween, opposite to Moulmain (Moulmein). It is reputed to have been built in 970 by the first king of Pegu, and was destroyed in the end of the first quarter of the 14th century the capital of the kingdom. It was taken by the king of Siam two centuries and a half later, and has been twice captured by the British, in 1824 and in 1852. Pop. 1751. The Bay of Martaban receives the rivers Trawadi and Salween.

MarteI. CHARLES. See CHARLES MARTEL.

Martello Towers are round towers for coast defence, about 40 feet high, built most solidly, and situated on the beach. They were so called because at Martello Point in Corseica a small round tower stood adorned with an immense cannonade from an English fleet under Lord Hood in 1794. They were mostly erected at the end of the 18th century as a defence against French invasion, and are now regarded as obsolete.

Marten (Mustela), a genus of digitigrade carnivorous quadrupeds of the family Mustelidae, differing from weasels in having an additional false molar on each side above and below, a small tubercle on the inner side of the lower carnivorous cheek-teeth, and the tongue not rough—characters which are regarded as indicating a somewhat less extreme carnivorous propensity. The body is elongated and supple, as in weasels, the legs short, and the toes separate, with sharp long claws; the palms and soles are generally, but not always, furry. The ears are larger than in weasels, and the tail is bushy. The martens exhibit great agility and gracefulness in their movements, and are very expert in climbing trees, among which they generally live. There are nine or ten species in this genus, which are distributed over Europe, Asia, Malaya, and North America. The American Marten (M. pennanti) is the largest species, measuring as much as 46 inches from the snout to the tip of the tail. The most valuable species of marten is the European Sable (M. zibellina). Two species of marten, closely resembling another one, occur in Great Britain—the Common or Beech Marten (M. vulgaris), and the Pine Marten (M. martes). They are often hunted with foxhounds; for this and other reasons they are getting much less plentiful, though still to be frequently met with in certain localities. The Pine Marten (Mustela martes).
MARTENSEN, Hans Lassen, metropolitan bishop of Denmark and the most prominent theologian in the 19th century, was born at Flensborg on 19th August 1808, and studied at the university of Copenhagen. After shaking off the influence of Grundtvigianism, by which he was dominated in his youth, he became the chief of the Danish Church. In 1845, he published a valuable monograph on \textit{Meister Eckhart}, the German mystic, and nine years later laid the foundation of an English college for a masterly work, his Liber Instrumentalium \textit{in} \textit{Christian Dogmatics} (Eng. trans. 1860). This gained him in 1854 the primacy of Denmark, and this again was the cause of a powerful satirical attack upon him by Kierkegaard, which started a controversy in which Martensen suffered severely. His great intellectual energy, however, and the force of his character soon enabled him to recover from the blow, so that, after the publication of another great work, in 3 vols, \textit{On Christian Ethics} (1871–78; Eng. trans. 1881–82), his influence in the country, as in literature, increased. With a mind wonderfully acute and powerful, he was deficient in intellectual sympathy. Nevertheless he stood for many years a bulwark of defence to conservative theology. He died on 3rd February 1884. See his \textit{Autobiography}, in Danish (1882), London (1883), and \textit{Brit. and Foreign Review}, vol. xxxv.

Martha's Vineyard, an island on the south coast of Massachusetts, 21 miles long, 6 miles in average width. It is noted as a summer health-resort.

Martial. Marcus Valerius Martialis, one of the finest among the few original Latin poets, and still the first of epigrammatists in verse, was born 1st March 38 or 41 a.d., in Celtiberian Spain, at Bilbilis, famed as a steel factory, for which its iron mines and lee-cold Salo torrent specially fitted it—a centre, too, of Roman culture, which afforded him the good education he got under the eye of his parents, Fronto and Flaccilla. Like other gifted young provincials, he repaired to Rome, where became a close friend of the influential Spanish house of the Senecesth, through which he found other patrons, among them L. Calpurnius Piso, the leading man of his day. The tragic failure of the Poenitent poet lost Martial his ward of honor, and Calpurnius Scipio; and from whose heirs, however, he doubtless derived the small wine-growing estate at Nomentum. Of his life till Domitian became emperor we know little, except that he never maintained himself by the steady professional work to which his patron Quintillus seems to have exhorted him, but rather courted imperial and senatorial patronage by his rare social gifts and his genius for versa de circumstance. When (80 a.d.) Titus, by a series of gladiatorial spectacles, delighted the Colosseum to the impression of Horace, Martial signalled the occasion by epigrams which brought him the \\textit{prætern libros curricularen} and the equestrian rank—probably proposed by Titus, and afterwards confirmed by Domitian. Substantial independence, however, he did not obtain from either emperor, though his valediction to Domitian into the的心 of corrupt retinue was gross enough to leave a stain on his memory. In request as a diner-out, he divided his day between the baths, the theatres, the resitaitio-halls, and the composition of epigrams. This, however, he was glad to count the most distinguished senators of the time among his friends, and all the literati in city or province among his readers. In envy and detraction he had, of course, his share; but what he most complained of was not, for instance, the jealousy of Statius, his young Neapolitan competitor for imperial favour, but the use of his name by malignant poetrists, who fathered on him their own libels on the leaders, including the ladies, of society. What we have of Martial is by no means tempted by his best work, unfortunately, is his least pure, and this has produced an exaggerated impression of his moral turpitude. If, however, we exclude 150 epigrams from the 1172 of the first twelve books, his collective writings (including his early \textit{spectacular epigrams} and his \textit{Xana} and \textit{Aphophora}) are free from licentiousness. On the other hand, his genius and skill in verse it was hard to over-calculate. An \textit{improvisator in readiness}, he could attain to the most fastidious finish; with his love of antithetical shocks and electric surprises, and the time poet in ever so natural a style, he could alternate the organ-note of a masterful eloquence with minor tones of the most tremulous pathos—witness his epigrams on 'Arria and Petus', on 'Pompeii,' on his little slave-girl 'Erosion,' and on 'Formis' with its lovely sense of pathos. Martial, at his best, is a poetic magus, even in its modern and restricted sense, that he remains without a peer, wielding a weapon peculiarly his own, bright and pointed as a rapier from the anvil of his native Bilbilis, chastened in the rushing Salo. Unequal, of course, he often is, but never, probably more rarely (that is, with all his sense of the ridiculous degenerating into cariature. He lifts the veil from the Rome of Domitian and exposes it mainly on its seamy
side, with a Hogarthian vividness not outdone by John Bull himself.

Martial had to wait long for an adequate commentator, and has found him in the author of the "Sittungsgeschichte der Roms," Ludwig Friedländer, who alone combined the critical power and the archeological knowledge necessary for the study of Martial. "Vorstellung von der Welt nach Martial," 14.31, while 1417). It is often thought that Martial himself was mistaken in the account of his own life in "Epistola," 14.31, while 1417). He was often noted for the pontiff in whose election was finally extinguished the great Western Heresy of spiritual censure in his behalf. But all his efforts to buttress the French power in Sicily proved futile, and three years after the atrocity of the Seylani Vespers he died, 1285.—MARTIN V. must be noticed as the pontiff in whose election was finally extinguished the great Western Heresy of spiritual censure in his behalf. But all his efforts to buttress the French power in Sicily proved futile, and three years after the atrocity of the Seylani Vespers he died, 1285.—MARTIN V. must be noticed as the pontiff in whose election was finally extinguished the great Western Heresy of spiritual censure in his behalf. But all his efforts to buttress the French power in Sicily proved futile, and three years after the atrocity of the Seylani Vespers he died, 1285.

MARTIN V., was named Otto di Colonna, of the great Roman family of that name. On the deposition of John XXIII., and the two rival popes Gregory XII. and Benedict XIII., in the council of Constance, Cardinal Colonna was elected (1417). He returned to the see in 1889, and was re-elected in all the subsequents sessions of the council, and the fathers having separated without discussing the questions of reform, at that period earnestly called for by the church, Martin undertook to call a new council for the purpose. It was summoned to meet at Siena, and ultimately assembled at Basle in 1431, but the pope died suddenly just after its opening.

MARTIN, St., Bishop of Tours, was born at Salabria in Pannonia about the year 316. He was educated at Pavia, and at the desire of his father, who was a military tribune, entered the army, first under Constantius Gallus, in the army of the Visigoths, and then with the Emperor Gallienus. He was destined for the Apostate. The virtues of his life as a soldier are the theme of more than one interesting legend. On obtaining his discharge from military service, Martin became a disciple of Hilary of Poitiers. He returned to his native Pannonia, and converted his father to Christianity, but he himself endured much persecution from the Arian party, who were at that time dominant; and in consequence of the firmness of his orthodoxy, he is the first confessor, rather than martyr, honoured in the Latin Church with an office and a feast. On his return to Gaul about 360 he founded a convent of monks near Poitiers, where he himself led a life of great austerity and seclusion; but in 371 he was drawn by force from his retreat, and made Bishop of Tours. The fame of his sanctity, and his reputation as a worker of miracles, attracted crowds of visitors from all parts of Gaul; and in order to avoid the distraction of their importunity, he established the monastery of Marmoutier near Tours, in which he himself resided. He died between 397 and 401, and St. Ninian, who had visited him at Tours and was near the end of his life, undertook for him, dedicated to his memory the church he was then building at Whithorn in Galloway. His life by his contemporary, Sulpicius Severus, is a very curious specimen of the Christian literature of the age, and in the profusion of miraculous legends with which it abounds might take its place among the lives of the medieval or modern Roman Church. The only extant literary relic of Martin is a short Confession of Faith on the Holy Trinity, which is published by Galland, vol. viii. 559. In the Roman Catholic Church he is the patron of the imitation of the Holy Trinity, which is published by Galland, vol. viii. 559. In the Roman Catholic Church he is the patron of the imitation of the Holy Trinity, which is published by Galland, vol. viii. 559. (1830), followed by three others treating of the period of the Fronde. He next joined Paul Lacroix, the 'Bibliophile Jacob,' in his vast project for a history of France in 48 volumes, containing extracts from histories and chronicles from the earliest period to 1830. He published the first volume in 1833, and henceforward toiled alone at the vast undertaking, which was completed on a smaller scale in 1838. He now set himself to a still more extended task, 'Histoire de France' (15 vols. 1833–36). A third and much improved edition (10 vols. 1837–54) earned the Gobert prize; the fourth edition (17 vols. 1855–60) was awarded by the Institute in 1859 the great prize of 20,000 francs. His 'Mahomet' (1839) appeared in 12 volumes to 1879; its continuation to the author's own time formed the less admirable Histoire de France Moderne (2d ed. 5 vols. 1878–83). Martin acted for a time as maire of one of the arrondissements of Paris; and was chosen deputy for Aisme in 1871, senator in 1878. He was elected a member of the French Academy in 1878. He wrote several minor histories, such as the Histoire de Saisons (1837), Daniel Martin (1839), Jeanne d'Arc (1872); and died at Paris, 14th December 1883. Martin was the last of the giants of French history influenced by the revival of humanism. \[\ldots\]

**Lady Martin**, well known as an actress by her maiden name, Helen Faneu, was born 11th October 1820, and made her professional début as Julia in the Haymarket at Covent Garden in January 1830. She was at once successful, took a leading part in Macready's Shakespearian revivals, in the first representation of Lytton's plays, and in Browning's 'Plot in the Scutcheon and Strafford.' As an interpreter of Shakespeare's heroines, Juliet, Rosaline, Lady Macbeth, she stood first among the actresses of her time. After her marriage to Theodore Martin in 1851 she left the stage, appearing only at rare intervals for public or charitable purposes, as Beatrice at the opening of the Shakespeare Memorial Theatre at Stratford. In 1883 she published a volume of delightful studies entitled, *On Some of Shakespeare's Female Characters* (Ophelia, Portia, Desdemona, Juliet, Imogen, Rosalind, and Beatrice). She died 31st October 1898.

**Martina**, a town of Southern Italy, half-way between Taranto and Monopoli. Pop. 14,454.

**Martineau, Harriet**, born at Norwich, 12th June 1802, was the daughter of Thomas Martineau, a Norwich manufacturer. She received a good classical education, and worked diligently and conscientiously, but did not in her school-days show promise of anything remarkable. Increasing deafness and constant ill-health made her often anxious and unhappy as a girl, uncertain in temper, and in her work of study. Her first article was published in 1821, when she wrote an article for the *Monthly Repository*, a religious periodical. In the next few years she wrote *Devotional Exercises*, articles for the *Monthly Repository*, and short stories about machinery and wages. In 1829 the failure of the house in which she, and her mother and sisters, had placed their money obliged her to earn her living. In 1830 she wrote *Traditions of Palestine*, and gained three prizes for three Theological Essays for the Unitarian Association. In 1831 she resolved to bring out a series of stories as *Illustrations of Political Economy*, knowing that the work was wanted. Notwithstanding repeated refusals and discouragements from publishers, she persevered in her plan, and in 1832 the first number appeared. A fortnight after publication the demand for this number was two thousand, and the way was open to her for life, and she never had any other anxiety about employment than what to choose, nor any real care about money. Her popularity was extraordinary during the appearance of *Illustrations of Political Economy*. She removed to London in 1832, the better to reach her readers. But in 1834 she went to America for two years, and soon after her return published *Society in America* and a novel, *Deerbrook*, in 1839. She went abroad the same year, returned ill, and settled at Tynemouth, where she remained, a complete invalid, till 1844. During her illness she wrote *The Hour and the
Man, four volumes of children’s tales, and Life in the Sick-room. She recovered through mesmerism, left Tynemouth, and fixed her abode in the Lake Country, where in 1845 she built herself a house in Ambleside. The same year she published Forest and Farm Tale Tales. In 1848 she visited Egypt and Palestine, and on her return issued Eastern Life. In 1849 she completed Knight’s History of the Thirty Years’ Peace; in 1851, in conjunction with H. G. Atkinson, she published a series of Letters on the Laws of Man’s Social Nature and Development; and in 1881 she edited and translated Comte’s Positive Philosophy. She also wrote Household Education, Biographical Sketches, and contributed largely to the daily and weekly press and the larger reviews. She died 27th June 1876, and was buried at Birmingham. Her Autobiography, written and printed many years before, was published with an editorial volume in 1877.

Harriet Martineau was brought up as a Unitarian, and describes herself when a girl as ‘sincerely and heartily religious. Her views gradually changed, and she became an Agnostic. She was a vigorous thinker, and said what she had to say. Her sympathy, kindness of heart, integrity of mind, and impartiality of judgment won esteem and affection for her, even from those who did not share her opinions, and few literary women have in their time enjoyed more fame than she did.

Martineau, James, theologian, brother of the preceding, was born at Norwich, 21st April 1803. He was educated at the grammar-school of his native city, and under Dr Lant Carpenter at Bristol, and had already been a Unitarian minister at Dublin and Liverpool. He was in 1841 corresponding fellow of Jesus College, President of Mental and Moral Philosophy at Manchester New College. He removed to London when that institution was transferred thither in 1857, becoming also one of the pastors in Little Portland Street Chapel. He became principal of the college in 1858, and held the office till his retirement in 1883. Martineau was recognised for fifty years as one of the profoundest thinkers and most effective writers of his day. Earnest and lofty in his aims, and catholic in his sympathies, he unites strong grasp of thought and power ofWieland, and the jovial, lighthearted, and refined style. Indeed in the power of elucidating the most abstract thought he has seldom been surpassed, and he is no less learned than original. Martineau received the degree of LL.D. from Harvard in 1872, Doctor in Theology from Leeds in 1875, and D.D. from Edinburgh in 1884. He was one of the founders of the National Review (1855-64), and was a frequent contributor to its pages. He died 12th January 1900.

His principal works are The Rationale of Religious Inquiry (1836); Hymns for the Christian Church and Home (1840); Endowments after the Christian Life (2 vols. 1843-47); Memorials (1892); Studies of Christianity (1858); Essays, Philosophical and Theological (3 vols. 1868); Hymns of Praise and Prayer (1874); Hours of Thought on Sacred Things (2 vols. 1876-80); A Study of Spinoza (1882); Types of Ethical Theory (2 vols. 1885); A Study of Religion: its Sources and Contents (2 vols. 1888); The Seat of Authority in Religion (1890); and Studies, Reviews, and Addresses (1894).

Martinet, a French general of the time of Louis XIV (q.v.).

Martineau, called by the natives Madiana, is one of the Lesser Antilles, in the West Indies. It is 43 miles long by 12 to 20 broad, and has an area of 390 sq. m., and (1865) 16,962 inhab. The inhabitants are mostly Mulattoes. The island was discovered by the Spaniards in 1493, colonised by the French in 1633, and except for three short intervals (1761-63, 1794-92, 1800-14), when it was held by the British, it has been a French colony ever since. A mountain-knot in the north (4430 feet) and another in the south are connected by a low ridge, all being densely covered with trees. There are numerous short streams. The coasts are irregular and high, except on the west, where stand St Pierre (pop. 20,000), the principal commercial place, and Fort de France (15,000), the capital, which was nearly destroyed by fire in 1809. The climate is moist and hot (annual mean 79° F.), and yellow fever is a not unfrequent visitor. The soil is very productive. About one-half of the land in cultivation is occupied with sugar-cane the staple crop. Of the other half about 75 per cent. is planted with manioc, sweet potatoes, bananas, and other food plants, whilst coffee, cocoa, and tobacco are each cultivated to a small extent. There is also considerable grazing of cattle, sheep, and goats. The exports (sugar, molasses, and rum mostly) average nearly £850,000 annually; the imports (textiles, flour, fish, rice, and cotton, &c.) about £553,000. Slavery was abolished in 1848; labour is largely performed by coolies (27,000). Railways connect the principal towns. See works on Caribbean. See also Fort de France 1877, Rey (1881), Aube (1882), and Basset (1886).

Martimnas, in Scotland, is one of the four term-days for paying rent—viz. 11th November.

Martinsburg, capital of Berkeley county, West Virginia, in the Shenandoah Valley, 114 miles by rail W. of Baltimore, contains a large distillery, several mills and factories, and extensive railway-songs.

Martins Ferry, a city of Ohio, on the Ohio River, 89 miles by rail SW. of Pittsburg, contains iron-works, &c., and very large glass-works. Pop. (1900) 7760.

Martius, Carl Friedrich Philipp von, traveller and naturalist, was born on 17th April 1794, at Erlangen, and studied medicine there. In 1817-20 he went to Brazil as member of a scientific expedition sent out by the Austrian and Bavarian governments, and by his researches in that country acquired a reputation which ranked but little inferior to that of Humboldt. This reputation was chiefly established by the books he published after his return—on the jungle, a work of nearly 2000 pages, several on the cryptogams, palms, and other plants of Brazil, on the medicine of the Indians, and on the ethnology and languages of that region, besides other botanical works. He was professor of Botany 1829, and Director of the Botanic Garden (1832-64) at Munich, and died in that city on 13th December 1868.

Martius’ Yellow. See Dyeing.

Martos, a town of Andalusia, Spain, 16 miles SW. of Jena, on a steep hill crowned by an old castle. Pop. 14,654.

Martyn, Henry, a missionary-martyr, was born at Truro, February 18, 1781, and educated at Truro grammar-school and St John’s College, Cambridge. He was the son of a sugar-planter and slave-dealer, and Smith’s prizeman in 1801, and next year became Fellow of his college. At first lie meant to study law, but the influence of Charles Simeon, acting on his own enthusiastic temperament, determined him for a missionary. He translated the New Testament into Hindustani, Hindi, and Persian, as well as the Prayer-book into Hindustani and
the Psalms into Persian; and next, his armour rising as the sands of his time ran swiftly on, save his immortal calvary and his steadfastness, till he sank exhausted by fever, 6th October 1812. His Life was written by Sargent (1819; new ed. 1856), Willerforce (1837), and G. Smith (1892).

Martyr (Gr. martyr, martyr, "a witness"), the name given in ecclesiastical writing to one who, by their fearless profession of Christian truth, and especially by their fortitude in submitting to death itself rather than abandon their faith, bore the "witness" of their blood to their superhuman origin. Of the same use of the word there are some examples also in the New Testament; as in Acts, xxii. 20; Rev. ii. 13; xvii. 6. But this meaning, as its technical and established signification, is derived mainly from ecclesiastical writers. During the persecutions of the Christians in the first three centuries (see Church History), contemporary writers and all Christian record, that many Christians, preferring death to apostasy, became martyrs or witnesses in blood to the faith, often in circumstances of the utmost heroism. The courage and constancy of the sufferers won the highest admiration. It became a special privilege to receive the martyr's benediction, to kiss his hands, to visit him in prison, or to converse with him; and a practice arose by which the martyrs gave to sinners who were undergoing a course of public humiliation, a communion to their bishop (see Indulgence). The day of martyrdom, moreover, as being held to be the day of the martyr's entering into eternal life, was called the natal or birth day, and as such was celebrated with peculiar solemnity, and with special religious exercises. The mass and the other objects which they possessed were called Relics (q.v.), and their tombs were visited for the purpose of asking their intercession (see Canonization). Cyprian says of catechumens who died before baptism, that they had been "burned with the most glorious baptism of blood;" and the blood baptism was held to result sin and the temporal penalty of sin also. The number of martyrs who suffered death during the first five centuries of Christianity has been a subject of great controversy, but John Fuller says, with the natural pride of partisanship, have, it can hardly be disputed, been "leashed to the side of exaggeration. Some of their statements are palpably excessive; and Gibbon, in his well-known 16th chapter, throws great doubt even on the most moderate of the computations of the church historians. But it is clearly enough briefly shown by Guizot, in his notes on this celebrated chapter, that Gibbon's criticisms are founded on unfair and partial data; and that even the very authorities on which he relies demonstrate the fallaciousness of his conclusions. The first recorded martyr of Christianity, called the "proto- martyr," was Stephen, whose death is recorded in Acts, vi. and vii. The protomartyr of Britain was Alban of Verulam, who suffered under Diocletian in 296 or 303. 

Martyrology, a list of the commemoration days of Christian martyrs, generally with some account of their life and death, arranged in the order of months and days, and intended partly to be read in the public services of the church, partly for the guidance of the faithful in their devotions. The use of the martyrology is common to both Latin and the Greek Church; in the latter it is called menolog, or "monthly-calendar." Nearly all the later Western martyrologies are based upon one or other of three works, the Hieronymian, the Lesser Roman, and Beleña's Martyrology. The first, which was stated to be compiled by St. Jerome from records of martyrologists collected by Eusebius, is itself a compilation from numerous earlier sources, and is not an accurate copier of many facts long subsequent to Jerome's time. A copy of the Lesser Roman Martyrology was discovered at Ravenna by Ado, Archbishop of Vienne, in 856, and seems to have been rather a private historical calendar than one intended for public use. The independence of the two underlies to us only in later editions, chiefly of the 9th century, as that of Florus of Lyons, Hrabanus Maurus, Ado of Vienne, and Ussarid of Paris, as well as that of Notker of St Gall (912). The best-known modern work, that of the Emperor Basil, the Macedonian, in the 9th century, was edited in 127 by Cardinal Urbini. In 1866 Professor W. Wright published a Syrian martyrology recently discovered by him, and written in or before 412. The official Roman Martyrology, designed for the entire church, was published by authority of Gregory XIII., with a critical commentary, by Baronius in 1568; an enlarged edition of the same was issued by Rosweyd in 1618.

Martyr, Peter. See Peter (St).

Marut is, in Hindu Mythology, the god of wind. See INDIA, Vol. VI. p. 104.

Marvell, Andrew, was born March 31, 1621, at Winestead, in the East Riding of Yorkshire, where his father, who three years later became master of the grammar-school and lecturer at Trinity College in Hull, was rector of the parish. In his thirteenth year he went to Trinity College, Cambridge, with a Hull exhibition, and in 1639 graduated B.A. In January 1641 he lost his father, drowned in crossing the Humber, "to the great grief of all good men," says Fuller, and at the close of the same year his university career came to an end, through non-observance of his "days and acts." It was probably after coming of age in 1642 that he set out on his travels. It is said that he met Milton in Rome, and that they publicly argued against the superstitions of the Romish Church, even when Milton was at the Vatican; but unfortunately for the legend Milton came home nearly three years before Marvell set out. He was four years abroad, in Holland, France, Italy, and Spain, but there is no sign of his return until 1649, when his name appears to one of the energies of the Royalists. He was of the Lancastrian of "his noble friend Richard Lovelace," the royalist. His sympathies were still more clearly shown next year in his fierce lites on May, the historian of the Long Parliament. In the summer of 1650 Lord Fairfax engaged Marvell, whose father he no doubt knew, as tutor to his young daughter Mary Fairfax, afterwards Duchess of Buckingham. By him, apparently, Marvell was introduced to Milton, who in February 1653 recommended him to Bradshaw as a good scholar and linguist, and qualified to act as assistant Latin secretary. Though possibly in 1653, the record certainly brought him under Cromwell's notice, for in July he was appointed by him tutor to a Mr Dutton, called, unaccountably, Cromwell's nephew. In 1657 he was appointed Milton's assistant, and in January 1658, when Fairfax and Cromwell's parliament as member for Hull, for which he was returned again in 1660, and again in 1661. In 1665-66 he accompanied Lord Carlisle as secretary to the embassy to Muscovy, Sweden, and Denmark, but the rest of his life was devoted to devoting himself to writing for the benefit of the nation and party, resisting the misapplication of the liberty with which the House was invested, the defence of the nation, and doing battle in the House and out of it, with the partisans of intolerance and arbitrary government. He died somewhat suddenly, August 18, 1678. The Popish
Plot panic had just set in, and, being a marked man, he was supposed to have been made away with by poison. His death, however, was really due to natural causes, an attack of tertian ague and "the ignorance of an old conceived docetor" (Morton's Pyrhost skilled. 1632: Athe motorists, No. 2419). He was buried in St. Elick's churchyard in the town of Tclallah ye pewes in ye south side," according to Aubrey.

Marvell's claims to remembrance are concisely summed up when he is described as 'poet, patriot, and friend of Milton,' but the second is the title he is best known by. The referral of a casual bribe has sent him down posterity as a profligate of patriotic virtue, and the fact is as severe a satire on the corruption of his time as anything in his own writings. Attempts have been made to tone down popular admiration in his case, by suggestions, for example, of temperate habits, founded on a casual remark of Aubrey's, though it is clear from the context that Aubrey meant nothing of the kind; and a stain on his character has been found in the grossness and vulgarity of the political satires that bear his name. But many of these are the exception of one or two cases, we have no right to assume that he was the author of these things. The *Advice to a Painter* is vouched for by Aubrey, but for the rest we have no better authority than the printer of *Poems on Affairs of State* (1669), a man with a knack for selling books to the people of two past reigns: and, as he has put the name to two or three pieces Marvell did not write, he may have put it to more. But, even if Marvell did write them, we must recollect that it was a coarse age, and not to be effective he had to use language and ideas. Because he resided under Cromwell and was a friend of Milton, it is often assumed that he was a Roundhead and a republican, but his own words belie the assumption. The royalist fervour of his youth cooled, and he admired Cromwell because he drew nearer with a strong hand, and 'made England great and his enemies tremble,' but he was no admirer of Cromwell's rule. He was a constitutionalist before all things. In his prose tracts and his letters to his constituents, he makes it clear that if Charles could have kept straight he would have had no sturdier supporter than Andrew Marvell, but even in his despair his attitude is expressed in his own noble line, 'Tis godlike good to save a falling king.' Marvell's works are divided by the Restoration into two very distinct groups: After 1660 his pen was given up to politics, except when his friendship for Milton drew from him the lines prefixed to the second edition of *Paradise Lost*. In 1672-73 he wrote the *Rehearsal Transformed* in answer to Barker, afterwards Bishop of Oxford, who had come forward as the advocate of religious intolerance; and in 1676 a similar work, *Mr. Spruce, or the Divine in Mode*, in reply to Turner, Master of St. John's, Cambridge, to which he added a *Historical Essay on General Councils*. In 1677 his most important tractate, the *Account of the Growth of Popery in America* from 1649 to 1669, was printed at Amsterdam, the title-page says; in 1678 his defence of the Nonconformist John Howe; and to complete the list his voluminous correspondence with his constituents should be added. All these works were printed in his lifetime with a preface by his widow, Sarah Cooke, the editor of a new edition in 1726, denounced as the work of an impostor, an aspersion disposed of by the letters of administration granted in 1679 to *Marvin Marvell, relate ton*.

As a poet Marvell belongs ultimately to his time, and if he did, as some say, write his poems seem to have been written during his residence with Fairfax, and all, clearly, before he entered public life. 'A witty delicacy,' as Lamb called it, and a certain classical turn of expression that betrays the scholar, give a peculiar character to his poetry, but unquestionably his distinguishing characteristic as a poet is his genuine, hearty enjoyment of nature, of which, perhaps, no English poet between Chancer and Wordsworth had so large a share.

The only complete and accurate edition of Marvell's works is that of Dr Grosart, in 4 vols. 1872-74. The edition by Captain Thompson (3 vols. 4to, 1776) printed for the first time the poems on Cromwell, in one of agitator enthusiasm which was the death of Charles I. For Thompson's absurd claim of poems by Aldison, Mallet, and Dr Watts, see the *Corinthi* for 1699. There is an admirable selection by G. A. Atkyns (1882).

**Marwer.** See JODIPUR.

**Marx.** KARL, the founder of international socialism, was born at Trier, 5th May 1818. His father was a lawyer in that town, and the young Marx was sent to the universities of Bonn and Berlin to study with a view to the same profession; but he seems really to have devoted his time to history and philosophy. He was apparently a man of great ability and a decided ambition to settle at Bonn as a lecturer on philosophy. Marx, however, soon gave up the idea of following an academic career, and in 1842 undertook the editorship of the democratic organ, the *Rhenish Gazette*. His experience on the journal convinced him that his economic knowledge required encouragement; and after his marriage he proceeded in 1843 to Paris, the headquarters of revolutionary economics. In the *Deutsch-Französische Jahrbücher* he began that course of literary activity which, varied by political revolution, occupied the work of his life. Expelled from France in 1845, he settled in Brussels, where amongst other productions he wrote his attack on Proudhon's *Philosophie de la Misère*, entitled *Märte de la Philosophie*.

But his chief work at Brussels is the remaining one, along with the *Engels*, of the Communist League, for which he wrote the famous *Manifesto* (see *INTERNATIONAL*). In 1848 Marx took an active part in the revolutionary movement on the Rhine, and after its failure finally settled in London in 1849. Here at the British Museum he acquired his marvellous knowledge of economic literature, and of the economic development of modern Europe. The early fruits of his labour appeared in a work, *Zur Kritik der politischen Oekonomie* (1859), the theories of which were, however, carried forward by the *Capital*. It was in the year of his death that year Marx had, in 1864, resumed his work as agitator. He had the foremost part in founding and directing the International, and after the death of Lassalle he won practical control of the social-democratic movement in Germany. He died in London, 14th March 1883.

Marx's works leave us in no doubt that he was a man of extraordinary knowledge, which he handled with masterly skill. To one who has taken the pains to understand his terminology his style is lucid and powerful, though always full of times ten of the lucidities of his exposition; and the march of thought is varied by humour, unsurpassing invective, and flashes of light from the most unexpected quarters. Since the beginning of literature few books have been written like the *Capital*. It is a volume that Marx's contemporaries were afraid to offer any definitive judgment on his work as revolutionary thinker and agitator, because that is still very far from completion. There need, however, be no hesitation in saying that he, incomparably more than any other man, has influenced the labour movement of the world. His ideas have in a thousand ways already penetrated the different strata of society, even the highest, but most of all the working-classes. 19
may also be safely said that his views can have any hope of realisation only after very extensive modification. In many respects his analysis of the economic development of modern society has been justified by subsequent events, but in many also it has been falsified; and it could be shown that he has left out of account some of the decisive factors in social development.

As he tells us in the preface to the Kapital, the final aim of his great work is to reveal the economic law that moves modern society. The social development of modern times depends on capital; the development of this in its innermost condition is the culmination, and final catastrophe of capitalism. But the full development of capital and of the class representing it involves the rise of socialism and of the proletariat. The great work of Marx, therefore, gives us an historical analysis of capital and by implication a forecast of socialism.

The development of capitalism depends on the appropriation and accumulation of surplus value; we cannot understand the nature of capitalism without understanding surplus value. With the analysis of value, therefore, the great economists of the 19th century were left behind. Marx began his study of modern society, in which the capitalistic method of production prevails, appears as an enormous collection of commodities, which are exchanged one against another in the utmost variety of ways. But they have one thing in common; they are the product of human labour. The value of all the commodities that circulate in the world-market is constituted by human labour, and measured in human labour-time; not this or that individual labour, but the average labour of the community, under the normal social conditions of production, with the average degree of skill and intensity of labour.

But labour cannot be carried on without the means of labour, which are land and capital. Taking England as the classic example of the fully-developed capitalism, Marx shows that since medieval times the course of historic evolution has tended to render the instruments of labour the monopoly of a special class. It is clear that the rise of such a class has had as complement the rise of another class who are destitute of the means of expressing their labour, and who must sell their labour at the wage it can obtain in the market. They accordingly sell their labour for a wage, which represents the average subsistence necessary for themselves and the children required to continue the supply of labour. Their labour, however, when utilised by the capitalist produces a value greater than their wage. This is the surplus value of Karl Marx. The growth of capitalism depends on the appropriation and accumulation of this surplus value; and the history of modern society is a history of the antagonism of the two classes concerned—of the capitalist class, who absorb surplus value, and of the proletariat, who produce it.

The progress of the conflict leads to many remarkable results. On the one hand the great capitalist grows on destroying the old order, until the wealth of the world is concentrated in the hands of a few colossal capitalists. On the other hand the development of the capitalistic system causes degradation, demoralisation, misery, and pauperism among the labouring classes, but it at the same time sets free the productive powers, and lifts above all it raises them to a clear consciousness of their class position. In this way the process goes on in obedience to its own inherent laws, wealth accumulating at one pole of society and wretchedness at the other, and the class conflict is ushered in by an excess of the squalor of existence on which it grows.

tive, and seizing possession of the means of production carry on the economic process for the good of all. Government—which has always hitherto been an arrangement for keeping the producing classes in subjection—will simply become a control of production by the proletariat.

As understood by Marx, socialism does not propose utopian schemes, nor even does it seek particularly to offer programmes of social reform. The great aim of his teaching is to understand a process of historical transformation which proceeds before our eyes: scientific socialism is one conscious and determined effort to oppose this process by agitation and revolutionary action. A change of this character is all the more certainly inevitable in so far as they comprehend and co-operate with the inevitable tendencies of social evolution. The change contemplated by socialism is an economic revolution brought about in accordance with the natural laws of historic evolution. We must also remember that Marx regards the economic factor as cardinal and decisive in history. Law and politics, religion and philosophy, are all moulded and controlled by the prevailing economic conditions. With the term 'materialism' and its materialistic conception of history. According to Hegel, the thought-process, which he transforms into an independent subject under the name ideal, is the creator of the real, which forms only its external manifestation. With me, on the contrary, the thought-process produces nothing but the material transformed and translated in the human brain.' In short, the system of Marx is an evolutionary and revolutionary socialism, based on a materialistic conception of the world and of human history. He seeks to change the economic basis of society, and thereby to change the whole structure, but only by a conscious participation in, and willing co-operation with, historic tendencies, which in themselves are inevitable.

In his later and mature productions so far as published Marx has not given any definite forecast of the form he would be, as the new society, and indeed has expressly disavowed any wish to provide a recipe for social betterment. The responsibility for a development in detail like that made by Schäffle in his Quintessens des Socialismus rests entirely with the author of that work. As already indicated, Marx's views have been moulded by a historical process which is inevitable, to make it clear to the consciousness of the class most profoundly interested—the proletariat, and as far as possible to shorten and alleviate the pangs of this great social revolution. In any case it will come to the birth when its time is fulfilled. Thus regarded, the life and work of Marx have a notable unity and reach and fixity of purpose. All that he did and wrote as scientific economist on the one hand and as agitator on the other, though at first sight inconsistent, is really formed and animated by the one idea.

The leading works of Marx have been mentioned in the foregoing article; a 3d edition of his Kapital, vol. 1, appeared in 1881; vol. ii. was published under the editorship of Dr. Engels in 1883. Most recent economic studies have come from the pen of Gross (Leip., 1885) and Adler (Tübingen, 1887), and The Student's Marx by Dr. Aveling (1892).

Mary (Heb. Miriam, Gr. Maria or Miriam), 'the mother of Jesus' (Matt. ii. 11 ; Acts, i. 14), sealed the New Testament with her prophecies. She sang the solemn Hallelujah of the Redeemer according to the flesh, held in high honour by all Christians; and her intercession is invoked with a higher religions worship and a firmer confidence than that of all the other saints, not only in the Roman Church, but in all the Christian churches of the East. Of her personal history but few particulars are recorded in Scripture. Some details are filled up from the works of the early
MARY

MARY I. 73

Fathers, especially their commentaries or deductions from the scriptural narrative, some from the apocryphal writings of the first centuries, and some from medieval or modern legendaries. The genealogy of which the chief is that in Gen. 5 through Joseph (q.v.); and, as it is plainly assumed that Mary was of the same family with her husband Joseph, the evidence of the descent of the latter from David is equivalent an evidence of the origin of Mary from the same royal house. But the genealogy of which the chief is that in Luke, is commonly held to be the proper genealogy of his mother in the flesh, Mary. The incidents in her personal history recorded in Scripture are few in number, and almost entirely refer to her relations with our Lord. They will be found in Matt. i. ii., xii.; Luke i. ii.; John ii., xii.; and Acts, i., where the last notice of her is of her 'persecuting in prayer' with the disciples and the holy women at Jerusalem after our Lord's ascension (Acts, i. 14).

The apocryphal gospels entitled ' The Gospel of the Nativity of Mary,' and the ' Protoevangelion of the Birth of Christ,' contain some additional, but, of course, unauthentic particulars as to the lineage, birth, and early years of Mary, among which is the miraculous story of her betrothal with Joseph, immortalised by the pencil of Raphael. As to her later life, the traditions of the Church are at variance, and differ widely. A letter ascribed to the Council of Ephesus speaks of her as having lived with John at that city, where she died, and was buried. Another epistle, nearly contemporaneous, tells that she died and was buried at Jerusalem at the foot of the Mount of Olives. Connected with this tradition is the incident which has so often formed a subject of sacred art, of the apostles coming to her tomb on the third day after her interment, and finding the tomb empty, but exhaling an 'exceeding sweet fragrance.' On this tradition is founded the belief of her having been assumed into heaven, which is celebrated in the festival of the Assumption (q.v.). The date of her death is commonly fixed at the year of our Lord 63, or, according to another account, the year 48. Another tradition makes her live the remainder of her life, the remaining years of the first century, in the East.

Of theological questions regarding the B.V.M. (Beata Virgo Maria), one is treated at IMMATURE CONCEPTION. The perpetual virginity of Mary is not explicitly attested in Scripture, and there are even certain ambiguous phrases which at first sight seem to express it. 'Of age, of her motherless son,' born of her after the birth of Jesus, as that of his being called (Matt. i. 25; Luke, ii. 7) her 'first-born son,' and that of James and others being more than once called 'brothers of the Lord;' for which see Joseph. The perpetual virginity of Mary is held as a firm article of belief in the Roman and Eastern churches.

Mariolatry (Gr. Maria, and latreia, 'adoration') is the name given by polemical writers to the worship paid by Roman Catholics to the Virgin Mary. It is intended to imply that the Catholic worship of the Virgin is the supreme worship of latreia or adoration, which Catholics earnestly disclaim, although, from her relation to our Lord, they hold her worship, which they style hyperlatreia, to be higher than that of all other sanctities. The object of Mary (such as the ' Litany of the Sacred Heart of Mary'), of acts of worship done in her honour, and of expressions employed regarding her, are alleged by controversialists, for the purpose of showing that the worship of Mary in the Roman Church is in effect 'adoration.' To the objections Roman Catholics reply that many of the objects of prayers and devotional practices are entirely non-authored by the church, and that some of them are undoubtedly liable to misinter-

pretation; but they further insist that all such prayers, however worded, are to be understood, and are, in fact, understood by all Roman Catholics, even ordinarily acquainted with the principles of their faith, to be directed to the intercession of Mary, and as expressions of reliance, not on her own power, but on the efficacy of her prayers to her Son.

Although no trace is found in the New Testament of any actual worship of the Virgin Mary, yet Romans VIII. 3, Luke i. 49, have been considered as sufficing for an ascription of the angel Gabriel, who saluted her as 'full of grace,' or 'highly favoured,' and as 'blessed among women,' and her own prediction in the canticle of the Magnificat, that 'all nations should call her blessed' (Luke, i. 48), as a foreshadowing of the practice of their church; and they rely equally on the language employed by the early fathers, as, for instance, Irenæus, regarding the Virgin, although Protestants consider it as having reference to the Incarnation. But it seems quite certain that during the first ages the invocation of the Virgin and the other saints must have held a subordinate place in Christian worship; the reason for which, according to Roman Catholics, was probably the fear which was entertained of reintroducing among the recent converts from paganism the polytheism of their forefathers. But from the time of the triumph of Christianity in the 4th century, the traces of it become more apparent. St Gregory Nazianzen, in his panegyric of the virgin martyr Justinus, tells that in her hour of peril she 'implor'd Mary the Virgin to come to the aid of virgin in her danger.' But it was only after the heresy of Nestorius that the worship of Mary seems to have obtained its full development. His denial to her of the character of mother of God, and the solemn affirmation of that character by the ecumenical council of Ephesus (430 A.D.), had the effect at once of quickening the devotion of the people and of drawing forth a more marked manifestation on the part of the church of the belief which had been called into question. The 5th and 6th centuries, both in the East and in the West, exhibit clearest to the eye the development. The writers of each succeeding age till the Reformation speak with gradually increasing enthusiasm of the privileges of the Virgin Mary, and of the efficacy of her functions as a mediator with her Son. St Bernard, and, still more, St Bonaventura, carried this devotion to its highest possible pitch of light. The institution of the ' Rosary of the Virgin Mary,' the appointment of a special office in her honour, and, more than all, the fame of many of the sanctuaries which were held to be especially sacred to her worship gave a prominence to the devotion which Protestants find it difficult to reconcile with the honour which they hold due to God alone. The chief festivals of the Virgin, common to the Western and Eastern churches, are the Conception, the Nativity, the Purification, the Annunciation, the Assumption, and the Dormition. The Roman Church has several other special festivals, with appropriate offices—all, however, of minor solemnity. For accounts of representations of Mary in Art, see MADONNA, PIETA.

Mary I., Queen of England, daughter of Henry VIII. By his first wife, Catherine of Aragon, was born at Greenwich on 16th February 1516. She was in her youth a great favourite with her father, and at the age of seven was betrothed to the Emperor Charles V. In her tenth year she was sent with certain commissioners and a species of engineers to Norway to carry out measures for the better government of the country. She was well educated, a good linguist, and fond of music. She was virtuous and pious, devoted to her mother, and devoted to her church.
MARY I.

With the divorce of her mother her troubles began. Henry treated her with great harshness, and even forced her to sign a declaration that he was supreme head of the church, and that her mother's marriage had been "by God's laws and man's law incestuous and unlawful." During the reign of her brother Edward, she lived in reduced circumstances, and no threats could induce her to conform to the new religion.

On the death of Edward (6th July 1553), she became entitled to the crown by her father's testament and the parliamentary settlement. The Despens and Howard, who had taken Edward, induced Edward and his council to set Henry's will aside in favour of Lady Jane Grey, to whom the duke had married his son Guildford Dudley. Lady Jane was proclaimed on 10th July, but the whole country suspected Northumberland and favoured Mary, who, supported by her friends, was able without bloodshed to enter London on 3d August in triumph. The queen now showed remarkable leniency towards her opponents. Northumberland and two others were executed as traitors, but Lady Jane and her husband were, for the present, spared. She had preserved both their lives in London, and she worked to restrain consciences, and she proceeded very gradually and cautiously to bring back the old religion.

She reinstated the Catholic bishops and imprisoned some of the healing Reformers, but dared not restore the apostolic authority and retain it under the advice of Gardiner, the title of supreme head of the church. Cardinal Pole was immediately on her accession designated papal legate, but prudence and the counsel of the emperor prevented his entering England. The question of the succession, however, turned on the queen's marriage. Some thought of Courteney, Earl of Devon; others, of Cardinal Pole, then only in a deacon's orders; but the queen, in the face of the fears and protests of the nation, obstinately and morbidly set her heart on Philip of Spain. The unpopularity of the proposal brought about the rebellion of Wyatt and an attack upon London. The rebellion was quelled mainly through the courage and coolness of the queen, but the consequences of her easy triumph were fatal to her. The hapless Lady Jane, who had served her queen so well, was signified for the gross behaviour of her friends, was with difficulty induced to leave her husband and father brought to the block. The Princess Elizabeth was suspected, but without proof, of complicity in the treason, and was committed to the Tower. Injunctions were sent to the bishops to enjoin the people to declare allegiance to her, and to stop sympathy from Henry VIII. In July 1554, twelve months after her accession, Philip landed and was married to Mary at Winchester. In the November following Pole entered England, and parliament, having made it sure that restitution would not be exacted from the owners of the confiscated church property, consented to petition for reconciliation to the holy See, and the realm was solemnly absolved from the papal censures. Soon after, the savage persecution which gave to the queen the name of 'Bloody Mary' began. In 1555 Ridley, Latimer, and other martyrs were brought to the stake, while Cranmer was burned in March 1556, and Pole was consecrated Archbishop of Canterbury in his place. In August 1555 Philip had left England, to return only once more for a few weeks, and Gardiner died in November. Pole was made the Pope's supreme in the councils of the queen, and still the queen was under her close supervision. She insisted on her going to Compton, and was at one time her husband's heart, and with disappointment at her childlessness, she became a prey to the deepest melancholy. Finally the evils which the nation predicted from the Spanish alliance came about. The queen was induced by Philip to enter upon war with France. The war was disastrous, and it was through the French that Calais to England. Mary died 17th November 1558.

See the histories of Linzard and Froude; England under the reigns of Edward VI. and Mary, by P. F. Tyler; Privy Purse Expenses of the Princess Mary, with a memoir by Alice M. Madden, and other books cited at Henry VIII., Elizabeth, Grey (Lady Jane).

MARY II. (1592–94), wife from 1577 of William III. (q.v.).

Mary Queen of Scots was the daughter of James V. of Scotland by his second wife, Mary of Lorraine, daughter of Claude, Duke of Guise (q.v.), and widow of Louis of Orleans, Duke of Longueville. She was born at Linnithgow on the 5th of December 1542. Her misfortunes may be said to have begun with her birth. The tidings reached her father on his deathbed at Falkland, and he burst into tears and exclaimed, "What a time will it be with it!" he muttered, as his thoughts wandered back to the marriage with Braco's daughter, which brought the crown of Scotland to the Stewarts — "it can have no issue, and it will pass with one issue!" Mary became heir to the crown at the age of nine weeks.

Within a year the Regent Arran promised her in marriage to Prince Edward of England, and the Scottish parliament had declared the promise null. War with England followed, and at Pinkie Cleuch the Scots met a defeat only less disastrous than Flodden. But the accession to an English match was unconquençable; they hasted to present the young queen beyond the reach of English arms, on the island of Inchmahome, in the Lake of Menteith, and to offer her in marriage to the eldest son of Henry II. of France and Catharine de Medici. The offer was now in July 1558, a French fleet carried Mary from Dunbarton, on the Clyde, to Roscoff, in Brittany, whence she was at once conveyed to St Germain-en-Laye, and thence to the Dauphin.

Her next ten years were passed at the French court, where she was carefully guarded in the seclusion of the king's family, receiving instruction in the art of making verses from the famous Ronsard. On the 24th of April 1558 she was married to the Dauphin, who was six weeks younger than herself. He was agreed on, on the part of Scotland, that her bastard should be entitled to the title of Queen of Scots; but Mary was further betrayed into the signature of a secret deed, by which, if she died childless, both her Scottish realm and her right of succession to the English crown (she was the great-granddaughter of Henry VII.) were conveyed to France. On the 10th of July 1559 the death of the French king called her husband to the throne by the title of Francis II. The government passed into the hands of the queen's kinsfolk, the Duke of Guise and the Cardinal of Lorraine; but their rule was short-lived. The frail and sickly king died on the 5th of December 1560, when the reins of power were grasped by the queen-mother, Catharine de Medici, as regent for her next son, Charles IX. Mary must have been prepared, under almost any circumstances, to quit a court which was now altogether in her power, and she had taunted with being 'a monarch's daughter.' But there were other reasons for her departure from France. Her presence was urgently needed in Scotland, which the death of her mother, a few months before, had left without a government, at a moment when the Reformation was gaining the upper hand. Her kinsmen of Guise had ambitious projects for her marriage; great schemes
Mary Queen of Scots

were based on her nearness of succession to the English crown; and both these, it was thought, might be more successfully followed out when she was seated on her native throne.

She sailed from Calais on the 15th, and arrived at Leith on the 19th August, 1565, her presence among the English ships of war which Elizabeth despatched to intercept her. Her government began auspiciously. The Reformation claimed to have received the sanction of the Scottish parliament, and if Mary did not formally acknowledge the act, she did not least count to leave affairs as she found them, stipulating only for liberty to use her own religion—a liberty which Knox and a few of the more extreme Reformers denounced as a sin against the law of God. She is said to have rejected the violent counsels of the Roman Catholics; it is certain that she surrounded herself with Protestant advisers, her chief minister being her illegitimate brother, James Stuart, whom she soon afterwards created Earl of Moray. Under his guidance, in the autumn of 1562, she made a progress to the north, which, whatever was his design, and what had been the object of the Earl of Huntly, the powerful chief of the Roman Catholic party in Scotland. For the Chastelard episode, see CHASTELARD.

Meanwhile the courts of Europe were busy with the marriage of Mary to the king of Denmark, the king of France, the Archduke Charles of Austria, Don Carlos of Spain, the Duke of Ferrara, the Duke of Nemours, the Duke of Anjou, the Scottish Earl of Arran, and the English Earl of Leicester were proposed as candidates for her hand. Her own preference was for Don Carlos, the heir of what was then the greatest monarchy in Christendom; and it was not until all hopes of obtaining him were quenched that she thought seriously of any other. Her choice fell, somewhat suddenly, on her cousin, Henry Stewart, Lord Darnley, son of the Earl of Lennox, by his marriage with a granddaughter of King Henry VII. of England. He was thus among the nearest heirs to the English crown, and his claims to the succession were so strong as to have the support of the great body of English Roman Catholics. Except this and his good looks he had no other recommendation. He was weak, needy, insolent, and vicious; his religion, such as it was, was Roman Catholic; his house had few friends and was in a state of anarchy which made his life miserable; and he was three years younger than Mary. Her best friends, both Roman Catholic and Protestant, warned her against him, but in vain. The marriage was celebrated at Holyrood on the 29th July 1565. It was the signal for an insurrection by Moray and the Hamiltons, who hoped to be joined by the whole Protestant party. But their hope was disappointed; and the queen, taking the field in person, at once quelled the revolt, and chased the rebels beyond the Tweed.

Darnley's death was scarcely over when misunderstandings began to arise between her and her husband. Darnley's worthlessness and folly became only too apparent; she was disgusted by his debauchery, and alarmed by his arrogance and ambition. She had given him the title of king, but he failed to make good. She hoped that he would be secured to him for life, and that, if the queen died without issue, it should descend to his heirs. Mary hesitated to comply with a demand which would have set aside the settled order of succession; and what she refused to grant by favour the king prepared to attain by force—murder.

Mary's chief minister, since Moray's rebellion had been David Rizzio, a mean-looking Italian, of great astuteness and many accomplishments, but generally hated beyond the palace walls as a base-born foreigner, a court favourite, and a Roman Catholic. The king and Rizzio had been sworn friends, sharing the same table, and even sleeping in the same bed; but the king was now persuaded that it was necessary to sacrifice Rizzio to secure his designs upon the crown. In this belief, he entered into a formal compact with Moray, Ruthven, Morton, and other chiefs of the Protestant party, undertaking, on his part, to prevent their attainder, or procure their pardon, and to support and advance their schemes for a new Protestant kingdom. The queen, on her part, bound themselves to procure the settlement of the crown upon him and his heirs, and to take and slay, if need were, even in the queen's palace and presence, every one who opposed it. The result of this conspiracy was the murder of Rizzio on the 9th of March 1566, the king leading the way into the queen's cabinet, and holding her in his grasp, while the murderers dragged the poor Italian into an ante-chamber, and, mangling his body with more than fifty wounds, completed what they deemed a justifiable act. When Mary learned of it she seemed not to think of the crime, but to believe against the king as being the chief cause of the deed. 'I shall be your wife no longer,' she told him, 'and shall never like well till I cause you to have an arrow with which the heart I have at this present.' After this flight the Earl of Moray, Rizzio's principal conspirators, Mary was kept prisoner in Holyrood; while the king, of his own authority, dismissed the parliament which was about to forfeit Moray and his associates in the late insurrection. The plot was thus far successful; but Mary no sooner perceived the object than she set herself to work to defeat them. Dissembling her inclination at her husband's treason and the savage outrage of which he had been the ringleader, she succeeded by her blandishments in detaching him from the conspirators, and in persuading him not only to escape with her from their power, but to embark with her for Dunbar, but to issue a proclamation in which he denied all complicity in their designs. The conspiracy was now at an end; Ruthven and Morton fled to England, while Moray was received by the queen; and the king, hated by both sides, became an object of mingled abhorrence and contempt.

It was an aggravation of the murder of Rizzio that it was committed, if not in the queen's presence, at least within a few yards of her person, only three months before the birth of her son (the future James VI) to the prince who became James VI. As that event drew near, the queen's affection for her husband seemed to revive; but the change was only momentary; and before the boy's baptism, in December, her estrangement from the king was greater than ever. Divorce was openly discussed in her presence, and darker designs were not obscurely hinted at among her friends. The king, on his part, spoke of leaving the country; but before his preparations were completed he fell ill at the smallpox at Glasgow, and died on the 9th of January 1567. On the 25th Mary went to see him, and, travelling by easy stages, brought him to Edinburgh on the 31st. He was lodged in a small mansion beside the Kirk of the Field, nearly on the spot where the south-east corner of the university now stands. He was attended daily, and slept for two nights in a room below his bedchamber. She passed the evening of Sunday the 9th of February by his bedside, talking cheerfully and affectingly with him, although she is said to have drooped one remark which she never repeated—namely, that at about that time twelvemonth that Rizzio was murdered. She left him between ten and eleven o'clock to take part in a masque at Holyrood, at the marriage of
a favourite valet. The festivities had not long
ceased in the palace, when, about two hours after
midnight, the house in which the king slept was
blown up by gunpowder; and his lifeless body was
found in the neighbouring garden.

The chief actor in this tragedy was undoubtedly
James Bothwell, a man of affairs (i.e., an un-
scrupulous noble, who, since Moray's revolt, and
still more since Rizzio's murder, had enjoyed a large
share of the queen's favour. But there were sus-
picions that the queen herself was not wholly ignorant
of the plot, and these suspicions could not be
refuted; for what follow.

On the 12th of April Bothwell was brought to a mock-trial,
and acquitted; on the 24th he intercepted the
queen on her way from Linlithgow to Edinburgh,
and carried her, with scarcely a show of resistance,
to Dumfermline. On the 7th of May she was divorced
from the young and comely wife whom he had
married little more than a twelvemonth before; on
the 12th Mary publicly pardoned his seizure of her
person, and created him Duke of Orkney; and on
the 15th—only three months after her husband's
marriage—she allowed the man whom every one
referred to as his murderer.

This fatal step at once arrayed her nobles in arms
against her. She was able to lead an army against
them, but it melted away without striking a blow
on the field of Carberry (15 June), when nothing
was left but to surrender. Bothwell was forced to
surrender herself to the confederate lords. They
led her to Edinburgh, where the insults of the
rable and grief at parting with Bothwell threw
her into such a frenzy that she refused all nourish-
ment, and, rushing to the window of the room in
which she was kept prisoner, called for help, and
showed herself to the people half-naked.

From Edinburgh she was hurried to Lochleven,
where, on the 24th of July, she was prevailed upon
to sign an act of abdication in favour of her
son, who, five days afterwards, was crowned at
Stirling. Escaping from her island-prison (where
she was confined of still-born twins) on the 24th of
May 1568, she found herself in a few days at the head
of an army of 6000 men. On the 12th it was put
and defeated by the Regent Moray at Langside, near
Glasgow, two days afterwards. The writ of habeas
emanities of her best friends, Mary crossed the Sol-
way, and threw herself on the protection of Queen
Elizabeth, only to find herself a prisoner for
life. From Carlisle, her first place of captivity,
she was taken, in July, to Bothwell; from Bothwell
she was conveyed, in February 1569, to Fotheringay;
from Fotheringay she passed to Wingfield,
Cromarty, Chatsworth, Sheriffden, Buxton,
Chartley, and last of all to Fotheringhay. The
presence of Mary in England was a constant source
of unrest to Elizabeth and her advisers. A
large minority in the country were still Catholic,
and naturally looked to Mary as the likely restorer
of the old faith. Plot followed plot, therefore,
to effect her deliverance, and to place her on the throne
of Elizabeth. Of these plots the most famous is
that of Percy, who was arrested for his part in
the assassination of Elizabeth and the deliverance
of Mary. The conspiracy was discovered; cer-
tain letters of Mary approving the death
of Elizabeth fell into the hands of Walsingham;
and a few days after the delivery of these
texts, Mary was brought to trial in September
1566. Sentence of death was pronounced against
her on the 26th of October; but it was not until
the 1st of February 1567 that Elizabeth took
courage to sign the warrant of execution. It was
carried out immediately, and the 8th of February
Mary laid her head upon the block with the dignity of a
queene, and the constancy and resignation of a martyr,
even to the last her devotion to the church of
her fathers. Five months afterwards her body was
buried with great pomp at Peterborough, whence,
in 1612, it was removed to King Henry VII.'s
Chapel at Westminster, where it still lies in a
sumptuous tomb erected by James VI.

The character of Mary was that of the most
forwarded princess of her time, and is still in
debate, although the great preponderance of
authority seems now to be on the side of those who
believe in her criminal love for Bothwell and
her guilty knowledge of his conspiracy against
her husband's life. Her two achievements have
never been disputed. She was con-
fessed by every one to be the most charming
princess of her time. Her large sharp features
might perhaps have been thought handsome rather
than beautiful, but for the winning vivacity and
high jovous spirit which animated them. It has
been questioned whether her eyes were hazel
or dark gray, but there is no question as to the
star-like brightness. Her complexion, although fresh
and clear, would seem to have been without the
brilliance so common among our island beauties.
For her eyes are said to have varied from
a ruddy yellow to auburn, and from auburn to
dark brown or black, turning gray long before its
time. Her bust was full and finely shaped, and she
carried her large stature figure with majesty and
grace. She showed to advantage on horseback, and
when as a princess she had to have her
voice is described as irresistible; and she sang well,
accompanying herself on the lute, the virginal,
and still oftener on the lute, which set off the
beauty of her long, delicate, white hand.
The consciousness how that hand was admired may
have made it more difficult in knitting and
embroidery, in both of which she excelled. Her
manners were sprightly, affable, kindly, frank per-
haps to excess, if judged by the somewhat austere
rule already beginning to prevail among her
Scottish subjects. She spoke three or four lan-
guages, was well and variously informed, talked
admirably, and wrote both in prose and in verse,
always with ease, and sometimes with grace or
glory. In the ring of which she was the centre
were statesmen like Moray and Lodgington, sol-
iers like Montagu, the Blacksmith, and especially
Buchanan, Leslie, Sir Richard Maitland, and Sir
James Melville. The first poet of France published
verses depicting his absence from her brilliant
court; Danville, the bower of French chivalry,
replied at the fate which called him away from
her love. Before our last, he has been so
severely delighted to speak, in old age, of the days
which they passed beneath its roof.

Mary's prose-writings have been collected by the
enthusiastic devotee of Prince Alexander Labouf,
in his Recueil des Lettres de Marie Stuart (Vols.
1844). Setting aside the twelve so-called 'sonnets'
which she is said to have written to Bothwell, and
which survive only in a French version of an
English translation, no more than six pieces of her poetry
containing in all less than 300 lines, are now known.
They have no remarkable merit. The best is the
poem in fourteen stanzas on the death of her first
husband, Francis II., printed by Brantôme. The
longest is a Meditation of a hundred lines, written
in 1572, and published two years afterwards by her
ever faithful follower, Bishop Leslie of Ross. All
are French, and there is that one only, which is in Italian.
The sweetly simple lines beginning 'Adieu que je n'ai'
ne paye de France,' so often ascribed to her, are
probably the work of A. G. M. Meunier de Querlon, a
French journalist, who died in 1783. A volume of
French verse on the Institution of a Prince, which
she wrote in 1567, has been in use of her son for
1567, along with a Latin speech in vindication of
learned women, which, when no more than thirteen,
Maryland and Delaware
MARYLAND

The delivered in the hall of the Louvre, in presence of the French court.

To enumerate all that has been written on Mary would fill a volume, among the chief works are Jobbe's De Vita et Rebus Gestis Marinor Scotorum Regnum (1725); J. Anderson's Collections Relating to the History of Mary, Queen of Scotland (1727); Bishop Tytler's History of Scotland (1734; new ed. 1814-30); W. Goodall's Examination of the Letters said to be written by Mary, Queen of Scots, to James, Earl of Bothwell (1754); Principal Robertson's History of Scotland (1750); Sir William Flandru's Rebus Veil (1791); and the following (q.v.).

Lines of the Queen of Scots (1802-3); ed. 1853; A. de Montaigne's Latin Names of Mary Stuart (1855); Prince Lebass's Notice sur la Collection des Portraits de Marie Stuart (1856); Mignet's Histoire de Marie Stuart (1858); Teulet's Lettres de Marie Stuart (1861); Chauveau's Marie Stuart et Catherine de Medicis (1858); Joseph Robertson's Catalogue of the Jewels, Furniture, Furniture, Books, and Paintings of Queen Mary (1863); Hosack's Mary, Queen of Scots (1868); ed. 1881; and others.

The most important documentary work on Mary is that of Pet. de Flandre (1786), published by the editor, and the interesting document by Claude Nau, her secretary (ed. by Father Stevenson, 1851). In the field of biographical writing, Mary Stuart, Caroline E. Barron's Alphabetic Researches (1869), and the First English Woman of Letters (1870), are the most important contributions.

The best representations of Mary are the contemporary portraits by the French painter, Francois Boucher, and the modern portrait by an unknown sculptor, on her tomb at Westminster. All portraits which cannot be reconciled with these types may safely be rejected as spurious.

Maryborough, a port of Queensland, on the Mary River; is connected by a wooden bridge, 25 miles from its mouth and 180 N. of Brisbane, with which there is communication by steamer and coach. The wharves admit vessels drawing 174 feet. Gold from Gympie (61 miles by rail) and copper from Mount Perry and other mines, with sugar and tinplate, form the staple exports. There are eight dozen sugar-mills at work in the neighbourhood, and three iron-foundries, and brewing, tanning, and shipbuilding are carried on. Pop. (1891) 9700.

Maryland, a state of the American Union, lying between 37° 53' and 39° 44' N. lat., and 73° 4' and 79° 33' W. long. It contains 12,210 sq. m., or nearly one-fifth of the size of Holland—of which about 63 miles, or one-fifth is water. The length from east to west is 195 miles, and the breadth 128 miles. On the north and east it is separated from Pennsylvania and Delaware by Mason and Dixon's Line (q.v.); on the south it is bounded by the Potomac River, the whole of which, with the exception of about 12 miles in the District of Columbia (q.v.), is under the jurisdiction of Maryland, down to the low-water mark on the Virginia side.

The surface elevation varies greatly, from sea-level to more than 2000 feet, and the west is mountainous (see Blue Ridge); in the middle hilly and rolling; and in the east south-east low and undulating. A line drawn from the month of the Susquehanna to the city of Washington will cut the state into two nearly equal parts, and divide the mountain and hill country from the lowlands on both sides of the Chesapeake Bay. The

The productions and occupations are largely determined by the physical features—in the west coal and timber; in the middle corn and wheat; in the east fish, fruit, and vegetables. The climate is generally regarded as unusually healthful. The mean summer temperature is 75°, the mean winter temperature 44°. The annual rainfall varies from 48 inches in the mountains to 46 inches near the Atlantic coast. The mountain air is regarded as specific for hay-fever. The prevalent diseases on the shores of the Atlantic and the Chesapeake Bay were formerly bilious and intermittent fevers of a mild form, and they still exist to some extent in these districts.

The geological formations vary with the surface elevations. The southern section of both the eastern and western shores is alluvial; north of the alluvial deposit is a tertiary formation; north-west of this come metamorphic rocks; west of them a wide belt of alluvial and Devonian formation; and still farther west Carboniferous strata beginning at Cumberland. In the Tertiary we find marl in abundance; in the metamorphic rocks gneiss, granite, limestone, and iron; in the Carboniferous extensive veins of bituminous coal of various kinds; and in the Silurian and Devonian the George's Creek district is 14 feet thick. Over 200 kinds of marble have been found in the state, some of them equal to the Italian marbles. Copper mines are extensively worked in the middle district; and iron, which once belonged to the United States, comes from the same location. Near Baltimore are large beds of clay, from which bricks of peculiar excellence and beauty are manufactured; and in an adjoining county valuable quantities of soapstone are worked with profit.

The soil is well suited to agriculture, with the exception of the mountain tops in the west, and a small proportion of marsh land in the east, which might, however, be easily and profitably reclaimed. The forest-trees are principally pine, chestnut, and oak; hickory and walnut are becoming scarce. The staple fruit-tree is the peach, which covers many thousands of acres; Maryland peaches, preserved in air-tight cans, are exported to all quarters of the world. Tobacco is the principal crop in the peninsula between the Chesapeake and the Potomac, as in Virginia; the farm crops are the settled, constituting even their ordinary medium of exchange. Tomatoes, melons, small fruits, and all kinds of vegetables are cultivated on the eastern shore and sent to the markets of Baltimore and Philadelphia. The mountains still contain many deer; and wild geese, swans, and turkeys are found in considerable numbers at the proper season, as well as woodcock, grouse, and quail (locally called partridge). Immense flocks of wild ducks of various species throng the estuaries of the Chesapeake on the approach of cold weather; the 'canvas-back' is found nowhere else in perfection.

The Chesapeake Bay (q.v.) divides Maryland into two unequal portions, the Eastern and the Western Shore. With its estuaries it gives the state a coast-line of more than 500 miles, and almost that number of steamer landings; on the Eastern Shore there is scarcely a farm more than 5 miles distant from a navigable river, accessible to steamboats of light draught. Shad and herring are caught in large numbers, and the average annual supply of oysters reaches 20 millions of bushels, giving employment to over 100,000 persons. For the leading manufactures, see BALTIMORE, where most are located. Baltimore is also the principal port and great commercial centre of the state. Maryland has about 1300 miles of railway, and two canals (from Cumberland, in the west, to Washington, 1843 miles, and between the Chesapeake and Delaware Bays, 124 miles).
Maryland has a well-developed system of free public schools. In 1885-90 there were in attendance 219,362 pupils, with 4616 teachers (salaries $1,790, 740.82), the total expenses for public school purposes being for the year $2,459,255.09. There is in Baltimore a state normal school, and in every county a high school or academy. The colleges supported in whole or in part by the state are St. John’s College, Annapolis (originally King William’s School); Washington College, Chestertown, Kent county, to the foundation of which George Washington contributed $100 sterling; the Agricultural College, near Frederick, and Western Maryland College, Westminster. There are also several denominational colleges. The foremost of the educational institutions of Maryland is the Johns Hopkins University, in Baltimore. There is a school for the feeble-minded at Pikesville; a school for the deaf and dumb at Frederick; and in Baltimore a school for the blind, and a school for colored blind children and deaf-mutes, all supported by the state at an annual expense of about $60,000. The asylum for the insane at Catonsville is admirably managed.

Maryland returns six members to congress. The Legislature is styled the General Assembly, and consists of two houses—the Senate and the House of Delegates. The Senate is composed of one member from each of the twenty-three counties and one from the city of Baltimore, elected by the people. The House of Delegates has nineteen members, and the remainder from the counties in proportion to their respective population. The seat of government is at Annapolis. Baltimore had in 1900 a pop. of 608,987. The other large towns are Cumberland, Hagerstown, Frederick, Westminster, on the western shore; Salisbury, Easton, and Cambridge, on the eastern. Pop. (1890) 447,009; (1890) 393,934; (1890) 1,188,044.

History.—In 1632 Charles I. of England issued a patent to Cecil Calvert, Lord Baltimore, granting him all the land from Watkins Point on the Bay, northward to the 40th degree of latitude, and from the Atlantic Ocean and Delaware Bay on the east to the Potomac River on the west. This grant included the whole coast of Maryland, but also parts of Pennsylvania and Delaware. The first settlers, who came in June, 1633, were 127 men and women. They were adventurers in search of gold, and a few persons of other trades. They experienced many vexatious disputes, some of which were settled only in 1890. The district was named in honour of Henrietta Maria, Charles’s queen. In March 1634 a party of English gentlemen and their servants and indentured servants, led by the chief committee of the Maryland Calvert, a brother of Lord Baltimore, landed on the shore of a river now called St. Mary’s, a branch of the Potomac, and bought from the Indians a tract of land. The friendly relations thus commenced with the Indians, and but rarely interrupted, together with the toleration and protection accorded to all shades of Christian belief, led to the rapid and peaceful growth of the new colony. Maryland was one of the first of the colonies to take an active part in the Revolution. During the civil war many were divided, but the state held to the Union; the battle of Antietam (or Antietam) was fought (1862) in Maryland. See J. T. Scharf, History of Maryland (3 vols. Baltimore, 1879).

Maryport, a seaport of Cumberland, at the mouth of the Potomac, 28 miles SW. of Carlisle by railway (1837). The town is named from the fact that Mary Queen of Scots landed here on her flight from Scotland, though it was called Ellenfield down to 1790, when its harbour was constructed. A new dock was opened in 1881. Shipbuilding and employed connections are carried on, and there are iron-foundries and iron-furnaces, sawmills, flour-mills, tanneries, breweries, &c. The annual value of the total exports, chiefly coal, is from $70,000 to $550,000; the imports of foreign and colonial merchandise include from $70,000 to $150,000. The average number of vessels entering the harbour is about 1500 per annum, of some 220,000 tons burden. Pop. (1851) 5068; (1891) 8784.

Marysville, capital of Yuba county, California, on the Yuba River, at the head of navigation, 52 miles by rail from Sacramento. The chief exports are gold-miners, and though somewhat declining, has an extensive trade, and contains flour-mills, a foundry, woodpen factory, &c. Pop. (1900) 3497.

Masaccio, a Florentine painter, whose proper name was TOMMASO GUIDI, was born in 1401 or 1402 in the Arno valley, probably at Castel San Niccolo near Lucca. His earliest works are of gold-miners, and though somewhat declining, has an extensive trade, which is due to the work he did in the church of St. Clement. But his greatest achievements were wrought on the walls of the Carmine church, especially in the Brancacci chapel. It has been matter of controversy as to which pictures were precisely from the brush of Masaccio; Masolino’s contribution is at the same walls before he and Filippino Lippi after him. Those which are assigned to him beyond doubt or question are ‘Expansion from Paradise’ (greatly admired by Raphaël, who repeated the design in the loggia of the Vatican), ‘Peter and the Tribune-money,’ ‘Temptation of Adam and Eve,’ ‘Peter Preaching,’ and the same saint ‘Baptizing,’ ‘Healing the Sick,’ ‘Giving Alms,’ and (in part) ‘Restoring the Young Man to Life.’ These works mark an advance in Italian painting, in that they exhibit more religious and correct representation of nature, with improved perspective and harmony of arrangement between the figures and the background. Many of the subsequent 15th-century painters of Italy were greatly influenced by the study of them. Towards the end of 1429 Masaccio was living in Florence, and is reported to have gone to Rome and to have died there before the year 1429 ran out.

Masai, a people of East Equatorial Africa, dwelling in a district that stretches from 1° N. to 5° S. lat., and from 34° to 38° E. long., and includes Kilimanjaro, Kenya, and Lake Baringo. The southern half of the district is low and barren, with no rivers and little rain. whilst in the north it rises into a plateau-region (5000 to 9000 feet), rich in running streams, forests, and grass-land. The Masai are not a Negro or Bantu race; they resemble the Galli, being men of magnificent stature and Apollo-like forms, though their faces are ugly and ferocious. Their hair is black. They have ungainly habits of their youth, when, for nearly a score of years, they live in military kraals, spending their time in alternate idleness and on the war-path, eating nothing but beef, drinking nothing but milk, and having indescribable intercourse with the unmarried girls of the tribe. After marriage, which takes place when they lay aside the habits of the warrior, they settle down as cattle-breeders. The arms of the warriors consist of an ox-hide shield, a spear with a blade 2 to 2½ feet long and 3 inches broad, and a club shaft of 15 inches, a sword, and a knobkerrie. They are men of an aristocratic race, and clever public speakers. The work is done by slaves and by the women and boys. They speak a Hamite language. See Joseph Thomson, Through Mount Land (1885), and compare H. H. Johnston, Kilimanjaro Expedition (1899).
Masaniello (properly Tommaso Anello), a fisherman of Naples, born in 1623, was the leader of the revolt which took place in Naples in July 1647 against the Spanish viceroy, the Duke of Arecis. The people had been exasperated by oppression, and great excitement had been produced by a new grape fruit. Masaniello himself was aggrieved by the harsh treatment which his wife had received after being detected in an attempt to smuggle a little flour. Taking advantage of a quarrel between the fruit-sellers and the tax-collectors, Masaniello stirred up the multitude to a revolt. Their triumph was complete; palaces and public buildings were plundered, mostly for arms, a bloody popular justice was executed, and the viceroy was forced into a regular treaty with Masaniello in the church of the Carmelites on 13th July.

Masaniello died in prison on 16th July.

Mascagni, Pietro, composer, born 7th December 1863, at Leghorn, produced, after a somewhat interrupted education, the successful one-act opera Cavalleria Rusticana in 1890, in competition for a prize, the plot being taken from a story by Verga (q.v.). Later operas were L'Amico Fritz (1891, based on Erckmann-Chatrian), I Rondine (1892), Nerone, besides songs and ballads.

Mascara, a town of Algeria, 50 miles S.E. of Oran, on a slope of Atlas. Pop. 14,767.

Masarenes. See Mauritius.

Mashan, Mrs. See Marlborough.

Mashonaland, or Mashukaland, the name of the region lying north-east of Matabeleland, between 16°30' and 19°10' S., lat. and 30° and 32° E. long. It embraces the plateau (4000-4600 feet) whose backbone is formed by the Unyenvwe Mountains, and in which some of the chief feeders of the Zambezi, Limpopo, Sabi, and Mazoe have their origins. It is reported to be the healthiest part of South Africa. The soil is rich with sward grass all the year round, and an abundance of running streams. A constant, cold south-east wind tempers the heat, and renders the air strong and bracing. When their land was invaded by the Matabele, those of the Mashon who escaped massacre took refuge in the mountainous country to the west of them. They maintained themselves, building their villages on almost inaccessible crags. A peaceful and industrious people, of Bantu race, they live in perpetual fear of their fierce neighbours. They are the best husbandmen in South Africa, and before being dispossessed of their country owned large herds of cattle. They now grow rice, Kaffir corn, maize, ground-nuts, sweet potatoes, tobacco, and cotton; this last they weave into blankets. They are also good iron-workers. Iron, copper, and gold (in quantities small) exist in immense quantities in the country.

Mashonaland was discovered by a German traveller, who in 1871 discovered many old mines that had at one time been worked with some degree of scientific skill, especially at a place called Zimbabwe, which he identified with the Ophir (q.v.) of the Bible, and which he supposed to be the seat of the ancient inhabitants of that region with Safala. Mashonaland was put under British protection on 11th February 1888, and was taken actual possession of by the British South Africa Company in August 1890.

The Makalaka are a people closely allied to the Matabele, the Matabele being the southern branch of the tribe. Those who escaped the Matabele live chiefly in the mountain fastnesses in the southern part of Matabeleland, and follow the same occupations and mode of life as the Mashona. The Banyai tribes—likewise refugees from the Matabele—live south-east of the Makalaka, along the middle course of the Limpopo. See books quoted under Matabeleland.

Masinissa, king of the Eastern Numidians, was born about 233 B.C., and brought up at Carthage. Having helped the Carthaginians to subdue Syphax, in the wars in which the Numidians, he accompanied his allies to Spain and fought valiantly and successfully against the Romans. But about 210 the Carthaginians gave his promised bride to Syphax; and for this and other reasons he became lukewarm to the cause of Carthage, and zealously backed up the Romans in their struggle against their African rival. He received as his reward the kingdom of Syphax, together with large portions of the territory of Carthage. But before he died, in 149 B.C., he saw that he had fostered a most dangerous enemy for his own people, the Massyli, and the kingdom he left to his sons, and slackened his zeal for Rome.

Mask (through the medium of Fr. and Span. from the Arabic maskharat, 'a jester') is an artificial covering for the face, worn by many different peoples for different purposes. Masks are common amongst the inhabitants of New Britain, New Guinea, New Holland, New Zealand, and the islands of the Pacific, amongst the North American Indians and the Eskimo, the Chinese, the aboriginals of Australia, and some Negro tribes. The masks these peoples use are generally very hideous and repellent in aspect, being designed expressly to inspire terror in the mind of the beholder. The function of a masquer, therefore, is to scare away the demons and spirits who bring misfortunes, diseases, national calamities, or other evils upon the tribe; the exorcism is usually practised by processions of masked men, who dance and utter loud cries calculated to frighten the enemy away. Where totemistic beliefs prevail, it is customary for the people to celebrate dances clad in the skins of wild animals, and on such occasions masks are worn shaped to resemble the animals represented in the dance. It is highly probable that practices of a similar nature were current amongst the primitive Greeks, Egyptians, and other peoples. The myth of the snaky-haired Gorgon is traced back to this origin; so too is the practice of covering the faces of the dead with a mask, intended to keep the demons away from the body. Similarly, the custom of wearing the mask in processions to the abode of shades, a practice common to the ancient Greeks and Egyptians, and the ancient Peruvians and Mexicans. Death-masks of gold have been found in tombs of Mycene and Kerch; those of the Peruvians were made of silver and wood; some found at Carthage were of clay, painted in divers colours; and copper and wood were used in Mexico. Masks, besides being worn by living men, were sometimes attributed to their gods, as in ancient Egypt and Greece, and in India, or were worn on occasion by gods' images, as in ancient Mexico. The Greeks, moreover, in their theatrical performances, employed masks shaped to represent the expression of a particular emotion or passion, as rage, grief, sly cunning, &c. These, made of linen, tree-bark, leather, or parchment, were fastened to the performers' mouth-openings, for the purpose of giving the voice of the actor a penetrating sound (whence Lat. per-sona = 'a mask'), so that it might be heard all over the vast theatres in which they had to act. Passing on to the Romans, the custom of the masked actor and of the stigmata transmitted by them to the Italian theatres of the middle ages, nearly all the actors in the Commedia dell' Arte wore masks. The custom was also practised in the
through the influence of Gray, who had been attracted to him by his *Museus*, *a poetic lament for the death of Pope* (1744), in imitation of *Lyricus*. He published later two second books; *Elfrida and Caractacaus; the English Garden* (1772-82), a long and tedious poem in blank verse; and the *Memoirs of Gray* in 1775, the serious defects of which have at length been demonstrated to all readers through the painstaking and laborious labours of Mr. Gassau. Masonook and then later also a preface and comments on *York*, where he died 7th April 1757.

**Mason and Dixon's Line** is popularly supposed to have been a line dividing the slaveholding from the non-slaveholding states, and to have run due east and west. In reality it ran for more than one-third of its length between two slave states, Maryland and Delaware, and a small part of it is an arc of a circle. It was run by two English engineers, Charles Mason and Jeremiah Dixon, between the years 1764 and 1767, for the purpose of settling the disputed boundaries between Maryland and the one side and Pennsylvania and Delaware on the other. Their operations were to begin at a easterly point on the Atlantic Ocean, and run due west to a point midway between the Atlantic and the Chesapeake Bay; thence northward, so that the line should become a tangent to the north-western boundary of Delaware, which was afterwards defined from New Castle Court-house as centre, with a radius of 12 miles. The line was then to follow the curve in a westerly direction until it reached a point due north of the point of tangency; thence due north until it intersected a line run due west from a point 15 miles south of Philadelphia, and continued directly to the point intersected a line running due north from the farthest western source of the Potomac River. The work was done with such skill and accuracy that a revision in 1849, with instruments of much greater precision, disclosed no error of importance.

**Masonry**, the art of construction in stone. The earliest existing examples are among the monuments of the ancient Egyptians, who did not use mortar in their important structures, such as the pyramids, the joints being all carefully polished and fitted. Cyclopean masonry, of which remains exist in many parts of Greece and Italy, also exhibits its ability of great strength and soundness, to the joints. The walls of Mycenae are among the earliest examples. These are built with long irregular blocks, the spaces between being filled up with smaller stones. The Etruscan specimens are more carefully executed; the stones are not squared, but they are all carefully fitted together. The masonry of the Greeks and Romans very closely resembled that of the present day: Rubble-work (*opus incertum*), in which the stones are not regularly cased; *Coursed* work, where the courses are all level, and the stones wedge-shaped, or * ashlar*, resembling the latter, but built with larger stones carefully dressed on the joints. The early medieval masonry was of very bad construction, being, in fact, little better than common rubble, with an occasional use of Herring-bone Work. The Germans is borrowed upon the ashlar work, but their masonry was also so bad that many of the towers built by them either fell or had to be taken down. The art gradually improved with the advance of Gothic architecture, and ashlar was re-introduced for all important works. The ashlar work so urgently needed by the Church has given place to the hammer-dressed and squared masonry. Special materials sometimes produce special kinds of work; thus, in Norfolk and Suffolk,
where large flints abound, the walls are often faced with these; split so as to form a clean face and arranged in horizontal bands or panels between stonework or brickwork.

MASPERO, GASTON CAMILLE CHARLES, Egyptologist, was born at Paris, of Italian parents, on 23d June 1816. He began to lecture on Egyptology at the School of Higher Studies in Paris in 1869, and in 1873 was appointed professor of Egyptology at the College of France. In 1881 he founded a school of Egyptian archeology at Cairo, and succeeded Mariette as director of explorations and custodian of the Boulaq Museum. In 1886 he became professor at the Institute of Paris. As an explorer he has excavated or opened the pyramids of the Pharaohs, the tombs of the 5th and 6th dynasties, and the burial-fields of Sakkara and Dahshur, and discovered new sepulchral sites of great value at Del or El-Bahari, near the entrance to the Valley of the Tombs of the Kings, at Luxor, 130 miles S. of Thebes, and at other places. His most valuable work is to all, according to the late Histoire Ancienne des Peuples d'Orient (illus. ed. 1894; trans. as The Dawn of Civilization, 1894); La Trouvaille de Deir el-Bahari, L'Archeologie Egyptienne (1887; Eng. trans. 1887); Contes Populaires Égyptiens Anciens (1892); Etudes Egyptiennes (1879–82); papers in Journal de Travaille, and several other more technical productions.

Masque, a species of dramatic performance, much in vogue in England towards the close of the 16th and the beginning of the 17th century. It was in fact the favourite form of private theatricals at the time. The masque appears to have originated in the practice of introducing, in any solemn or festive processions, men wearing masks, who represented either imaginary or allegorical personages. At first it was simply an ‘acted pageant, as in the well-known progresses of Queen Elizabeth; but gradually it expanded into a regular dramatic entertainment, and in the hands of men like Fletcher and Ben Jonson attained a high degree of literary beauty. Jonson’s masques were represented at court, and were greatly relished. The taste for masques died out under Charles I., to whose reign belong the famous ‘Court Masques,’ and the ‘English Masques,’ edited by H. A. Evans (1897), contains ten pieces by Jonson, and others by Daniel, Campion, Beaumont, Shirley, and Davenant.

Masquerade, or Masked Ball, a festive meeting in which the host and guests assume fictitious characters, and disguise themselves more or less for the occasion, the mask being the derived form of the use of the mask. The public mummeries of former times, Easter plays, Festivals of Fools, &c., which were frequent in most parts of Europe, but somewhat varied in different countries, probably suggested the idea of the masquerade, which, however, was not an all-prevailing, and understood rules of these ancient amusements, but was limited to some select classes, or to those who paid a certain sum for admission. Catharine de Medicis introduced the regular masquerade at the French court. It found its way to England in the reign of Henry VIII., but did not reach any of the courts of Germany till the end of the 17th century. The ball costume is a very modified and much less objectionable form of the masquerade.

Mass, is defined as ‘the quantity of matter in a body;’ and weight is proportional to mass (see gravitation, Matter).

Mass. See liturgy.

Mass, Music of. Each part of the service of the Church had its special mode of singing melody, varying according to the season or festival; the first collections of these melodies were made by St. Ambrose, and afterwards more completely by St. Gregory. But since the invention of counterpart certain portions have been selected for more elaborately treated music, viz., the Masses of Mozart, Beethoven, Palestrina, Beneleotus, and Agnes Dei; each of which, but especially the Credo, is by common tradition divided into separate movements, also designated by the initiatory words. In the early cantata, music of a plain-song melody, or even a secular tune, was inserted, but the rock method was constructed, and the mass was named in accordance—e.g. the numerous Missae L’Homme Armé, founded on an old French love-song. This appropriation of secular tunes, which could never be seriously lost in association with a not easily understandable words, anticipates Shakespeare’s Puritan who sings Psalms to hornpipes,’ and the similar practices of recent revivalists. These compositions soon became more remarkable for their learning and ingenuity than appropriateness or reverential feeling; and to such an extent was this abuse carried that the Council of Trent condemned them in no measured terms, and a commission, appointed in 1564 to carry out certain of its decrees, was on the point of entirely forbidding the use in future of polyphonic music in the church, when the produc- tions of Palestrina and his contemporaries were discovered. Marcelli convinced the cardinals that such music could be profoundly devotional as well as technically skilful; and its use was allowed to be continued. The succeeding epoch of church music, however, was one of decline; but in the later part of the 17th and commencement of the 18th century arose a new school, comprising Alessandro Scarlatti, Leo, and Durante, in whose compositions the introduction of instrumental accompaniment was the most important new feature; one which gave to all subsequent masses the style of the cantata more individual and dramatic than devotional. In this style also are the stupendous masses of Bach in B minor, Beethoven in D, and Cherubini in D and A. Of less importance, though full of beautiful music, are those of Haydn, Mozart, Weber, Schubert, and Gounod.

The name of the Requiem, or Missa pro defunctis, differs of course considerably in its details from that of the ordinary High Mass. The most famous com- position for it are those of Mozart and Cherubini. Brahms’ Requiem, the first of which was constructed, is not a mass but a sacred cantata on scriptural words.

Massa, distinguished as MASSA DI CARRARA, a city of Northern Italy, 20 miles by rail SE. of Spezia. It is a bishop’s see, has a public library, an academy of arts and sciences, a cathedral, and a ducal palace. The inhabitants, 9098 in 1881, rear silkworms, grow tobacco, press oil, make paper, saw timber, and trade in the white marble that all sculptors use. The province of Massa and Carrara has an area of 687 sq. m., and a pop. (1881) of 169,469; (1891) 181,307, In 1568 the ruling family in Massa were created princes, and in 1664 duke, and the dukedom was married by permission to the house of Modena-Este in 1741.

Massachusetts, one of the oldest and most celebrated of the states of the American Union, lies between 41° 14' and 42° 53' N. lat., and between 69° 53' and 73° 32' W. long., and has an area of about 8315 sq. m. It is irregular in outline, its greatest length being 240 miles, breadth 75 miles, and 473 miles. It is bounded on the east by Massachusetts Bay, a part of the Atlantic Ocean, from which the state derives its familiar name of the Bay State. The surface is uneven, varying from low plains, near the sea-coast, containing small lakes, to a rolling country in the interior, becoming mountainous as the western boundary is

318
approached. This mountainous portion is composed of two distinct ranges, being part of the Green Mountains, which extend southward from Vermont (q.v.), and are about 150 miles long and 50 miles wide. The highest of the peaks is Greylock (3505 feet), but most of them are wooded to the summit, and the scenery, while not grand, is of great beauty. The soil is in many portions, particularly in the east, rocky and sterile, and is composed of important yielding granite and syenite, red sandstone, and valuable marble. Along the river valleys, however, and in certain other sections the soil is fertile. In 1890 there were 63,685 horses, 230,128 cattle, 51,438 sheep, and 51,438 swine. The following table gives the chief products and manufacturing establishments and the amount of their value in 1897:

The leading cities of Massachusetts, with pop. in 1890, are: Boston, the capital and chief seaport (590,096); Worcester (118,421), with manufactures in metals and machinery; Springfield (62,039) and Holyoke (45,712), on the Connecticut River, the centre of the paper manufacture; Fall River (104,862), Lowell (94,900), and Lawrence (65,352), devoted to cotton manufactures; Lynn (68,513), Haverhill (37,175), and Brockton (49,063), boat and shoe centres; Salem (35,955) and New Bedford (62,442), both noted seaports of former days and now possessing extensive cotton-mills; Tamworth (31,031), with varied manufactures; Gloucester (20,121), famed for its fisheries; and Cambridge (91,886), near Boston, the seat of Harvard University.

The state debt at the close of 1890 was $26,996,429, protected by a sinking fund of $18,295,237; and an additional debt of $39,134,412, for which certain cities and towns have bonded. Boston has a sinking fund of $28,000,000. (Pop. [1880] 422,845; [1890] 591,954; [1890] 2,238,943; [1900] 2,305,346.)

History. — The coast is supposed to have been visited by Northmen about the year 1000, but the first permanent settlement was made at Plymouth, near Cape Cod, by the Pilgrim Fathers in 1620. The settlement of the Pilgrim Fathers (q.v.), who were separatists from the English Church, and who sailed from Plymouth, England, in the ship Mayflower. This settlement became the nucleus of the Plymouth colony. In 1623 a company of Puritans under Endecott established settlements in the interior of the state. Massachusetts, by local charters, becomes a separate state, and in 1628, the colony of New England is formed by the union of the Pilgrim Fathers, and the old Puritan establishment was virtually continued nearly everywhere. The last vestiges of this union between church and state were not swept away until 1833.

During the early years the colonists suffered great privations from the rigours of the climate, and they were also subjected to troubles with the Indians. They were, however, a hardy and industrious race, and gradually grew in numbers and prosperity. They were involved in the difficulties between England and France in the New World, and in the expeditions against the French in Canada, especially at the first siege of Louisburg (q.v.), the citizen soldiers of Massachusetts performed effective service. After the war of the revolution, begun in Massachusetts, it came to a very high point. In 1893-96 there were in the state 9153 public primary and grammar schools and 297 high schools. These are supported at public expense by taxation — tuition and text-books being furnished free to all who wish them. There were 411 academies and private schools. The amount raised by taxation and paid for all school purposes was $7,360,413, the average attendance of pupils being 321,685. Massachusetts maintains ten normal schools, and there are in the state two technical institutes and twelve colleges and universities, the latter including Harvard, Williams College, Amherst College, and Boston University and College. The single-school system is under state supervision. In 1899 there were 177 such banks in operation, having deposits amounting to $332,170,688; besides 93 co-operative banks or building loan associations, with assets of $1,601,639.

Massafra, a town of the Italian province of Lecce, 11 miles by rail NW. of Taranto. The 968 inhabitants gives wine, and fruits.

Masséna, André, Duke of Rivoli, Prince of Espling, and the greatest of all Napoleon's marshals, was born at Nice, 1758, of Nice, 6th May 1758. He began life as a cabin- boy, and served fourteen years in the Sardinian army, but left it because his plebeian birth excluded him from promotion. Early in the French Revolution he joined the faction of volunteers, and rose rapidly in rank, becoming in December 1793 a general of division. He distinguished himself greatly in the campaigns in Upper Italy, especially at Saorgio (1794), Loano (1795), and Rivoli (1797), and earned from his chief his famous surname of enfant chérir (cherished child). After the battle of Stockach (25th March 1799) the chief command of the army in Switzerland devolved upon him in circumstances of great difficulty, but he kept his ground against the Archduke Charles, and finally by his crushing victory over Suvoroff's Russians at Zurich (25th September 1799) freed France from the danger of invasion. In 1804 Napoleon made him a marshal of the empire, and next gave him the command of the army of Italy. He kept the Archduke Charles in check, crushed him at Caldiero, and overran Naples. In 1807, after the battle of Eylau, he commanded the right wing of the French army, and at the end of the campaign was created Duke of Rivoli. During the peace he lost his left eye by accident at a hunting party. In the campaign of 1809 against Austria he commanded on the left bank, landed, and covered himself with glory at Landskoh, Eckmühl, and Elbersberg-on-Trann. On the second day of the battle at Aspern or Espling (22d May), with the most conspicuous bravery he covered the army in its crossing the Danube, and along the line of its destruction, earning for himself the title of Prince of Espling. In 1810 he was sent to Spain to drive the English into the sea, and he compelled Wellington to fall back upon his impregnable lines at Torre Vedras. Finding it impossible to obtain any advantage, and harassed by lack of supplies, he
Masseuet, Jules, French musical composer, was born at Montauban, near St Etienne, on 12th May 1842, and after a most successful career as a student at the Paris conservatory, chiefly under Amat, he was appointed professor of composition at that institution in 1878. He won the Prix de Rome in 1863, was favourably received as the composer of meritorious orchestral works and a comic opera, La Grande Tante (1867), before the Franco-Prussian war, and in 1873 took his place amongst the foremost of the younger composers of France, his fame being established by the comic opera Don César de Bazan (1872), the classical opera Les Erinyes (1873), and the oratorio Marie Madeleine (1873). These were followed by the oratorios Éve (1875) and Véronique (1879), the great opera Raphaël (1887), his last, Munon Lessoult (1884), and Esaïe-Mendone (1889), besides numerous pianoforte and orchestral pieces.

Massillon, Jean Baptiste, one of the most distinguished of modern orators, was born at Hyères in Provence, 24th June 1663. His father was a notary and had designed him for his own profession; but at length in 1681 the boy obtained permission from his parents to enter the congregation of the Oratory. Later he subjected himself to a more rigorous discipline in the abbey of Sept-Fontes. His preaching power was soon discovered, and his funeral oration on M. Villars, the Archbishop of Vienne, established his fame, and led him to assume the direction of the Curé de Saint-Vincent de Paul's delimitation to Paris, where he first had the opportunity of hearing Bourdaloue, whose style and manner powerfully influenced the young orator. It is said that the older preachers said when first he heard him, 'He must increase, but I must decrease.' Like Bourdaloue, he avoided the declamatory manner and theatrical action then popular in the French pulpit; and the earnest impressiveness of his face and voice more than counterbalanced the lack of such adventitious aids to effect. He gave a remarkable series of lectures in the seminary of St Magloire, and first preached before Louis XIV. in Advent 1689. It was to him that the king said, 'I have heard great orators in my chapel and have felt satisfied with them, but every time I have heard you I have felt dissatisfied with myself'—a saying which does justice to the fearless eloquence of this great orator, who, more than any of his contemporaries, was able to lay bare the secret springs of human action, and to use the feelings and the passions of his audience as arms against themselves. He was again appointed the preacher of the Lent at Versailles in 1704; but although the king was again equally warm in his admiration, Massillon was never afterwards invited to preach in his presence. In 1717 Massillon was named Bishop of Clermont, and next year preached before the young king, Louis XV., he celebrated Petit Carême—a series of seven sermons held in Lent, during which it was found that he was consecrated Bishop of Clermont, in which year also he was elected a member of the Academy; and in 1725 he preached the funeral oration of the Duke of Orleans, his last public discourse in Paris. From this time he lived almost entirely for literature; and many changes of residence and gentleness gained him the love of all. He died of apoplexy, 28th September 1742. Bossuet and Bourdaloue contest with Massillon the palm of oratory, yet it is not too much to say that he was a greater preacher than either. By French critics he has been termed the Racine of the pulpit, and the name may pass as regards the purity and elegance of Massillon's language, though it takes no count of his characteristic directness and vigour. For impassioned denunciation of vice marks his preaching, no less than gentle persuasiveness to virtue, although it remains true that he is greatest in the latter. His sermons on the Prodigal Son, on the Deaths of the Just and the Unjust, for Christmas, and for the Fourth Sunday in Advent may be named amongst his masterpieces. His sermons were collected by his nephew (15 vols. 1810—45); the oratorios are edited by the Abbé Guillon (16 vols. 1828), and Blanpinon (4 vols. 1886). See Sainte-Beuve's Causuaires du Lundi, vol. ix.

Massinger, Philip, dramatist, baptised at St Thomas's, Salisbury, 24th November 1583, was a pupil of Arthur Hyper, a clerk of the Exchequer, and Pembroke. In a dedicatory epistle to Philip Herbert, Earl of Montgomery, prefixed to The Bondman (1624), he mentions that his father spent many years in the service of the Herbert family, and died a servant to it. On 14th May 1602 Massinger entered St Allian's Hall, Oxford, and he left the university without a degree in 1606. Gifford supposed that during his residence at Oxford he became a convert to the Roman Catholic faith; and the plays afford some evidence in support of this view. Massinger was writing for the theatre during the lifetime of the stage-manager Philip Henslowe, who died in January 1615—16. At Dulwich College is preserved an undated letter (circa 1613—14) to Henslowe from Nathaniel Field, Dalborn, and Massinger. The three playwrights were financially connected, and each of five sums ("without which we cannot be bailed") on a play which they were preparing. Their petition was granted. On 4th July 1615 Dalborn and Massinger borrowed from Henslowe the sum of three pounds. In later years Massinger wrote many plays single-handed; but much of his work is mixed up with the work of other men, particularly Fletcher. His friend Sir Aston Coke, in an Epitaph on Mr John Fletcher and Mr Philip Massinger, expressly states, "Playes they did write together, were great friends." Beaumont and Fletcher shared the profits, and the plays ascribed to 'Beaumont and Fletcher;' but Massinger and Fletcher continued to work together long after Beaumont's death. Fletcher was buried in St Saviour's Church, Southwark, 29th August 1625; and Massinger was laid in the same grave, 16th December 1627. Probably the earliest of Massinger's extant plays is The Unnatural Combat, a repulsive tragedy, printed in 1639. The first in order of publication is The Virgin Martyr (1632), partly written by Dekker, who doubtless contributed the beautiful passage about the young couple before the Duke of Norfolk. On 16th December 1623 was published The Duke of Milan, a fine tragedy, but too rhetorical. The Bondman, The
Renegado, and The Parliament of Love were licensed for the stage between 3d December 1622 and 3d November 1624. In many of his plays Massinger introduces political allusions, and more than once his temerity was rebuked by the Lord Mayor. His plays include Massinger the Revels. The Bondman contains some outspoken criticism on the feeble condition of the navy. There is considerable resemblance between The Parliament of Love, which was first printed by Gardiner and Newbery, and The Rivals, a Care for a Cowbold, ascribed to Webster and Rowley. If the work is impossibly the work of Massinger and Rowley. Of The Roman Actor, produced in 1626 and printed in 1629, Massinger declares 'I ever held it the most perfect birth of my Minerva.' It abounds in eloquent declamation, but is nowhere stiff. The Great Duke of Florence, produced on 5th July 1627, has a delightful love-story. Massinger's female characters are usually unattractive and sometimes odious; but in this comedy he has drawn a charming heroine—a modest, frank, warm-hearted girl, The Maid of Honour, published in 1632 and probably produced in 1628, is—like The Bondman—full of political allusions (as Professor S. R. Gardiner has shown, Contemporary Review, August, 1876). The Picture, licensed for the stage 5th June 1629, and printed in 1630, has an improbable plot, but features the first performance of the famous play, The Devil's Disciple, printed in 1632, bears some resemblance to The Duke of Milan. In both plays a man of passionate, uncontrollable temper unjustly suspects his wife of infidelity; but The Emperor is an excellent and happy play. Nathaniel Field joined Massinger in writing the first tragedy, The Fatal Dowry, printed in 1632, but produced some years earlier. From this play Rowe's once-famous Fair Penitent was largely drawn, without acknowledgment. The City Madam, licensed for the stage 24th November 1633, and printed in 1634, is a satirical play on the vices of the age. The New Way has held the stage down to recent times. The Man of Mode, A New Way of Debts, printed in 1633, are Massinger's most masterly comedies. There is no warmth or geniality about them; but, as satirical studies, they have been praised. The Massinger's strength without his ponderousness. A New Way has held the stage down to recent times. The Man of Mode, A New Way of Debts, printed in 1633, are Massinger's most masterly comedies. Massinger's plays were edited by William Gifford in 1808, 4 vols.; 2d ed. 1810. There is also an edition in the volume (from the text of Gifford) by the late Lieutenant-colonel Cuningham. Two volumes of selected plays, edited by Mr Arthur Symons, are included in the 'Merriaid series. See S. R. Gardiner, 'The Political Element in Massinger' in Cont. Rec. 1876.

Masson, David, an eminent Scottish author, born at Aberdeen, 2d December 1822, educated at Marischal College in that city, and at the university of Edinburgh. He was selected as a Scotch professor of Greek, and was afterwards engaged in the literary staff of W. & R. Chambers. In 1847 he settled in London, writing for the reviews, the Encyclopedia Britannica, and the English Encyclopaedia. In 1852 he succeeded Clough in the chair of English Literature at the University College; and in 1853 he became professor of English Literature in the University of Edinburgh, a post he resigned in 1855. Masson edited Macmillan's Magazine from 1853 to 1868. His first published work was his Essays, Biographical and Critical (1836), reprinted with later essays in 3 vols. (1874-76) entitled respectively Wordsworth, Shelley, and Keats; The Three Devils—Luther's, Milton's, and Goethe's; and Chatterton, a Story of the Year 1770. His great work is his Ponderous Life of John Milton, narrated in connection with the Political, Ecclesiastical, and Literary History, the Life and Writings of Shelley, the Life and Writings of Coleridge (2 vols. 1859-80), the most complete biography of any Englishman, and of great value for the contemporary history. Other works are British Novelists and their Styles (1859); Recent British Philosophy (1865); De Quincey, his Life and Writings (1873); the 'Cambridge' edition of Milton, with introductions, notes, and an essay on Milton's English (3 vols. 1874; new ed. 1890), the 'Golden Treasury' edition (2 vols. 1874), and the 'Globe' edition (1877). Later works are De Quincey's (1878) in The Men of Letters series, and his edition of De Quincey's works (14 vols. 1859-91), besides some volumes of Sketches and Essays (1892 and 1894). He was Rhind lecturer in 1883, after 1879 he edited the Register of the Privy-council of Scotland, and in 1893 received the honorary degree of LL.D. from the University of Edinburgh.

Massorah, or Masorah ('tradition'), a collection of critical notes on the text of the Old Testament, its divisions, accents, vowels, grammatical forms, and letters (see HEBREW Language, Vol. V. p. 614). The Massorah, like the Halakah, or Rabbinic law, was handed down through ages and centuries, as indeed, we find in ancient authorities mention made of different systems of accentuation used in Tiberias, Babylon (Assyria), and Palestine. It was in Tiberias also that the Massorah was first compiled to writing between the 6th and 9th century A.D. Monographs, memorial verses, and glosses on the margins of the text seem to have been the earliest forms of the written Massorah, which gradually expanded into one of the most elaborate and minute systems, laid down in the
If any person entice away a servant, and thereby cause loss to the master, the latter may sue such person for the injury. If the servant is sundered, and thereby is unable to continue her service, the master may also bring an action against the sederer for any loss of service caused thereby; and on the same principle a master may bring an action against a third party who causes personal injury to the servant. In the case of the bankruptcy of the master a preference is given to the servant's wages if due and unpaid; but this extends only to two months' wages, and the servant is an ordinary creditor for the balance beyond that sum. The death of the master is a discharge of the contract. The master is not bound to provide medical attendance whether the servant lives under his roof or not; but, as in such cases a doctor is often sent for by the master without any understanding between the parties, the master is frequently made liable on the ground that the doctor was sent for, and gave credit to the master. As a general rule, the master takes the risk of all the ordinary accidents attending the particular service; but under the Employers' Liability Act of 1880 a workman, or, if the injury results in death, his legal personal representatives, shall have a common right of action for any injuries suffered by him, and the master is required to render accounts to the workman. The master is not liable for breaches of the sea or land laws committed by the servant in discharge of the contract, unless the contract stipulates that he is bound to do so. The master is also not liable for the injury caused by the servant to passengers, whether carrying or not. The master is not liable for the loss of property or money, except by false, or malicious, or fraudulent means, or in the case of breach of trust. If the master has been driven into bankruptcy, the servant is entitled to the same sterling value; they are not only sometimes utterly superfluous, but downright erroneous. See Dr Ginsberg's great work on the Massoraih (4 vols. folio, 1880-86).

Massowah, or Massaia, a town built on a coral island off the west coast of the Red Sea, in 15° 36' N. lat., 30° 28' E. long. It was seized by Turkey in 1557, but in 1806 given by her to Egypt; and in 1885 it was occupied by Italy. The island is only about 1½ mile in circumference, and is connected with the mainland by a causeway, 1610 yards in length, resting on an intervening island. The population is 10,530, of whom 15,000 are natives, 500 Italians, 700 Greeks, and 100 Banyan. Fishing for pearls and mother-of-pearl is the principal industry, but there is also a little fishing and reeling-up of palm-likes. Next after Sukki, Massowah is the most important harbour for small shipping in the African coast of the Red Sea. Its imports (cottons, chemical products, animals, grain and flour, groceries, spirits, hives, and timber) are valued at £412,000 annually, and its exports (pearls and mother-of-pearl) at £22,000. Skins, gowns, ivory, wax, and gold are also exported, but their annual value cannot be stated. Massowah is very hot (mean of the year, 85½° F.) and very unhealthy; nevertheless the advantages of its site have led the Italians to make it their headquarters in this part of Africa. Pop. of the district of Massowah, 18,653.

Master, in the royal navy, was an officer ranking with, but junior to, lieutenants, and charged with the details of sailing the vessel, under the general orders of the captain. In recent years the title has been changed to 'navigating lieutenant.' In the merchant navy the master of a vessel, usually, denominated the captain, is the officer commanding.

Master and Servant. The relation of master and servant is constituted in Great Britain entirely by contract; for, there being no status of slavery recognised in law, one person can only serve another with his or her own free consent. Being a mere contract, it may, like other contracts, be broken at will, subject only to the usual consequence, that the party in the wrong is liable to pay damages for the breach. The engagement or hiring of a servant may be either verbal or in writing; but if the engagement is for more than one year it must be in writing. A servant undertakes to have competent skill or diligence, and is bound to use due diligence, and to conduct himself respectively. He is bound to obey all lawful orders of his master during the engagement, if they are within the scope of the particular service for which he is engaged. Thus, a coachman is not bound to do the duties of a cook, and vice versa. A servant is bound to take due care of his master's property, and is liable to an action at the suit of his master for gross negligence, and also for fraud and misrepresentation. A master is not entitled to recover damages from a servant and the servant may be, though, in the case of an apprentice under age, a moderate chastisement is justifiable. The grounds on which a servant may be lawfully discharged are wilful disobedience, gross immorality, habitual negligence, and incompetence.
punishing by imprisonment the servant who left the service without just cause. This law, complained of by workmen as one-sided, was modified by statutes, the regulations of which are now embodied in the Employers and Workmen Act, 1875, and the Conspiracy and Protection of Property Act, 1875. These acts give the county courts special powers with regard to the settlement of disputes between employers and workmen, and provide that the conviction of a person of 21 years of age cannot be indicted for conspiracy to do what would not be criminal if done by one only. Workmen employed by gas and water companies are liable on breach of their contract to fine or imprisonment.

The law of the United States does not recognize a distinction between domestic and other servants.

In Scotland the law as to master and servant differs from the above in several particulars, of which the following are the most important. With regard to domestic servants, in towns, if nothing is said, then the hire is for half a year, and cannot be put an end to without forty days' warning before the end of the half year; and if the servant is dismissed without just cause, he or she can claim not only wages but board-wages till the end of the term. In many cases in Scotland to-day the servant can claim wages for the whole of the current term, but is bound in that case to serve the ex-converts, or look out for another situation. In case of the master's bankruptcy the servant is a privileged debtor for the wages of the current term. In most other respects laws as to servants is the same as in England. See C. M. Smith's Law of Master and Servant (4th ed. 1885).

Master of Arts (abbreviated M.A., and sometimes, particularly in America, A.M.) is a degree conferred by universities and some colleges. In the universities of England this title follows that of Bachelor (q.v.). The dignity of Master (Magister artium liberationis) was held in high esteem in the middle ages. In Germany it is now obsolete, having been superseded by that of doctor. A Master has the right to vote in congregation or convocation at Oxford, and in the senate at Cambridge, and consequently enjoys the university franchise.

In the Scottish universities all Masters are members of the General Council, and as such elect the parliamentary representatives for the university. See Degrees (University).

Master of Ceremonies, of the Rolls, &c. See Ceremonies, Rolls, &c.

Masterwork (Peucetium Ostreatum), a perennial herb of the natural order Umbellifera. It is a native of the north of Europe and the north of America, and is found in moist pastures in some parts of Britain, but apparently naturalised rather than indigenous, its root having formerly been much cultivated as a potherb, and held in great repute as a stomachic, sudorific, diuretic, &c. The root has a pungent taste, causes a flow of saliva and a sensation of warmth in the mouth, and often affords relief in toothache. Astrantia major, a herb belonging to the same natural order and having similar properties, is also named Masterwort.

Mastic, a species of gum-resin yielded by the Mastix tree (Pistacia lentiscus, natural order Terebinthaceae). It oozes from rents made in the bark, and hardens on the stem in small round tear-like lumps of a light straw colour, or, if not collected in time, it falls on the ground; in the latter case it acquires some value, but is consequently less valuable. The chief use of this gum-resin is in making the almost colourless varnish for varnishing prints, maps, drawings, &c. It is also used by dentists for stopping hollow teeth, and was formerly employed in medicine. It is imported in small quantities, chiefly from the Moroccan coast, but some is brought from the south of Europe and the Egean. The name of mastic is also given to oleaginous cements, composed of about 7 parts of litharge and 93 of burned clay, reduced to fine powder, made into a paste with linseed-oil.

Mastiff. The characteristics of the mastiff group of dogs are very marked and constant. One variety of the breed has been known from ancient times as the English, another as the Bordeaux or mastiff of Gau. These may be classed as the European, while another kind is the Asiatic, of which the Tibetan is perhaps the most typical. No group of domestic dogs has more appearance of being an original and distinct species, although the English mastiff has been crossed and regressed from time to time, principally with the object of increasing the size; and, while the blood of the Asiatic variety was very probably introduced at an early date, subsequently crosses with the Alpine mastiff, the St Bernard, the boarhound, and the bulldog have undoubtedly been introduced, and the modern English mastiff must be regarded as a composite breed.

The English mastiff is thick-set and powerful, with a large head and broad, short, truncated muzzle, large, thick, pendulous lips, ears formerly often semi-erect, now hanging and of medium size, smooth-haired, with frequently a full but not bushy tail. This variety formerly averaged from 25 to 28 inches at shoulder, but during the last half of the 19th century, owing to repeated crossing and selection, an average of from 30 to 32 inches at shoulder has been obtained, perhaps somewhat to the loss of muscular power and activity. The colours are all shades of fawn, tan, and black, with and without mixture of white. Formerly red and brindle were the commonest colours, but owing to selection fawn in all shades is now the most prevalent, with the muzzle, ears, and other extremities shaded with black or darker markings.

The mastiff was formerly very courageous, and would readily attack the lion or bear; now it is chiefly valued for exhibition purposes, and £70 is not an outside price for a really typical specimen. As a companion or watch-dog no other variety equals it, for, while faithfully protecting the property entrusted to it (at times with marvellous sagacity and discrimination), it has the additional merit of generally refraining from the infliction of personal injury on the invader, unless aggravatingly provoked. It becomes independent and instinctively attached to its master, although not demonstratively affectionate. It has an excellent nose, but is of little or no use for sporting purposes, and dull at learning any kind of tricks.

The mastiff of Tibet was larger than the old English, but is smaller than the modern English
MASTODON

Makalaka, the 1840 span, and 1886) the Matabele seized the opportunity of reasserting their independence; the native armed police mutinied, and Buluwayo, the capital, was blockaded. The British South African Company, its officers, and settlers strained every nerve to maintain their position and repulse the invaders and after much sharp fighting and with the help of British troops had practically pacified the country by the latter part of the year.

See Rains, Gold Regions of South-East Africa (1877); Montagu Kerr, The Far Interior (1886); Oates, Matabeleland (2d ed. 1889); Selous, A Hunter's Wanderings in Africa (1881), and Travel and Adventure in South-East Africa (1893); Mathews, Zambezia (1891); Colquhoun, Matabeleland (1884).

Matador (Spa., 'slayer') See BULL-FIGHT.

Matamoros, a river-port of Mexico, lies opposite Brownsville, Texas, on the south bank of the Rio Grande, 40 miles from its mouth in the Gulf of Mexico. With the other Mexican towns on the river it has formed a free-trade league since 1861. The Rio Grande is navigable for small vessels as far as Reynosa on the Mexican side, but no navigation beyond this point to San Miguel (75 miles). Pop. 13,740. Another Matamoros is in the Mexican state Puebla, 4160 feet above sea-level. It has coal-mines and a pop. of 13,408.

Matanzas, a fortified town and seaport on the north coast of Cuba, 55 miles by rail E. of Havana, to which city alone it is second in size and wealth. It is well built, situated in an exceedingly fertile district, and has an excellent harbour, sheltered from all but the north-east winds, and a large trade in sugar, molasses, coffee, tobacco, &c. Pop. (1899) 36,374; of the province, 202,444.

Matapan, Cape, the southermost point, bold and precipitous, of the Morea in Greece, 36° 22' N. lat.

Mataro, a seaport of Spain, 17 miles by rail N.E. of Barcelona, has cotton, sandlecloth, gauze, and machinery factories, iron-foundries, and shipbuilding yards, besides a marine school. Pop. 17,405.

MATCHES

The name now given to splints of wood tipped with some composition (often containing phosphorus) to produce a light by friction. These cases often resulted in the destruction of large towns and villages, the common light producer was the flint and steel along with a tinder-box. The tinder (charred cotton) was set on fire by sparks from the flint and steel, but did not burst into flame. This was obtained by touching the burning tinder with a span or strip of wood tipped with sulphur. Perhaps the most primitive way of producing a light is by rubbing two pieces of wood together, or by rapidly twirling one piece of wood into a hale or socket in another piece, touchwood being ignited by either process as soon as dry. These methods of obtaining fire by the friction of two bits of wood are in use by some savage races (see FIRE). Among other devices formerly employed for the same purpose were a lens to concentrate the sun's rays on some inflammable substance; an arrangement (Philippi's light) of the South African Company, who, as the Matabele still continued their periodic raids and forays, renewed in July and August 1893, organised an expedition in three columns, supported by some regular Boer troops, under Kaffirs and his Basuto, against King Lobangula, the son of Mzilikazi. The expedition, which began to advance on October 20, was brilliantly successful in repeatedly defeating the savage warriors, who could not stand before the Maxim gun and, after some sharp light-
MÁTÉ

MATE

sparks of kindled matter it was not free of danger. The introduction of phosphorus in 1834 was a great improvement.

The chief operations in the manufacture of matches embrace (1) cutting the wood splints; (2) immersing the splints in melted paraffin; and (3) preparing the igniting composition and dipping the cut end into it. This is used in the making of the boxes, which, in the case of safety matches, have the phosphorus composition glued upon their sides. Pine or aspen is the wood used for the splints.

There are several kinds of splint-cutting machines. One of the simplest is a special kind of lathe for which the tree trunks to be operated upon are sawn across in pieces 14 inches long, and the bark removed. One of these pieces is the length of seven matches, and is fixed on the chuck of the lathe and cut into a continuous slice or shaving equal to a match in thickness. The principal cutting tool is fixed on the slide-rest, and as the shaving comes away it is divided into seven equal widths by cutters placed above the chief slicing tool. After the two-inch wide shavings are cut into six feet lengths, they are put into the machine, which has a guillotine cutter similar to that used for cutting paper. Under favourable circumstances this machine will cut a million splints in an hour.

For the purpose of being immersed in paraffin and afterwards dipped into the igniting composition the splints are dipped into a dipping-train. This frame consists of thin wooden laths fully two feet long, placed parallel to each other and held in position by two round iron bars passing through holes in their ends. About fifty splints, projecting equably beyond the bars, are held firmly between every two of these laths at a little distance from each other, the whole frame containing between two and three thousand. The splints are supplied to the frames by filling-machines, of which there are several kinds, chiefly of American invention. In the dipping room, to which these filled frames are taken, the igniting composition is spread of the proper thickness on a hollow iron table kept hot by steam, and the splints dipped into it to form them into matches. The rooms where the igniting-mixture is prepared and the matches dipped are, or at least were, the hot shop of a wealthy match manufacturer, and are much like a factory. In former days especially, among those who worked in these rooms cases of necrosis or caries of the lower jaw occurred from the action of the phosphorus fumes. But, owing to the lessen'd quantity of phosphorus now used, the dipping-mixtures and improved ventilation, this disease has become rare. It never occurs at all where red or amorphous phosphorus is employed, but common phosphorus is still very largely used.

Nearly every manufacturer has his own special mixture for the dipping of matches. One published recipe gives as the ingredients for this: 1 part by weight of common phosphorus, 4 of chloride of potash, 2 of glue, 1 of whiting, and 4 of finely-powdered glass. The proportion of phosphorus is small in this mixture. As it makes a more noiseless match, nitrate of potash is sometimes substituted for the chloride. Other oxidising agents used instead of, or along with, these salts of potash are oxide of manganese and the red oxide or the dioxide of lead. Of course some water (slightly heated) is used in preparing dipping-mixtures. According to Gantier (Œuvres de Chanté, 1857), the igniting-mixture for ordinary matches made in France consists of 3 parts of common phosphorus, 2 of lead dioxide, 2 of sand, and 3 of gum. The same author states that safety or 'Swedish' matches are dipped in a composition of 5 parts of chloride of potash, 2 of sulphide of antimony, and 1 of glue; and that the rubbing-surface for these is a mixture of 5 parts of amorphous phosphorus, 4 of sulphide of antimony, and 2 of chloride of potash. It need hardly be mentioned that matches are made in enormous numbers, some large firms turning out a hundred millions daily.

Probably matches to the value of £1,500,000 are made annually in Britain. In Sweden and Norway, where the industry has been rapidly developed, there are some sixty factories; Jönköping alone employs some 6000 matchmakers. Germany and Austria have together as many as 450 factories. In the United States the manufacture is mainly controlled by one combination of capitalists; in France the making of matches is a government monopoly. As a contrast to present prices it may be added that in 1830 the first friction matches, the Congreves, were sold in tin boxes of fifty at half-a-crown a box, each box containing a piece of glass paper to strike the matches on.

Vestas only differ from ordinary matches in the stalks being formed of bits of stearin tapers (called wax-tapers) instead of wood splints. Vesuvianus used by smokers consist of a hard wood, or sometimes a hollow glass stalk, with a bulbous head formed of some slow-burning compound, such as a mixture of charcoal, salt petre, sand, and gum, tipped with the igniting composition of ordinary matches. 'Flamers,' also for the use of smokers, have a thick head of a flaring mixture, with either a 'wax-taper' or wood stalk.

**Matchlock.** See Fire-arms.

**Mate** is an assistant, a deputy, or a second in any work. In the navy the use of the term is now confined to petty officers, such as boatswain's-mate, gunner's mate, &c. In the merchant-service the mates are important officers, holding functions not generally inferior to those of lieutenants in the royal navy. The first mate ranks next to the master or captain, commands in his absence, and is immediately responsible for the state of the vessel; the second and third (and fourth in large vessels) have various analogous duties.

**Maté, or Paraguay Tea,** a substitute for tea, extensively used in South America, and almost universally through Brazil. It consists of the leaves and green shoots of certain species of Holly

Maté (Ilex Paraguayanus).
MATERIA

Vesalius, the great anatomist of the 16th century, is often considered the father of modern medicine. His work laid the foundation for the study of anatomy, which has since evolved into a complex and highly specialized field.

MATERIALISM

Materialism is a philosophical doctrine that holds that material entities are the only reality and that everything else, including mental entities, can be reduced to material causes. It is one of the major competing worldviews in the field of philosophy, alongside idealism and skepticism.

Materialism is often associated with scientific materialism, which holds that everything in the universe is composed of matter and energy, and that all phenomena can be explained in terms of the laws of physics and chemistry.

Materialism has been influential in shaping the development of science and technology, and has been closely associated with the scientific revolution of the 17th century.

Materialism has also been critiqued and challenged by many philosophers and scientists, who have argued that it fails to account for certain aspects of human experience, such as consciousness and free will.

Materialism is a complex and multifaceted doctrine, and its implications continue to be debated and explored by philosophers and scientists to this day.
MATERIA MEDICA

methods of physical science. But physical science, like (say) economic or theological or mental science, takes a page out of the same book of experience. All sciences 'abstract' from the concrete whole of experience contain facts which they propose to investigate in detail. Physicists, like metaphysicians and theologians, are apt to become dogmatical (opuscula of inquiry which they know professedly nothing.

BIBLIOGRAPHY.—Text-books of Materialism which have not already been mentioned are: Gassendi, De Vita, Morbus, et Doctrinam Epicuri (Leyden, 1647); Lamettrie, C’Homme Machine (1748); Haeckel, Natürliche Schöpfungsgeschichte (1868; Eng. trans. 2d ed. 1875-76); Wiener, Grundzüge der Weltenordnung (1863-80); and Huxley’s Address at Belfast, 1875. For an examination of the question of Materialism see Lamettrie, by J. B. Stalla, containing a sifting examination of the atomic theory; Renton of Law, by the Duke of Argyll; and St George Mivart’s books. The best history of Materialism is Lang’s Geschichte des Materialismus (Eng. trans. 1879-81).

Materiâ Medica is that department of the science of medicine which, from its etymology, partly to therapeutics, which treats of the materials employed for the alleviation and cure of disease, their properties, physiological actions, and uses. See Pharmacopoeia, Poison, Medicine, Aperients, and articles on the various drugs.

Mathematics (Gr. mathēsma, ‘learning’), the science which has for its subject-matter the properties of magnitude and number, is usually divided into pure or abstract, and applied or practical mathematics; the first including all abstractions from the abstract, self-evident relations of magnitude and number, the second the results arrived at by applying the principles so established to certain relations found by observation to exist among the phenomena of nature. The branches of pure mathematics which were first developed were, naturally, Arithmetic, or the science of number, and Geometry, or the science of quantity (in extension). The latter of these was the only branch of mathematics cultivated by the Greeks, their cumbrous notation opposing a barrier to any effective progress in the former science. Algebra or the science of numbers in its most general form is of much later growth, and was at first merely a kind of universal arithmetical geometry symbolizing the place of magnitude numbers, but its extraordinary development within the last two centuries has established for it a right to be considered as a distinct science, the science of operations. Combinations of these three have given rise to trigonometry and analytical geometry. All these sciences in which a few simple axioms are mathematically shown to be sufficient for the deduction of the most important natural phenomena are regarded as belonging to applied mathematics. This definition includes those sciences which treat of pressure, motion, light, heat, sound, electricity, and magnetism on the ‘abstract’ view of physical phenomena—and excludes chemistry, geology, political economy, and the other branches of science, which, however, receive more or less aid from mathematics. See Geometry, and the works there cited; also, better articles under the names above, and many others, the following:

Mather, Increase, a famous American colonial divine, was the sixth son of Richard Mather, an English Nonconformist minister, who emigrated to Massachusetts in 1635. He was born at Dorchester, Massachusetts, June 21, 1639, graduated at Harvard College in 1656, and again at Trinity College, Dublin, in 1658. His first charge, at Great Torrington in Devonshire, was given him on the advice of John Howe. He next preached in Guernsey, but in 1661, finding it impossible to conform, returned to America, and in 1664 was ordained and appointed minister of the North Church, Boston. He remained till his death, August 29, 1728. In 1681 he was also chosen president of Harvard College. An industrious student, he published no less than 136 separate works, most of which are now very scarce. Of these the most interesting, Remarkable Providences (1684), was written during the civil wars of 1642-48, and The History of the War with the Indians (1676) was reprinted in Boston in 1889. Mather’s influence was great in the colony, and in 1688 he was sent to England to lay its grievances before the king. He was successful in obtaining a new charter from William III. His Return to Witchcraft and Possessions (1683) did much to cool the heated imaginations of the New England colonists, and saved lives by refuting the doctrine of 'spectral evidence.'

His son John Mather was born in Boston, February 12, 1663, and graduated in 1678 at Harvard, where his precocious learning and pietistic excited great expectations. He entered upon a course of fasting and vigils, eured a habit of stammering by speaking with 'dilated deliberation,' and finally took orders and became a colleague of his father in the ministry of the North Church at Boston. His industry was phenomenal and his learning remarkable, while his vanity and fluency enabled him to pour from the press as many as 382 books. He took a fatal interest in witchcraft, and his Remarkable Providences was written to re-instate Witchcraft and Possessions (1683) did much to fan the execrable fury of the New Englanders. The first phenomena of the notorious Salem witchcraft mania occurred in 1692, and Mather plunged into the discussion, to which he committed the world through his Wonders of the Invisible World (1692). While it is true that his contemporaries fully shared his belief in witchcraft, none pursued the inquiry with such hateful zeal, and on the head of none rests a heavier burden of bloodguiltiness. Even himself lived afterwards once the world and his own too far in that affair,' Mather died February 13, 1728.

The chief of his works is Magnalia Christi Americana (1702), an undigested mass of materials for the church history of New England. His Brief Essay to do Good (1710) was much esteemed by Franklin. His life was written by his son, Samuel Mather (1729). See also Charles W. Upham, History of the Salem Delusion, 1853 (1851); and the Rev. Enos Pond, The Mather Family (1849).

Mather, Theobald, commonly known as Father Mather, an eminent Irish apostle of temperance, was born at Thomastown in Tipperary, October 10, 1790. He studied for the Roman Catholic priesthood at Kilkenny and for a short time at Maynooth, but relinquished the secular priesthood for the religious charge of the Chaplain's, in which he took priest's orders in 1814, and was sent to the church of his order in the city of Cork. He devoted himself to the ceaseless labours of his calling with untiring zeal, and, finding that the poverty and degradation of his people were a great evil due to over-drinking, was driven by his enthusiastic temper to advocate the
drastic remedy of total abstinence. In 1838 he began his crusade, which quickly grew beyond the bounds of Cork, and extended to Dublin, to the North, to Liverpool, Manchester, London, Glasgow, and the other chief cities of the Irish popula-
tion, even in the New World itself. His success had something of the marvellous in its character. The form of engagement partook of the religious, and was accompanied by the presentation of a medal, to which the utterance of the Irish people was attached by the recipient; and an opinion prevailed among the poor that the mission of the ‘Apostle of Temperance’ was marked by many miraculous manifestations of the assistance of Heaven. Father Mathew’s latter years were emblazoned by pecuniary embarrass-
ments, the fruit of his unprudence; but the expenses connected with his mission, and per\-haps his own improvident and unworthy habits. A Civil List pension of £300 was granted him in 1847, and a private subscription was also raised for his relief. The enthusiasm for his cause declined amid the sufferings of the potato-famine, and Father Mathew died, worn out by his labours, December 8, 1856. See Harriet Martineau’s Biographical Sketches, and Lives by J. F. Maguire (1863) and F. J. Matthew (1890).

Mathew, Charles, comedian, was born in London, 25th June 1776, and educated at Mer-
cers’ Hall. His father was a bookseller, and intended his son to follow the same busi-
ness; but his early inclination for the stage overcame parental counsel, and he made his first appearance as an amateur—in the part of Richmond—at the Richmond theatre in 1793, and as a professional comedian in Dublin, Dublin, the follow-
ing year. He then served an apprenticeship in the famous company under Tate Wilkinson, and made his first appearance in London on 15th May 1803, at the Haymarket, then managed by George Colman. Next year he played at Drury Lane, and he afterwards acted at Covent Garden and the Lyceum; but he was not satisfied with the class of part given to him, and in 1818 he took up the profession of ‘entertainer’ and made an immense success with his ‘At Home’ and other enter-
tainments. In the class of business he passed the remainder of his life, appearing frequently in the provinces and visiting America twice. He died at Plymouth on 24th June 1833. Mathews was a true comedian, with extraordinary powers of impersona-
tion, entering into the very mind of the person he impersonated. He was merely a ‘mince’—one who reproduces oddities and peculiarities of a person he represented. See his Memoirs by Mrs Mathews (4 vols. 1838–39).—His son, CHARLES JAMES (born 25th December 1803; died 24th June 1878), was a delightful light comedian, with no depth of feeling, but with charming grace and delicacy. In 1838 he married the daughter of the Rev. Vestris. See his Life, chiefly autobiographical, edited by Charles Diékens (2 vols. 1879).

Mathias Corvinus. See Matthias.

Mathilda, Countess of Tuscany, well known in history through her constant support of Pope Gregory VII. In his long struggle with the Empire, he was a daughter of Boniface, Count of Tuscany, and of Cosimo Buondelmonti, and was born 1046. She married first Godfrey (surnamed the Hunchback), Duke of Lorraine, from whom she lived separate in Italy, and afterwards, when over forty years of age, the boy Guelph of Bavaria. Both were mere alli-
ances of policy. In 1077 she made a gift of all her lands to this purpose at cause of a long contest. It was at her castle of Cappessa that Henry IV. did his humiliating penance to Pope Gregory. Four years later she alone stood by the pope when Henry poured his troops into Italy, she supported him with money when he was besieged in Rome, and after his death at Salerno boldly carried on the war against the emperor. ‘The great Countess’ died in 1113.

Matthira. See Matraria.

Matteo (Artontho elvognus), a shrub of the natural order Rosaceae, remarkable for the stypic property of its leaves, which are used for staunching wounds, and for other medicinal qualities.

Matilda, ‘the Empress Mand’ (1103–67), was the only daughter of Henry I. (q.v.) of England, married in 1114 to the Emperor Henry V., and after his death in 1125, to Count of Anjou, by whom she became mother of Henry, afterwards Henry II. (q.v.) of England. There was civil war between her and Stephen (q.v.) from 1139 till 1147.

Matins. See Breviary.

Matlock, a Derbyshire parish, 17 miles N. by W. of Derby, containing Matlock Bath, Matlock Bridge, Matlock town, and Matlock Bank, which extend for 2 miles along the romantic valley of the Derwent. Matlock Bath is noted for a huge lime-tree and for its hot springs of 68° F., the waters of which are largely charged with carbonic acid, and were first used for curative purposes in 1798. At Matlock Bank are several hydropaths, the earliest of which is from 1805. Matlock Bath and Matlocks have a dozen hotels. Among the lions of this beautiful neighbourhood are the High Tor (400 feet), the Heights of Abraham and the Masson (1110 feet), and a number of large stalactic caverns of ‘petrifying’ wells. There are manufactures of cotton, paper, and silk. The Pop. of Matlock town (1891) 4395 and (1891) 5285; of Mat-
lock Bath (1891) 1698 and (1891) 1846.

Matrarchate. See FAMILY.

Matsumai, a seaport of Japan, situated at the south-west extremity of the island of Yesso (Yezo), at the western entrance to the Strait of Tsugaru. Formerly the principal town of the island, it has in recent times been outstripped by its more suc-
cessful rival Hakodate. Pop. (1894) 34,527.

Matsys, or Massys, Quentin, Flemish painter, born at Louvain about 1466, was originally, according to a legend long current, a blacksmith who turned artist. However the connection he explained, it is certain that he settled in Antwerp in 1511, and is admitted to be a member of the painters’ guild of St Luke, and died in that city in 1530 or 1531. He forms a connecting link between the school of the Van Eycks and the later realistic Dutch school. His pictures are mostly religious, treated with a reverent spirit, but with decided touches of realism, and are remarkable for their glow of colour, their absence of light and shade, and their exquisite finish, especially in minor details. An altarpiece representing the Virgin and Child, painted for the cathedral of Louvain; another for the cathedral of Antwerp, the ‘Burial of Christ’, flanked by the ‘Martyrdom of John the Baptist’ and the ‘Martyrdom of John the Evangelist’; and two other examples of the Virgin and Child are his best religious pictures. Such genre-pieces as ‘The Money-changers,’ ‘The Goldsmith,’ and others exhibit his realistic tendencies. Matsys also excels in landscapes. Of his rare and excellent specimens of his skill in this department are the portraits of Petrus Aegidius and of Maximilian of Austria. He seems to have been acquainted with Lucas van Leyden, Holbein, Dürer, Bernaumes, Erasmus, and Thomas More, and other notable contemporaries.

Matter. It is impossible to give a really satis-
factory definition of this term. We may employ as equivalents such words as Stuff, Substance,
Body, &c., but all are inadequate. The reason is simply that we do not yet know what Matter is, and it is probable that we shall never be able to obtain an exact and complete conception of its true nature. Metaphysicians differ among themselves more perhaps on this subject than on almost any other. Some of them deny altogether the possibility of objective existence. Many, however, tell us that 'Matter is something that can be perceived by all the senses.' Others vary the term slightly, and call matter 'A Permanent possibility of sensation.' Hegel defines it as 'Nature self-externality in its most universal form, with a tendency to self-internalisation or individualisation shown in the natures of gravitation.' Scientists men can, as yet, define matter only by some of its properties. One of their favourite definitions is Matter is what can occupy space. Another is that which possesses inertia. Again, it may be regarded as the vehicle of Energy (q.v.), inasmuch as energy is never found except in association with matter. If a scientific man, though confessing that none of his definitions can be adequate, knows that each of them expresses some part of the truth; and he also knows that the metaphysical definitions cited above (so far at least as they are intelligible) are elsewhere left therefore that we can partly know of the existence of energy, and energy is certainly not matter. Again, the notion of Force (q.v.) is entirely sense-suggested, and force is not matter—has not even objective existence.

But, though the ultimate nature of matter is unknown, we already have a distinct sense of its structure and properties, as well as about what (for the present at least) we must call its various kinds. To a brief sketch of these the present article is devoted. Beside that unique and all-pervading species of matter, known as solids, there is another which certainly satisfies the scientific definitions quoted above, but about which we know little more, we have what is called gross or ordinary matter. This we find in two forms, solid or fluid. These are sharply distinguished from one another by their elastic properties. For, while solids (as it were) possess, in a more or less imperfect degree, elasticity alike of bulk and of form, fluids possess the first in perfection and are absolutely devoid of the second. Fluids again are divided into liquids, vapours, and gases. These distinctions, in the case of gross substances, as well as that between solids and fluids, are found to depend mainly upon temperature. The existence of the gaseous state, with its very special features, has enabled us to obtain great insight into the structure of matter. For experiment has assured us that a gas is not a continuous substance, but an assemblage of an enormous number of perfectly distinct and independent particles, each of which moves freely till it collides with another, and thus some eight thousand million times per second has its motion completely changed.

The number of such separate particles in a single cubic inch of air contains twenty-one figures—i.e. is expressed in hundreds of trillions. Yet they are very far from filling that space. Their total bulk probably amounts to less than the five-hundredth part of the bulk of the air. We know this by the way we infer it among the particles of the oxygen group, or among those of the nitrogen: though, by delicate processes not involving chemistry, we can detect a difference between the properties of an oxygen and of a nitrogen molecule. As we know that chemical action can be brought into the gaseous form, we have a proof that every simple solid or fluid must be built up of particles absolutely equal to one another. We figure to ourselves what we call molecular forces (see article MOLECULE) as the cause of the agglomeration, and ascribe the various states of solid, liquid, vapour, and gas in any one substance to the greater or less relative activity of the molecular forces (attractive and repulsive) and of the thermal motions (dissipative or dispersive). The modern kinetic theory of Gases (q.v.) has thus enabled us to account for at least the more simple of their physical properties, such as the experimental relations among pressure, volume, and temperature, known as the laws of Boyle and Chemistery (q.v.), to which we must refer for the discussion of Atomic Weights, Combining Volumes, Valency, &c.

Beyond the state of equal independent particles, as in a simple gas, we know as yet nothing. Many of the properties of the solid and liquid states are obtained from the properties of the aggregate, others by the help of Spectral Analysis (q.v.). But in answer to the question, Do the particles of different simple substances consist of one and the same ultimate material, or no? Intensely attractive as it is, we have absolutely nothing to say. So it is with the question, Are these particles themselves further divisible, or are they atoms? Atoms (q.v.), whether Lucretian or Vorticist, are not even proved to exist. We must, therefore, in further discussing the subject, content ourselves with a few brief statements as to the Properties of Matter.

One of the most remarkable of these, what has been called Conservation of Matter, is the experimentally ascertained fact that no process at the command of man can destroy even a single particle of matter. Still less can it create a new one. It is on this definite basis that the great science of chemistry has been securely built. The Balance (q.v.), used to determine quantity of matter with the utmost precision, is its chief instrument. And this attribute of unchangeable quantity furnishes the most powerful of the arguments for the objective reality of matter.

Quantity of matter, or mass, as it is technically called, is measured by inertia, which (as expressed in Newton's First Law of Motion) may be looked on as the fundamental property of matter. For it is a property possessed by every body, even a particle, in itself, and independently of the vicinity or even the existence of any other body. It is in virtue of its inertia that a body can possess energy, and it is only in virtue of its inertia that work is required in order to set in motion even the smallest particle of matter. Similarly, until it can transfer its energy to some other body, a moving mass must continue to move.

Next in order of simplicity to inertia, which, as we have seen, is a property of every single particle,
MATTERHORN

Matthew (Gr. Mattheus, Lat. Matthaeus, from Heb. Mattai, a shortened form of Mattathya, Mattathah, or Mattathai, 'gift of Jehovah'), one of the twelve apostles (Matt. x. 3; Mark, iii. 18; Luke, v. 15; Acts, i. 13), and, according to tradition, the author of the first of the four canonical gospels, was a Jewish tax-gatherer (Matt. x. 3) at Capernann when called to the apostolate by Jesus, as related in Matt. ix. 9. The closely parallel passages in Mark (ii. 14) and Luke (v. 27) mention Levi in the same connection, and the general belief is that this is simply another name for the same person. Compare the two names Simon and Peter, Joses and Barnabas, though the identification has been disputed both in ancient and in modern times by many weighty authorities, among whom may be mentioned Origen, Grotius, Michaelis, Neander, Ewald, Renan, and Keim. Except in the four lists of the apostles and in Mark, ix. 9, Matthew is nowhere mentioned by name in the New Testament, and ecclesiastical tradition has little to tell of him. An early authority (Heracleon, reported by Clement of Alexandria) represents him as having direct and pure natural descent from Simon of Cyrene, with considerable variations, to have written a gospel for the Christians in Palestine after the dispersion of the apostles, and, after having preached the word in Parthia and Ethiopia, to have suffered martyrdom in Alexandria. The chief document regarding him is that of Papias (bishop of Hierapolis in the 2d century), preserved by Eusébius, to the effect that 'Matthew wrote in the Hebrew (Western Aramaic) dialect a collection of the sayings of the Lord, and each one interpreted them as best he could. This gathering was not accepted as conclusive testimony to the truth of the universally current belief that Matthew the apostle was the author of our first canonical gospel (it being tacitly or expressly assumed that at some later date an authentic Greek translation had been made by him from the Aramaic original concocted for by Papias). Modern criticism of the gospels (see GOSPEL) has led to the general adoption of another view of the passage, according to which it refers to the 'logia' document, or collection of discourses and sayings of Jesus, written in Aramaic by Matthew, which is now believed to have been one of the most important written sources used by the authors of the existing first and third gospels. In this sense, and also as having been prepared primarily with a view to the needs of Jewish Christians, the first gospel is correctly described as the 'gospel according to Matthew.' But that this gospel cannot be of directly apostolic origin, or the work of an actual companion of Jesus, is shown by the artificiality of its arrangement, the vagueness of its references, and its obvious dependence on previous authorities. As to the date of its composition, critics are still at variance, but it is generally agreed that it was placed before or after the year 70 A.D., some seeing in the book numerous references to Jerusalem and the temple and its institutions as still subsisting, while others interpret such a passage as Matt. xxvii. 7 as certainly showing that the destruction of the city had already taken place. The first gospel is one of the most largely quoted than any other by early Christian writers, and in view of the fact that it successfully aimed at a reconciliation between a Jewish and a cosmopolitan conception of Christ as King, yet by the law, as Jesus, yet above Judaism, it has been charged and branded as 'the most important book over written.' For literature, see GOSPEL.

Matthew of Westminster, long supposed to be the author of the maritrfious Flores Historiarum. Sir F. Madden considered his existence as more than doubtful, the work being merely a
special abridgment of the larger work of Matthew Paris, made under that writer's supervision down to 1249; brought down at St Albans to 1239, at which year Paris's Chroniques end, thereafter continued there down to 1295; next brought down to 1325 at Westminster, by John Bower, alias John of London. Sir T. D. Hardy, however, thinks it based on the original writer who preceded Wendor-over as historian at St Albans, whom he identifies as Walter of St Albans, presentor and librarian in the latter half of the 12th century. Copies of his chronicle would become disseminated, and that at Westminster, by its borrowings from the works of Wendorover and Matthew Paris, might well have been taken for a mere abridgment of these. Luard finds, 12, Mr. Alan, at the hands of Stephen Bower in his edition of the Flores (Rolls series, 1890). A translation by Yonge was published in 1823

Matthew Paris. See Paris (Matthew).

Matthew Corvinus, king of Hungary, the second son of James Hunyadi (q.v.), was born at Klausenburg on 27th March 1443. His father having died, his elder brother was slain and himself in 1445, when he became head of the royal house of Hungary of the House of Arpad. After the death of this king Matthias was elected by the magnates to the vacant throne (1453). But it cost him a six years' hard struggle against Turks, Bohemians, the Emperor Frederick III., and disaffected mag- nates, and before he had been crowned at Stralsund he crossed Hungary and Bohemia. He drove the Turks back across the frontiers of his kingdom, and made himself master of Bosnia (1462), and of Moldavia and Wallachia (1467), before he granted them a truce. This breathing-space Matthias employed in making war upon Podiebrad, King of Bohemia, his own father-in-law, whose crown had been offered to him by the pope. Podiebrad died in 1470, but the war was continued against his successor, Ladis- las of Poland. In the midst of the war the magnates rebelled, because their king disregarded their political rights and influence, and offered his throne to Casimir, brother of Ladislas. But Matthias managed to appease them, and in 1478 he concluded peace with Ladislas, obtaining Moravia, Silesia, and Lusatia. Out of this war grew another war in which Matthias engaged to drive the Turks back across the Hungarian frontiers, and captured Vienna (1485). This he made his capital, and two years later he took possession of a large part of Austria proper. Since 1469 the Turks had renewed their terrible invasions of Hungary; but at length in 1479 they met with just chastisement, at the battle of Varna, in the plains between Matthias and Transylvania. But Matthias, who died at Vienna on 6th April 1490, was more than an ambitious conqueror. He greatly encouraged arts and letters: he founded the university of Budapest, built an observatory, summoned scholars and artists to his court, adorned his capital with the works of ren-owned sculptors, employed a staff of literary men in Italy to copy valuable manuscripts, and so founded a magnificent library. This was scattered when the Turks captured Budapest in 1526. The scenes restored in the restoration of Budapest in 1877. At the same time the finances were brought into a flourishing condition, industry and commerce were promoted by wise legislation, and justice was administered strictly to peasant and noble alike. But his rule was arbitrary and his taxes heavy; he died in poverty in 1887, and he overrode the rights of the magnates.

Matto Grosso (' dense forest'), an inland state of Brazil, bordering on Bolivia: it is second to Amazonas alone, both in size and sparsity of popu-lation. Area, 532,708 sq. m.; pop. (1880) 79,750, nearly all Indians and blacks. Within this vast territory several great rivers rise, including the Madeira and the Paraguary; but in most parts there is a scarcity of water during the dry season. The vegetation is generally scanty, grass, bush, and low trees covering the sandstone plateau; high trees and grass vegetation are confined to the river valleys. The gold and diamonds which formerly constituted the wealth of Matto Grosso have been exhausted, and agriculture (insufficient for the wants of the state), and cattle-raising, with the gathering of medicinal plants by the Indians, are now the principal industries. The capital is Cuiabá (q.v.). The former capital, Matto Grosso, on the Guaporé, decayed with the gold-mining industry, and is now a few-haunted place with only some 1500 inhabitants.

Mattoon, a city of Illinois, 172 miles by rail S. by W. of Chicago. It contains railway-shops, flour-mills, and grain-elevators, and manufactures castings and drain tiles. Pop. (1900) 6622.

Maturin, a section of the Venezuelan state Bermeudez, lying W. of the Orinoco delta, and consisting almost entirely of llanos. Area, 13,100 sq. m.; population 75,000.—Maturin town, on the Guaraini, with entrances of cacao, and a trade with the West Indies. Its port is Colorado, 25 miles below, and a railway has been constructed to this point. Pop. 11,351.

Maturin. Charles Robert, dramatist and roman- cer, was born in 1782, waged warfare with poverty as curate of St Peter's, Dublin, and died there, Oct. 26, 1842, after making his name at least notoriety by a series of extravagant novels that outdid Miss Radcliffe. These were The Fatal Revenge, The Wild Irish Boy, The Miserable Chief; and Icket, Women, Melmomoth, and The Albigenses. His tragedy, Baron, had a success at Drury Lane in 1816; its successors, Manuel and Fredolfo, were promptly damned.

Mauthe, a fortified town in the French department of Nord, 4 miles from the Belgian frontier; pop. 6499.

Mauch Chunk, a mining-town of Penn- sylvania, capital of Carbon county, is situated among picturesque hills on the Lehigh river, 97 miles by rail NW., of Philadelphia. There is a switchback railway, 9 miles long, from the town to Summit Hill—a place famous for its 'burning mines,' which have been on fire since 1838. Pop. (1880) 3752; (1900) 4629.

Mauchline, a town of Ayrshire, 12 miles E.N.E. of Ayr, and 10 S.S.E. of Kilwinning. It has long been noted for its wooden small-boxes and similar nicknacks. There is a monument (1830) to fifty martyred covenanters; and 1 mile N. is Mosegill, burns' farm from 1784 till 1788; whilst in the village itself are 'Pooie Nancy's,' the scene of his Jolly Beggars, and Mauchline kirk, of his Holy Fair. Pop. 1616. See works by W. Jolly (1881) and the Rev. Dr Edgar (1886).

Maud. See Matilda.

Maudsley, Henry, a prominent student of mental pathology, was born near Giggleswick in the West Riding of Yorkshire, February 5, 1835, and was educated at Giggleswick grammar-school and University College, London. He graduated M.D. at the university of London in 1857, was for a time physician to the Manchester Royal Lunatic Asylum, but returned to London in 1862 to be a consulting physician. In 1870, now a F.R.C.S. and Chollonian lecturer; and from 1869 to 1879 he filled the chair of Medical Jurisprudence at University College. His works are The Physio-}
Maurice, PRINCE OF ORANGE and COUNT OF Nassau, one of the most skilful generals of his age, was the son of William the Silent, Prince of Orange, and was born at Dillenburg, 15th November 1537. After his father's assassination in 1584, the provinces of Holland and Zeeland, and afterwards Utrecht and the others, elected him their stadtholder. A great portion of the Netherlands was still in the hands of the Spaniards; but, under the admirable leadership of Maurice, the Dutch, aided by an English, Danish, and Dutch confederacy, wrested the Earl of Leicester and Sir Philip Sidney, rapidly wrested cities and fortresses from their enemies. In 1590 Breda, and in 1591 Zutphen, Deventer, Nimmen, and other places fell into their hands, in 1593 (Court-plyning), and in 1597, when he defeated the Spaniards at Turnhout in Brabant, and in 1600 won a splendid victory at Nieuwpoort. Then for more than three years he baffled all the power of Spain by his defence of Ostend. Finally, in 1609, Spain was compelled to acknowledge the United Provinces as a free republic. But from this time keen dissension grew up between the Orange party, who favoured the Guzmanists, and

Then for more than three years he baffled all the power of Spain by his defence of Ostend. Finally, in 1609, Spain was compelled to acknowledge the United Provinces as a free republic. But from this time keen dissension grew up between the Orange party, who favoured the Guzmanists, and} \]
the Remonstrants or Arminians, who found their chief supporters in aristocratic republicans like Olden Barneveldt (q.v.; see also ARMINIUS). That year John Murray (1755-1834), the son of the Unitarian minister, and Maurice at once (1821) renewed the war with Spain. He died, unmarried, at The Hague, 23d April 1825. See Groen van Prinsterer, Maurice et Barneveldt (Utrecht, 1875).

Maurice, John Frederick Denison, one of the most influential thinkers and social reformers of his age, was born at Normanton, near Lowestoft, 29th August 1805. In 1814 the family removed to Frenchay, near Bristol; and in 1823 he went up to Trinity College, Cambridge, thence migrating to New Hall. His reputation at the university for scholarship stood high, but, being at this time a dissenter, he left Cambridge in 1827 without taking a degree, and commenced a literary career in London. He wrote a novel, Eustace Convey, and for a time edited the Athenæum, then reluctantly started. His spirit had, however, been profoundly stirred and influenced by Coleridge, and he resolved to take orders in the Church of England. He proceeded to Oxford, where he took the degree of M.A., and was ordained a priest in 1834. He became chaplain to Guy's Hospital in 1837; in 1842 he was elected professor of moral and political science at Oxford, and in 1844 he was made professor of Theology from 1846 till 1853. In 1846 he was appointed chaplain of Lincoln's Inn, and left Guy's Hospital. He continued chaplain of Lincoln's Inn until 1869, when he accepted the incumbency of Vere Street Chapel, which he held until his election as professor of moral philosophy at Cambridge in 1866. He died in London on 1st April 1872, and was buried at Highgate. The publication in 1853 of his Theological Essays, in which he dealt with the difficult and perplexing problem that Christ, lost him the professorship of Theology in King's College. The controversy turned on the doctrines of the atonement and eternal life. The atonement he declared to be not a terrible necessity but a glorious gospel, not of pardon for sin but deliverance from the prison of sin, that Christ's definition of life eternal he maintained was opposed to the popular doctrine, which he regarded as a mixture of paganism and Christianity. The views set forth in this and other works were in the belief that Christ was not the founder of 'a religion,' but 'the king of all the nations' where he least seems to rule; that Christ's church does not consist of a few privileged persons, but is the body which represents 'the marriage of the Lamb,' that marriage being the incarnation, or uniting of the Godhead with manhood; that the 'fall of Adam' is not the centre of theology, but an incident in the early education of the race, important only as representing the weakness of man apart from Christ, in whom he lives and moves and has his being; that the curse of Adam was the common experience of all men apart from God, resting on his own strength; that Christ came preaching 'the kingdom of heaven,' that is, the actual reign of righteousness in the world, the revelation of which is not contained in a closed book, but is always going on, and not backward but the renovation of an Eden of tropical fruits and easy culture, but forward to the cultivation by work and rest of all man's faculties unto the measure of the stature of the fullness of Christ; that faith consists in trust in this King of men, and belief in the power of right and the impotence, despite its seeming strength, of evil, not in the acceptance of formulae: that creeds, the Bible, the church, are valuable just in so far as they set forth Christ the King as the object of the faith of man; as substitutes for that faith they are only mischievous. His principal books are his Moral and Metaphysical Philosophy, Religions of the World, Prophets and Kings of the Old Testament, Pamphlets for the Protestant Church, and Maurice at once (1821) renewed the war with Spain. He died, unmarried, at The Hague, 23d April 1825. See Groen van Prinsterer, Maurice et Barneveldt (Utrecht, 1875).

Maurice of Saxony. See CHARLES V.

Maurier. See DU MAURIER.

Maurists, a reformed congregation of Benedictines, originally established in Lorraine, but from 1618 onwards named after the 6th-century St Maur, and established at the abbey of St Maur-sur-Loire, 14 miles NW. of Saumur. Originally noted for their modesty and poverty, they were especially known for their services to learning. The headquarters of the order was subsequently in three houses near Paris, especially St Germain-des-Prés. The congregation was dissolved with other monastic orders in 1792, and the splendid conventional buildings at St Maur destroyed during the revolutionary troubles. Amongst the learned fathers of St Maur were such scholars as Mabillon, Montfaucon, D'Achery, Martene, Rivet, Tassini, Bouquet, Rainart, Launi, and amongst the works published, besides admirable editions of the fathers, the Art de vérifier les ouvrages (1688), and Duensing's Glossarium, De Re Diplomatica, Acta Sanctorum S. Benedicti (9 vols. 1792), Annales Ordinis S. Benedicti (6 vols. 1739), Gallia Christiana, Veterum Scriptorum Ambrosiani Collectio, Histoire Littéraire de France, &c.

Mauritania, or MAURETANIA, the latter form that of the coins and inscriptions, was anciently the most north-western part of Africa, corresponding to the present Morocco and the western portion of Algiers. It derived its name from its inhabitants, the Mauri or Maurusli (see MOORS). It reached on the south to the Atlas Mountains, and was originally separated from Numidia on the east by the river Mulucha, now the Muluya, though at a later date it extended as far east as the Ampsaga. In ancient times it yielded great quantities of corn and valuable timber. See MOROCCO.

Mauritius, or Isle of France, an island in the Indian Ocean, belonging to Great Britain since 1810, and covered 550 miles E. of Madagascar. It is of volcanic origin and elliptical in shape. A girdle of reefs, broken only by passages opposite the mouths of the small streams, renders it somewhat difficult of approach. The contour rises rapidly into a tableland, that shoots up into ridges 500 to 2700 feet in height. Of individual peaks, Pouce (2650 feet) resembles the human thumb, Pieter Botte (2670), a sharp cone, supports a gigantic crag on its summit, and Riviere Noire (2711) is the culminating point of the island. Lava
and basaltic abound, and volcanic lakes, as Grand Bassin, are much mentioned. During the French occupation on the island of Mauritius, or, as they called it, isle of France, was well wooded. Its picturesque beauty forms the appropriate background of Bernardin St Pierre's idyl, Paul and Virginie, and is well described in Besnier and Rambaud. The novel, My Little Girl, was written down to make room for sugar-cane plantations. Consequently but little of the native flora remains. Most of that which now flourishes has been introduced. The more conspicuous trees and plants are the ebony, cotton, coconut, and other palms. The ebony is a valuable timber, aloë, the dragon-tree, and numerous tropical fruits, besides food plants, such as sugar, vanilla, coffee, cocoa, maize, rice, yams, manioc, &c. The existing fauna consists almost entirely of imported domestic animals. The extinct fauna embraced the interesting Dodo (q.v.), the Ailurodon Alphonseyrius, and a short-winged heron. Fossil tortoises of great size have been discovered. The birds resemble those of Madagascar; and the neighbouring seas swarm with fish. Owing to the deforestation of the island the rainfall is uncertain. Though the island享受s a hot continuous climate it is very hot during the rainy season (December to April or May), and terrific cyclones are common, though less common, it is believed, since the woods have been felled. At Port Louis the annual mean is 78° F.; but at Curepipe (1800 feet), the thermometer is generally 7° or 8° less, and the climate resembles that of the south of France. In 1854 the cholera carried off 17,000 people, and thirteen years later 50,000 perished of a malignant fever. The upper class, who were mostly descended from the old French colonists, except that the government officials, with a few others, are English. There is a large number of half-castes, and a considerable body of Negroes, Malagasy, Singalese, Malays, Canaries, &c. But the greater part of the population consists of Indian coolies, who work the sugar-fields. Pop. (1884) 359,874; (1891) 372,694, of whom 254,465 were Hindus. The people of European origin are mostly Roman Catholics (108,903); there are 8000 Protestants. On the northwest coast of the island, on the northwest coast, partly rained by the destructive cyclone of April 1892; Curepipe, to which the government and merchants of the capital retire in the hot season; and Mahébourg (4496) on the south coast. This last town is considerably less crowded than the preceding; the line then skirts round northwards to the mouth of Grand River on the east coast. These, with a couple of branch-lines in the south, make a total of 92 miles. The one great crop of the island is sugar, which is exported to the value of £1,907,600 on an average every year. Rum is also exported to the annual value of £18,000, cocoa-nut oil to £5490, vanilla £14,340, whilst the export of asafoetida (known in commerce as Mauritian hemp) has risen to £30,000 in some years. The total exports vary from £1,000,000 to £3,000,000, and the total imports from £1,500,000 to £2,000,000. Sugar, drugs, esencutchees, &c., are exported to Great Britain to the annual value of £228,780 in return for cotton and iron goods, coals, machinery, and clothing; to the annual value of £3,000,000. Mauritius, with its dependencies the Seychelles Islands, Rodriguez, Diego Garcia, and several minor islands, is administered by a governor, aided by an executive council. There is also a Council of Government, consisting of the crown colonists of twenty-one or more members, of whom ten are elected (since the amended constitution of 1885 came into force), nine are appointed by the crown, and eight are ex officio. There is a military force of about 600 men and a police force of 700. Besides 144 primary schools, there is the Royal College (188 pupils in 1888), with a couple of preparatory schools attached. Bishop Louis, and a Protestant bishop of Mauritius. The island was discovered by Masearenhas (whence it and the neighbouring islands are called the Mascarenes) in 1507; at that time it was uninhabited. The Portuguese having having abandoned it after nineteen years' possession, it was seized by the Dutch in 1598, who named it after their Prince Maurice (q.v.); but they in their turn abandoned it in 1710. It was the French governor Mahé de Labordonnais (1735-46) who introduced the sugar-cane, and laid the foundation of its prosperity as a colony, during the French occupation. Theodore Hook was treasurer in 1812-18.

See works by Grant (1801), Fleming (1802), Ryan (1864); Boyle (1867), J. G. Baker (1857), and L. Clark (1881).

Maurocordatos, or MAUROCORDATO, a Pan- 

ariote family, distinguished for ability and political 

influence, and descended from Chios and Con 

stance. ALEXANDER MAU 

"ROCORDATOS (écris 1637-1709) studied medicine in 

Italy, and, having a talent for languages and 

diplomacy, became dragoman or interpreter to 

the Porte in 1681, and rendered valuable service in the 

negotiations with Austria. For the rest of his life 

he was employed to undermine the power of the 

Wallachia. CONSTANTINE, son of Nicholas, be 

came hospodar of Wallachia in 1730, and abolished 

serfdom in that country. His brother's grandson, 

ALEXANDER MAUROCORDATOS, born at Con 

stantinople on 15th February 1791, took an active part 

in the Greek struggle for liberty, and prepared the 

declaration of independence and the plan of a pro 

vincial government, being himself elected presi 

dent of the executive body. Then he undertook 

in 1822 an expedition to Epirus, which ended in the 

unsuccessful battle of Ytea; but he saved the 

Peloponnesus from the Turks by his skill, and 

Missolonghi (1822-23). Notwithstanding the opposition 

of Colocotroni and Dimitrios Ypsilanti, he laboured 

earnestly in the cause of Greek independence and 

union. But unpopularity dogged his efforts, be 

cause he was a steadfast admirer of English policy 

and institutions, and a fierce opponent of the pro 

ussian government of Capo D'Istria. After the 

accession of King Otto, he was at different times 
cabinet-minister and ambassador of Greece at 

diverse courts. At the outbreak of the Crimean 

war he was placed once more at the head of the 

government. He died, at the age of 80, on 23rd 

January 1865.

Mauy, JEAN SIFFREIN, French orator and 

prelate, was born on 26th June 1746 at Valréas (dept. Vaucluse), and, his studies completed at Avignon, he went to Paris. Eloquent éloges on the dauphin, Charles V. of France, St Louis, St Vincent de Paul, and others gained him the favour of the Parlement and the Academy. In 1780 he was made prior of Lihou 

san-Satouer, and in 1783 was sent by the neighbours 

clergy to represent them in the States-general. Bold, confident, vehement, gifted with a magnifi 

cent voice and an imposing presence, and master of the resource of composition, he was the 

worthy rival of Mirabeau, and sometimes got the 

better of him in a parliamentary bout. At the
Maximilian

MAURY

Dissolution of the Constituent Assembly, he withdrew from public life, and even from France. The pope, admiring his devotion to Louis XVI., summoned him to Rome, made him Archbishop of Nizza in perpetuo, then cardinal (1794), and, besides bestowing upon him a valuable living, sent him to the papal legation to work for the liberation of the Emperor Francis II. In spite of his zeal for the Bourbons, Maury made his submission to Napoleon in 1804, and Napoleon in return appointed him grand almoner to his brother Jerome, and in 1810 chose him to be Archbishop of Paris. This step cost Maury his head, for Napoleon was jealous that of the Bourbons he had of course already lost. He consequently died in disgrace on 11 May 1817. Maury wrote Essai sur l'Eloquence de la Chaire (2 vols., 1810), "one of the best books in the language," his Oeuvres Choisies were published in 5 vols., in 1827. See Lives by his nephew, L. S. Maury (1857), Poujoulat (1833), and Ricard (1887); also Sainte-Beuve, Causures de Lundi, vol. iv.

Maury, Matthew Fontaine, an American naval officer, astronomer, and hydrographer, was born near Fredericksburg, Virginia, January 14, 1806. In 1825 he was appointed midshipman in the United States Navy, and during a voyage round the world in the Vincennes completed his well-known Navigation (1834), which was adopted as a text-book in the navy. After thirteen years' service he became lieutenant in 1837, but an accident two years later injured him for life. He devoted himself a long time to promotion of naval reform, and in 1842 was appointed superintendent of the Hydrographical Office at Washington, and two years later of the observatory. Here he carried out a system of observations on winds and currents, which enabled him to write his Physical Geography of the Sea (1856), and to produce in 1844 his works on the Gulf Stream, Ocean Currents, and Great Circle Sailing. In 1855 he was promoted to the rank of commander, but resigned his commission on the secession of Virginia, became an officer of the Confederate navy, and as such was sent as commissioner to Europe. After the war he lived some time in Mexico, but finally accepted the chair of Physics in the Virginia Military Institute at Lexington, where he died February 1, 1875. He was a member of the scientific circles in Paris, Berlin, Vienna, Petersburg, and may be considered almost as the founder of a new and important science. There is a Life by his daughter (New York and Lond. 1888).

Mausoleum, a sepulchral monument of large size, containing a chamber in which urns or coffins are deposited. The name is derived from the tomb crested at Halicarnassus to Mausolus, king of Caria, by his widow, Artemisia, in 353 B.C. It was esteemed one of the seven wonders of the world. Although apparently in good condition as late as the 12th century, it fell into decay during the following two centuries. The ruins were excavated by building materials by the Knights of St John in the 16th century. The site was rediscovered in 1857 by Newton, who was instrumental in getting the remains carried to the British Museum (q.v., Vol. II. p. 483). The mausoleum is octagonal on plan, and raised on a high, on which stood an Ionic colonnade 234 feet high, surmounted by a pyramid, rising in steps to a similar height, and on the apex of that stood a colossal group, about 14 feet in height, of Mausolus and his wife in the quadriga; these statues are supposed to have been executed by Scopas. Later instances of large and magnificent mausoleums are Metella's tomb, Hadrian's (Castle of San Angelo), and that of Augustus at Rome, the mausoleum of Frederick-William III. And Queen Louisa at Charlottenburg near Berlin, that of the House of Hanover at Herrenhausen, of the Prince Consort at Frogmore in Windsor Park, of Napoleon III. at Farnborough, and of A. T. Stewart at Garden City (q.v.), in the United States. The neighbouring villages of Frogmore and Farnborough are burdened with the mausoleums of American millionaires, one instance being the Lick (q.v.) Observatory; while magnificent structures mark the burial-places of such prominent men as Lincoln, Grant, and Garfield. See BURIAL, and other articles referred to there.

Mauvais Terres, or BAD LANDS. See Dakota (North and South), Wyoming.

Maune. See DYEING.

Mau-sced, a name by which poppy-seed is sold as food for cage-birds when molting.

Maxim Gun. See MACHINE GUNS.

Maximilian I., German emperor, the son of Frederick III., was born at Vienna-Neustadt, 22d March 1459. In his nineteenth year he married Marguerite, the heiress of Charles the Bold, Duke of Burgundy, whereby he acquired Burgundy and Flanders. But this involved him in war with Louis XI. of France, the French kings having for many years had covetous longings towards Flanders. After the death of his wife (1482) Maximilian was forestalled by Arthur, Duke of Burgundy to Louis. Nevertheless he continued to war against his enemy, in spite of the disaffection of his Flemish subjects. In 1486 he was elected king of the Romans. In 1490 he drove out the Hungarians, who, under Matthias Corvinus had seized (1487) a part of the Austrian territories on the Danube; and at Villach in 1492 he routed the Turks, who had been raiding in Carinthia, Carniola, and Styria. Charles VIII. of France having rejected Maximilian's daughter for Anne of Brittany, whose great possessions the emperor hoped to secure by marrying Anne himself, war was only averted by Charles ceding to his exasperated rival the county of Artois and Franche-Comté. On the death of his father in 1493, Maximilian became emperor. He subsequently married Bianca Sforza, daughter of Visconti, and Duke of Milan, and turned his ambition towards Italy. But his schemes failed: after various changes of fortune, and years of war, he was compelled (1515) to give up Milan to France and Verona to the Venetians. Nor was he more successful against the Swiss, who in 1499 completely separated themselves from the German empire. The hereditary dominions of his house, however, were increased during his reign by several peaceful additions, chief amongst these being Tyrol; and the marriage of his son Philip with the Infanta Joanna united the houses of Spain and Hapsburg; whilst the marriage in 1521 of his grandson Ferdinando with the daughter of Ladislaus of Hungary and Bohemia, brought both these kingdoms to Austria. Two years after his accession the new emperor put an end to the intestine feud of his nobles by proclaiming at Worms the Eternal Peace. He also improved the administration of justice by establishing the Imperial Tribunal and the Imperial Apical Council, and by admirable police regulations. The empire was divided into six (afterwards seven) circuits, and a universal government. Maximilian greatly encouraged the arts and learning, and especially favoured the universities of Vienna and Ingolstadt, and caused at least two works to be written under his own personal direction, Thewerrank in verse and Weisheit in prose, both of which are the title of the hero. He died at Wels, in Upper Austria, 12th January 1519. Besides being excellently schooled in mental and artistic accomplishments, Maxi-
Maximilian, EMPEROR OF MEXICO. Ferdinand Maximilian Joseph, Archduke of Austria, was born on July 6, 1832, and was the son of the Archduke Francis Charles, and the younger brother of Francis Joseph. He became an admiral of the Austrian navy, and in 1857-59 he was Popular Governor of the Lombardo-Venetian territory. In 1862 the French were induced to interfere in the affairs of Mexico, and in 1863 called together an Assembly of Notables, which offered the crown of Mexico to Maximilian. After deliberation he solemnly accepted it; and in June 1864 he entered Mexico. For a time all went well, but he vainly tried to reconcile the Mexican parties. Juarez (q.v.) again raised the standard of independence; and soon after (1866) Louis Napoleon had to contemplate the withdrawal of his troops. In vain the Empress Charlotte, a daughter of Leopold I., of Belgium, offered to entice his heart; she was not his husband; her reason gave way under the continued grief and excitement brought on by disappointment. The French were most anxious that Maximilian should leave with their troops; but he felt bound as a man of honour to remain, and share the fate of his followers. At the head of 800 men he made a brave defence of Queretaro against a Liberal army under Escobedo. In May 1867 he was betrayed and tried by court-martial, and on June 19 he was shot. His body was conveyed to Europe in an Austrian frigate, and he was laid to rest in the sand directly by his own fatal edict of October 3, 1865, that all Mexicans taken in arms against the empire should be shot without trial. After the death of Maximilian, his writings were published under the title of Aus Meinem Leben; Reisezirkus, Aphorismen, Marinerbilder (7 vols. 1867). See MEXICO.

Max-Müller, FRIEDRICH, philologist, was born at Dessau, in the duchy of Anhalt-Dessau, 6th December 1823. His father, Wilhelm Müller, displayed exceptional activity and thoroughness. He was the first German poet, who was Converso, and his extensive and thorough scholarship, but as one of the first German lyric poets, was librarian of the ducal library, but died prematurely, October 1827. Max-Müller received the elements of his education at Dessau, and then went to Leipzig, where he studied Greek and Latin under Hermann and Haupt, and took his degree in 1843. He began the study of Sanskrit under Professor H. Brockhaus, and soon chose it as his special pursuit. The first fruits of his labours appeared in a translation of the Bhagavata Purana (1842-44). In 1844 he went to Berlin to study under Bopp and Schelling, and consult the Sanskrit MSS. to be found there. In Paris, whither he repaired in 1845, he began, at the instigation of Burmont, to prepare for an edition of the Rig-Veda, with the commentary of Sâyândâéra. With this view he came to England, June 1846, to examine the MSS. in the East India House, London, and the Bodleian Library at Oxford; and, on the recommendation of Professor H. H. Wilson, the East India Company commissioned him (1847) to edit the Rig-Veda at their expense (6 vols. 1849-74; new ed. 1890). In 1850 Max-Müller was appointed Professor of Modern Languages at Oxford; in 1854 he succeeded to the professorship; in 1858 he was elected a Fellow of All Souls; and in 1866 was made professor of Comparative Philology. Max-Müller has published treatises on a variety of philological topics, which have done more than the labours of any other single scholar to awaken in England a taste for the science of language in its modern sense. Inheriting the poetic imagination and fire of his father, Max-Müller has at command a fervent and illuminating style that, if the dry under ordinary treatment becomes in his hands attractive. He has published a translation into German of Kalâda's Maha-daita (1847); The Languages of the Seat of War in the East (1854); Comparative Mythology (1856); History of Sanskrit Literature (1858); Lectures on the Language of the Upanishads (1861-63); Lectures on The Science of Religion. Other works were Chrysan from a German Workshop (4 vols. 1868-75), the Hubbard Lectures on The Origin and Growth of Religion (1878), Selected Essays (1881), and Biographical Essays (1883). A novel written in German, Deutsche Liebe, which has gone through many editions, is attributed to him. He edited the important series of The Sacred Books of the East. In 1888-92 he delivered at Glasgow the Gifford Lectures published as Natural Religion, Physical Religion, and Theology of the Bible, Physical Religion. He was one of the eight foreign members of the Instituto of France; F.L.D. of Cambridge, Edinburgh, and Bologna; a Commander of the Legion of Honour (1896); and a Member of the Privy Council (1896). He died at Oxford, 28th October 1900. See his And Lang Syne (1898). See MEXICO.

Maxwell, JAMES CLERK, one of the greatest of modern natural philosophers, was the only son of John Clerk-Maxwell of Middletie, in Dunfries-shire, and was born at Edinburgh, June 13, 1831. He was educated in boyhood at the Edinburgh Academy. His first published scientific paper was on for his friend Professor Andrews. He was a Fellow of the Royal Society of Edinburgh before he was fifteen. He spent three years at the university of Edinburgh; and during this period he wrote two valuable papers, 'On the Theory of Rolling Curves,' and 'On the Equilibrium of Elastic Solids.' He went to Cambridge in 1850, obtained in 1854 the position of second wrangler, and was declared equal with the senior wrangler in the higher order of the Smith's prize. In 1856 he became a professor in Marischal College, Aberdeen, and in 1860 in King's College, London. In 1865 he was elected a fellow of Trinity, and was elected an Honorary Fellow of Trinity when he finally became in 1871 professor of Experimental Physics in the university of Cambridge. He died November 5, 1879.

The great work of his life is his treatise on Electricity and Magnetism (2 vols. 1873). His great object was to construct a theory of electricity in which 'action at a distance' should have no place; and his success was truly wonderful. There can be little doubt that he succeeded in laying the basis of a physical theory of electric and magnetic phenomena, which is known as the magnetic or undulatory theory of light (see Nature, vol. vii. p. 478). Another subject to which he devoted much attention was the perception of colour, the three primary colour-sensations, and the cause of colourblindness. He was the first to make colour-sensation a subject of scientific treatment. He obtained the Adams prize for his splendid discussion of the dynamical conditions of stability of the ring-system of Saturn. But he was perhaps best known to the public by his investigations on the kinetic theory of gases. His Bradford 'Discourse on Molecular Kinetic Theory' is a classic in that subject. He obtained a number of papers on various subjects, mathematical, optical, dynamical, he published an extraordinary text-book of the Theory of Heat and an exceedingly suggestive little treatise on Matter and Motion. In 1879 he edited, with copious and very valuable original
Mayaguez, a city and seaport of Porto Rico, on the west coast, 70 miles SW. of San Juan. It exports sugar, molasses, coffee, hides, fruit, and turtle-shell. Pop. (1899) 15,187.
Maya's. See American Indians.

Maybole, a town of Ayrshire, 33 miles inland, and 9 by rail S. by W. of Ayr. In feudal times it was the capital of Carrick, and has been a borough of barley. It has several large mansions, a town-hall, and a fine Roman Catholic church. Shoemaking is the staple industry. Nearby is the famous Crossmichael (q.v.) abbey. Pop. (1891) 5470.

Mayence. See Mainz.

Mayenne (Lat. Mediana), a French department formed out of the old provinces of Maine and Anjou, now containing the arrondissements of Laval, Château-Gontier, and Mayenne, has an area of 1906 sq. m. and a pop. of (1886) 340,063; (1891) 332,387. The valleys of the Mayenne, Vilaine, and Sarthe are fairly fertile, and yield wheat, barley, flax, potatoes, hemp, and fruit (especially apples for cider). Cattle-breeding, coal and slate mining, and cotton spinning and weaving are the other chief industries. Chief-town, Laval.—The river Mayenne, after a course of 127 miles in a southerly direction, joins the Sarthe at Angers to form the Maine, a tributary of the Loire. It is navigable up to Laval.—The town of Mayenne, on the right bank, is 12 miles long by 4 broad. It has, by Caen, has a picturesque ruined castle (taken by the English in 1424), steep narrow streets, and manufactures of calico and linen. Pop. (1872) 8790; (1886) 9940; (1891) 10,438.

Mayer, Julius Robert von, physicist, was born at Heilbronn, 25th November 1814, studied medicine at Tübingen, Munich, and Paris, began life as a ship's surgeon, and settled in his native town to practise his profession in 1841. Whilst at Batavia in 1840 his attention was first attracted to the studies he afterwards pursued in every interval of leisure. In 1842 he published in Liebig's Annalen a preliminary statement of the mechanical theory of heat, in which he clearly determined the numerical relation between heat and work. Three years later he restated his views with admirable clearness and with a great wealth of illustration, and at the same time gave a forecast of his theory of the meteoric origin of the sun's heat, elaborated in 1848. Contemporaneously with Mayer the mechanical theory of heat was worked out independently by Joule (q.v.) in England. Nevertheless a controversy arose as to the priority of discovery. The Royal Society gave him the Copley medal in 1871, and he was elected professor of the University of Württemberg two years before his death, on 29th March 1878. Mayer's papers were collected under the title Mechanik der Wärme (2 ed. 1874), and his Correspondence appeared in 1889.

Mayhem. See Assault.

Mayhew, Augustus (1826–75), author, wrote in conjunction with his brother Henry ("the Brothers Mayhew") several notable works of humorous fiction, the best of which are named in the article below. In addition to his, the better-known part of his work, he wrote on several stories which were popular at the time—Paved with Gold (1857), The Finest Girl in Blossomary (1861), Faces for Fortunes (1865), &c.

Mayhew, Henry, journalist and litterateur, was born in London in November 1812. He ran away from the Westminster School in consequence of unjust treatment, was sent on several errands, and on returning was article to his father, a solicitor. Mayhew's first adventure in literature was the starting, in conjunction with Gilbert Beckett, of The Cerberus, the production of which was stopped by Beckett's father. The two youths in disgust left their homes, and with but fifteen shillings between them walked to Edinburgh, hoping to sell their verses to the newspapers at the theatre of which Mayhew's brother Edward was lessee; this failed, for they were at once sent back. In 1831 they started Figaro in London, and the year following The Thief, which was the prototype of the immortal "Whit's End" journals of to-day. In 1850 Mayhew produced The Wandering Minstrel, a farce, and shortly after joined with his brother Augustus in one of the most successful of literary partnerships, during which (as "the Brothers Mayhew") they produced some remarkably clever works (chiefly of fiction), the best result of which was that turned Everything to Gold (1847), The Greatest Plague of Life (1847), The Image of His Father (1848), Whom to Marry (1848), The Magic of Kindness (1849), Living for Appearances (1850). One of the originators and first editor of Punch, Mayhew was from early in the "forties" a voluminous writer on many subjects—as on The Peasant Boy Philosopher (1854), The Wonders of Science (1858), Shops and Companies of London (1863), London Characters (1874), and The Criminal Prisons of London. The work by which Mayhew will perhaps be best remembered is his History of London, Past and Present, and the London Poor (1851, &c.). Henry Mayhew, who had married in 1844 the elder daughter of Douglas Jerrold, died on July 25, 1887.—Horace Mayhew (1816–72), brother of the two foregoing, also made some mark in literature, more especially of a humorous and ephemeral kind. He was a constant contributor to Punch, of which he was at one time sub-editor.

Maynooth. a village of County Kildare, Ireland, 16 miles NW. of Dublin by rail; pop. (1891), including the college, 1174. It is of historical interest as the seat of the Galdines, of whose castle striking ruins still remain; and as the scene of more than one struggle with the English power, especially the 'Rebellion of Silken Thomas,' in the reign of Henry VIII., and in the war of the Confederates (1641–50). But its chief modern interest arises from its Roman Catholic college, established (1795) by an act of the Irish parliament during Pitt's ministry, to meet a necessity created by the destruction, through the French Revolution, of the places of education in France, upon which the Irish Catholic clergy, excluded by the penal laws from the Continent, had been accustomed to rely. The original endowment, an annual vote of £6928, was continued, although not without controversy and keen opposition on the part of zealous Protestants, by the imperial parliament after the act of union. In the year 1846 Sir Robert Peel carried a bill for a permanent endowment of £20,000 a year, to which was added a grant of £30,000 for building purposes. The building erected under the original endowment is a plain quadrangle. The new college is a very striking Gothic quadrangle by Pugin, containing professors' and student's chambers, lecture-halls, and a singularly fine library and refectory.

Under the Act of 1845 the college was to receive 500 students, all destined for the priesthood. The patronage of the 500 studentships was divided in the ratio of population among the bishops of the several see in Ireland: the candidates were subject, before matriculation, to a comprehensive entrance examination. The full collegiate course was of eight years, two of which were given to classics, two to philosophy, and the remaining four to divinity, scripture, church history, canon law, and the Hebrew tongue. Irish language students, 250 in number, received a money stipend of £20 annually; and at the close of the ordinary course, 20 'Dundowe Scholarships' were assigned.
by competition to the most distinguished students, and might be held for their benefit. The legislative authority was vested in a board of seventeen trustees, and the internal administration in an academic body, consisting of a president and vice-president, together with a numerous body of professors and deans. Of a board of eight visitors, five were annually chosen by the crown, and three elected by the trustees.

In 1869, by the Irish Church Act, the Maynooth endowment was withdrawn—a capital sum, fourteen times its amount, being granted to the trustees for the discharge of existing interests. The college, however, retained the plate, buildings, and landed property of about £5,000, and dedicated the revenues to students, and although the number of pupils, owing to the suspension of free studentships and exhibitions, fell off somewhat for the few years immediately succeeding the disendowment, the diminution was only temporary. In recent years the average number of students in residence has been 500. The visitatorial powers created under the act of parliament are now exercised by visitors appointed by the trustees, and all state connection is at an end. The college also possesses some landed and funded property, the latter being used for the support of the college until 1890. Designed by the late J. J. McCarthy in the Decorated Gothic style, it consists of a great nave, choir, and sanctuary, ending in a five-sided apse, from which radiate five chapels. The entire length is 220 feet, the width 40 feet, the height from floor to greatest arch 70 feet. The sides of the chapel are flanked by cloisters which externally present the appearance of aisles. The interior is richly fitted as a collegiate chapel, with 450 choir-stalls of finely-carved oak, mosaic pavements of varied devices, altars of Carraram marble, rich painted glass, and a sweet-toned organ. A great part of the college was burned in 1878, but was soon restored.

See Maynooth: a Centenary History, by the Most Rev. Father Healy (1865).

Mayo, a maritime county of the province of Connacht, Ireland, is bounded on the N. and W. by the Atlantic Ocean, and on the E. by the counties of Mayo and S. by Galway. The greatest length north and south is 63 miles; the greatest breadth, 57 miles. Area, 1,360,731 acres, of which nearly 26 per cent. is bog and 18 per cent. barren. Of the remainder there are 70,000 acres from 50,000 to 60,000, potatoes and other green crops somewhat more, the rest being in pasture. Pop. (1841) 388,887; (1851) 254,799; (1861) 245,212, of whom 238,262 were Roman Catholics; (1891) 219,034. The rearing of cattle and agriculture are the leading industries. The eastern half of the county is more or less a plain, the western half mountains, the highest peaks being Mulleran (2683 feet), Nephin (2539), and Croagh Patrick (2370). Ironstone abounds, but owing to want of fuel has not been worked; and there are several valuable slate-quarries. The chief towns are Castlebar (3885), Westport (4469), Ballina (5760), including 1442 in County Sligo), and Ballinrobe (2286). The coast-line of Mayo is about 250 miles, and is greatly indented, Killala, Ballycastle, and Castlebar being considerably so. The chief rivers are the Moy and the Mogue, being the only ones of any size on this coast. Off Mayo, too, lie the islands Achill (34,283 acres), Clare (3960), and others. Loughs Mask and Corrib lie on the southern border, and Loughs Conn, Castlebar, Culleen, Carragh, Corramore within the county. A valuable salmon-fishery exists in the river Moy, and Lough Mask is the home of the 'gillarrow' trout. The Irish language was in 1881 spoken by 8808 persons who did not know English, and by 188,932 who did. Four members are returned to the House of Commons.

Mayo formed part of the extensive territory granted by King John to Hubert de Burgh; but William, the third earl, seizing Galway and Mayo, the latter of which he called the 'estates of the Irish,' together with the Celtic name of Mac-William. The district was not subdued until 1536. The antiquities of Mayo are chiefly ecclesiastical, there being many ruins of monasteries. Four round towers exist, and at Castleconnel is a supposed remnant of the 12th century abbey known as the 'Cross of Cong,' now in the museum of the Royal Irish Academy, was made at Roscommon in 1120.

Mayo, Richard Southwell Bourke, Earl of, Indian statesman, was born in Dublin on 21st February 1822, and educated at Trinity College, Dublin. He entered the House of Commons as a Conservative in 1847. He was appointed Chief-justice of Ireland by Lord Derby in 1852, 1858, and 1866. In 1868 he was sent out to succeed Lord Lawrence as Viceroy of India. He discharged the duties of his office with earnest zeal and uniform courtesy, administered justice, and treated friends and neighbours with the same consideration. The Indian government, in gaol discipline, in irrigation works, and in providing educational facilities for the native Mohammedan population. While inspecting the convict settlement at Port Blair on the Andaman Islands, on 8th February 1872, he was fatally stabbed by a Punjab fanatic. See Life by Sir W. W. Hunter (2 vols. 1875).

Mayonnaise, a thick cold sauce for salads, cold meat, poultry, fish, vegetables, &c., made of the yolks of eggs, salad-oil, and vinegar, with a little salt, cayenne pepper, and meat-jelly; it is sometimes coloured red with powdered lobster coral, or green with spinach or parsley.

Mayor (Fr. maire, Lat. major; see MAJOR), originally a steward, bailiff, or overseer, thence the chief-magistrate of a chief-magistrate of a city or a county in Ireland. The mayor is the head of the local judicature, and the executive officer of the municipality; he is elected by the council from the aldermen or councilors, and holds office for a year only. His duties include those of returning officer of cities, and all boroughs except those cities and towns whose being being counties of themselves, have sheriffs of their own. The first Mayor of London was appointed in 1189, the first Mayor of Dublin in 1409. The mayors of London, York, and Dublin, and since 1890-95, of Liverpool, Manchester, Leeds, Sheffield, and Birkenhead, are called Lord Mayors. The Lord Mayor of London (q.v.)—since 1545 'Right Honourable'—is the representative of royalty in the civil government of the city, the chief-commisar of lieutenancy, the conservator of the river Thames, and on the demise of a sovereign is summoned to attend the Privy-council. To sustain the hospitality of the city he receives an allowance of £5000 a year, with the use of the Mansion House (q.v.), furniture, carriages, &c. He is chosen by the Livery (q.v.) on the 29th September, and if he is not already 'passed the chair.' Although the office is still one of dignity, it is only in the eyes of foreigners that the Lord Mayor of London is one of the most important public functionaries of the realm. The Mayor of Dublin by charter II. In 1665. The title of Mayor is used to denote the chief officer of a city in the
MAYOTTE

United States and the British colonies, in France the Maires is first officer of a town, commune, or district. For the Mayor of the Palace, see PEPIN. See also Provost.

Mayotte, one of the Comoro Isles (q.v.).

Mayville, capital of Mason county, Kentucky, on the Ohio River, 60 miles by rail NE. of Lexington. It is the river-port of a rich territory, contains many mills, distilleries, &c. Pop. 6423.

Mayweed, or Stinking Camomile (q.v.).

Mazanet, a town in the French department of Tarn, on the Arnette, 43 miles SE. of Toulouse, and 12 by rail SSE. of Castres. It has extensive woolen manufactories. Pop. (1891) 14,151.

Mazanderan, a province of northern Persia, fringing the Caspian Sea, for some 200 miles and lying between the provinces of Gilian and Astrakhan, consists of a belt of low marshy coast-land, 10 to 20 miles wide, backed by the well-wooded northern slopes of the Elburz. The climate is very changeable, in summer both rainy and unhealthy, but on the uplands fairly salubrious. Owing to the fertility of which is increased, the numerous small rivers, the Persians call the province the "Garden of Iran." Rice, wheat, and other cereals, cotton, mulberry-trees, and a variety of fruits are produced. Horses, asses, and camels are extensively raised. Rice, hemp, indigo, oxalic acid, wool, poultry, eggs, 300,000. The chief town is Sari, though Barfarun (see BALFRUSH) is the seat of the trade with Russia. Iron ores and mineral oils are very abundant.

Mazarin, Jules (Giulio Mazzarini), cardinal and chief minister of France during the minority of Louis XIV., was born 14th July 1602, at Pescina, in the Abruzzi. He studied under the Jesuits at Rome, and went to Axila in Spain, where he relieved the tedium of study with love-making. He next entered the military service of the pope, but his ability for diplomacy was early recognised. Having accompanied a papal legate to the court of France, he became known about 1625 to Richelieu, who divined his promise and engaged him to maintain French interests in Italy, which he did while still employed by the pope as vice-legate to Avignon (1632), and nuncio to the French court (1634-36). In 1639 he openly entered the service of Louis XIII., and was naturalised a Frenchman; and two years later he received cardinal's hat, with the influence of Richelieu, who before his death (4th December 1642) recommended Mazarin to the king as his successor. His position was one of great difficulty amidst the intrigues and jealousies of the time, and the first necessity was that he should make himself indispensable to the queen, who became regent on her husband's death in May 1643. But Mazarin was one of the most supple courtiers that ever bowed the knee before a throne, and moreover he knew how to touch a woman's heart by his romantic devotion. So he kept his place as minister, and it is certain, from his famous Journals and many of the BUTI letters, that the queen gave him her love, if it cannot with certainty be proved that there was a private marriage between them. It should be remembered that this was perfectly possible. St. Charles and his parliament, thinking to dinal had never taken more than the minor orders, of which a man could easily divest himself. Mazarin possessed admirable faculty for affairs and so much personal charm that he ruled with greater smoothness than Richelieu, although with almost as unlimited a sway. The cardinal had never regained political power, resisted the registration of edicts of taxation; but Mazarin caused the leaders of the opposition to be arrested (August 1648), upon which the disturbances of the Fronde (q.v.) began. The court retired to St. Germain, but at length tripped by the aid of Condé, and the true of Ruel, while it removed the obnoxious taxes, left Mazarin and his subjects enriched in other respects. He, however, blazed out anew in the provinces, when at his instigation the queen-regent arrested Condé, Conti, and Longueville in January 1650. Mazarin triumphed at Rethel, but soon had to succumb to the strength of the combination against him and sanctioned the flight of Nós and the press deemed with pamphlets and satires against him—the famous Mazarinades, few of which, however, attained the dignity of literature. The cardinal now perceived the fatal consequences of his policy of isolating himself and the queen from every party in the state, and bent all his energies towards intrigue to form a new royal party. Turenne was gained over, and his military genius proved more than adequate as a counterpoise to the opposition of Condé. After one year's absence Mazarin returned to court in January 1652, but eight months later again retired to Sedan to admit of a reconci- llation with the parlement of Paris. At length in February 1653 he returned in triumph to Paris, and thereafter his power remained secure, while he quickly regained all his popularity. Under his rule the influence of France was increased. He gained the alliance of Cromwell at the price of Dunkirk; secured the preponderance of French influence in southern Germany by the treaty of Westphalia (1648), and the league of the Rhine, formed in 1659; and by the treaty of the Pyrenees (November 7, 1659), and the marriage of Louis XIV. with the Infanta Maria Theresa, brought the succession to the throne of Spain within the range of French ambition. Mazarin died at Vincennes, 9th March 1661, leaving an immense fortune, variously stated at from 18 to 40 million livres. After his death the unfortunate Louvois, who had long been passed freely at the disposal of the public, was bequeathed to the Collège Mazarin. His name survives characteristically in the 'Mazarin Bible,' one of the most priceless treasures of Bibliomania (q.v.). He celebrated three of those whom he brought from Italy to the French court present all the possible contrasts of character and destiny. The eldest of the seven, the virtuous Laura Mancini, married the Duc de Mercœur, son of Henry IV. and Gabrielle, and died young. Anne-Marie Martinnuzzi, her cousin, married the Prince de Conti, and gloomy lunchback, and also died young. Laura Martinuzzi mounted a throne by marrying the Duke of Modena, and became mother of the second queen of James II. of England. Olympe Mancini, who became Contesse de Soissons, was a woman formed for great crimes, whose true place would have been in the palace of the Caesars or the Vatican of the Borgias. She plunged deep into a series of discreditable intrigues, and found herself obliged to flee from France to escape the punishment of a poisonous. After fitting a woman like an evil genius over the face of Europe, she died poor and obscure at Brussels. Hortense Mancini, the most beautiful of the seven, and her uncle's favourite, inherited his fortune, and was sought in marriage by the Duke of Savoy, the Prince of Portugal, the Duke of Orléans, but the cardinal married her to the Duc de la Meillerie, who took the name and arms of Mazarin. He was a gloomy bigot, who mutilated with the fury of a Byzantine leonocatas the magnificent antique statues which Mazarin had collected with all an Italian's love for art, shut up his wife, and died her with a judicial severity which afforded the morality of the time ample justification for her misconduct. She found at once a refuge from his pursuit in England, and a characteristic recreation in an intrigue with Charles II. Marie-Anne Mancini became Duchess of
de Bonillon, and was the generous patroness of Lafontaine and other men of letters. Her reputation was not spotless, but her wit brought her off triumphantly from an examination for sorcery before the Chambre Animata which her sister could not face. Marie Mazzini, the eldest of the seven, was beloved by Louis XIV., who would have married her but for the self-denying opposition of his great minister. She found shelter but not consolation in the arms of Prince Colonna, one of the jealous husbands of old Italian story. She fled from his severity to Provence, to Rheims, and to Spain, but was at last secured and enslaved into submission.

See the Memoires of such contemporaries as De Retz, Madame Motteville, La Rochefoucauld, Taranne, Grammont, and other contemporaries. He became a page at the court of John Cazimier, king of Poland. A Polish nobleman, having surprised him in an intrigue with his wife, caused him to be stripped naked, and bound upon his own horse, lying upon his back with his head tied to its tail, and let the animal loose, leaving Mazzini to wander to the four quarters of the Urkaine, according to the usual account. A more credible story is that his horse carried him through woods and thickets and brought him back to Rome and, in the end, to his own home. Mazzina now joined the Cusanace. became secretary to her father, Samaioch, and in 1687 was elected his successor. He won the confidence of Peter the Great, who loaded him with honours, and made him Prince of the Ukraine; but, on the cullination of his career in Russia, Mazzina conceived the idea of throwing off the sovereignty of the czar, and for this purpose entered into negotiations with Charles XII. of Sweden. His treason was revealed to Peter the Great, who endeavored to credit it, but after Pultowa ordered his effigy to be burned on a gallows, and his capital, Baturin, to be razed to the ground. Mazzina's hopes perished in the disaster of Pultowa (1709), and he fled with Charles to Bender, where he died miserably the same year. His story is the subject of a famous poem by Byron, of a novel by Balgarine, and a drama by Gottschall, of two paintings by Vernet, and of a masterly historical work by Kostomaroff (1852).

Mazaruka, a lively Polish round dance, the music of which is generally in 2 time. The peculiar- arity of the rhythm, which has a pleasing effect, is what characterises the music of the Mazaruka. It is danced by four or eight couples, and is much practised in the north of Germany, as well as in Poland, from whose province Mosavi it gets its name. 

Mazzari, a walled cathedral city of Sicily, 32 miles by rail S. of Trapani, stands in a fine plain on the seashore. Pop. 13,074.

Mazzarino, a town of Sicily, 15 miles SE. of Caltanisetta. Pop. 12,964.

Mazzini, Giuseppe (English, Joseph), Italian patriot and republican, was born at Genoa, 22d June 1805. Mazzini, proceeding to Paris, proceeded to study at the university of his native town, when only thirteen, and before he was nineteen was practising as an advocate. In April 1821 his heart was deeply stirred and his imagination fired through seeing refugees from the unsuccessful rising in Piedmont, and from that moment he conceived the idea of the liberation of his country. At first he assailed the domination of the classical school of literature, and its "monarchical" tyranny of rule and prescription. But the earnestness of his nature soon pushed him on to the great sacrifice of his life, by renouncing the career of the law, and making the direct path of political action. In 1829 he joined the Carbonari (q.v.), although he mistrusted their aims, their methods, and the character of their organisation. He was betrayed in July 1830 to the Sardinian soldiery, and imprisoned in Savona. In his prison cell he matured those thoughts which led became the ruling principles of his life and work, and shortly after his release, early in the following year, organised at Marseilles the Young Italy Association. The first and last duty of its members was to labour to create a free, independent, and united nation of Italians. The great mass of the people were to be educated to understand their rights, and taught to obtain them, if need were, through insurrection. But Italy must first be freed from the yoke of the foreigner. Nothing but a republic could serve her foreigner. Nothing but a republic could serve her. Once Italy were regenerated, she was destined to arise the initiatrix of a new life, and of a new and powerful unity to all the nations of Europe—the selfsame role that Heine and Young Germany were assigned to play. The ultimate goal was the governance of the world by the moral law of progress, through the effective agencies of association, man with man and nation with nation. The labour to be undertaken was not merely political, but above all a moral work; not negative, but religious. It was essentially the practice of a faith, the living of a creed, a religion. It was in this spirit that Mazzini laboured to his life's end—unwaveringly, disininterestedly, through the bitterest humilliations of exile, and at the cost of the greatest personal sacrifices.

Shortly after Charles Albert ascended the throne of Piedmont (April 1831) Mazzini addressed to him a manly appeal, urging him to put himself at the head of the struggle for Italian independence, and to grant needful concessions to his people's cry for liberty. He was refused a hearing more than twenty years. A life of voluntary imprisonment within the four walls of a little room. But no confinement could quell his spirit or restrain his activity. Henceforward he was the most untiring political agitator of Europe, and one of the most unscrupulous in the use of his influence to further the cause of free constitutions; with Lassalle he was one of the most conspicuously successful of the century. He wrote incessantly, in a strain of such fervid eloquence,
and with such an intensity of conviction, that his words kindled in the hearts of those that read them the enthusiasm to do and to sacrifice all things. Though by nature frank, bold and bold, no man perhaps learned to understand better the tortuous arts of secret conspiracy. He was driven to adopt this underground method of warfare by the power and vigilance and unscrupulous character of the enemies of the Revolution organization, which, though not at first a United front as they presented to every revolutionary assault. In 1834 he organised an invasion of Savoy, which failed ignominiously, chiefly through the lukewarmness, if not treachery, of the soldier placed at its head. The next two years Mazzini spent in Switzerland, incessantly active, extending his organisation throughout Italy, instigating his countrymen to insurrection, and scattering broadcast through Europe the bursting seeds of republican revolt. In the year of the Savoy fracas he drew up, at Bern, for Young Europe—i.e. Young Germany, Young Italy, and Young Poland—the Poet of Fraternity, a code of abstract doctrines dictating to humanity a faith and rules of life. Being in the last days of 1836 banished from Switzerland, he found a refuge in London. Although for some years (1841-48) he struggled harmless, he was afterwards able to help his poorer, ignorant countrymen, the organ-boys of London, by gathering them round him in night-clases and teaching them and civilising them. In 1844 he charged the English government with calumny, and communicating their contents to the rulers in France and made good his accusation. This raised a great storm of indignation throughout the country, and drew from Carlyle a spirited testimonial to Mazzini in The Times. Sir James Graham, the Home Secretary, felt so aggrieved by apologising in the House of Commons for having publicly repeated the calumnies of his enemies.

On the outbreak of the Lombard revolt in 1848 Mazzini hastened to throw himself into the thick of the struggle. The king of Sardinia sought to win him over by the promise to make him first minister in the new Piedmontese-Lombard state, and to grant him as large a share as he might desire in the framing of a constitution for it. But Mazzini's aims were not of personal ambition, and he would be no party to the aggrandisement of the dynasty of Savoy, who had been responsible for the downfall of the united Italy. After Milan capitulated, he tried with Garibaldi to keep the war alive in the valleys of the Alps; but, when he saw that all was over in Lombardy, he made his way to Tuscany. Leghorn received him with wild enthusiasm on 8th February 1849, the day before the republic was proclaimed at Rome, and elected him her deputy to the republican assembly in the papal city. On 29th March Mazzini, Saffi, and Armellini were appointed a triumvirate with dictatorial powers; they chose as their motto "God and the People." But on 25th April the French arrived before the city to reestablish the government, and after a tough struggle were admitted within the walls. The republic fell, and the triumvir indignantly resigned on the last day of June. Mazzini made his way back to London. Not however many months later, he was organised about this time in England. In 1850 Mazzini condemned the alliance Piedmont had made with Napoleon III.; and the cession of Savoy and Nice to France not only justified his prophetic warning, but filled him (and Garibaldi) with the patriot's sorrowful indignation.

He supported Garibaldi in his expedition against Sicily and Naples with all his influence and all his resources. He saw in them the fruits of the soldier's heroic exertions, and even scattered his followers and took him prisoner at Aspromonte (1862), Mazzini broke finally with the monarchical party. The king replied to his fulminant by again passing sentence of death upon him—the third time. But this did not deter him from agitating the Convention of September (see ITALY) as a base compromise. In 1866-67 Mazzini in protest elected him its deputy to the Italian parliament four times in succession. Two years later he was again expelled from Switzerland, and in the following year (1870) he was arrested at sea, whilst on his way to Sicily, and carried prisoner to Gaeta. After being detained two months he was set at liberty. He settled at Lugano, but died at Pisa, 10th March 1872, and was buried in his native city, mourned by the entire nation he had done so much to create.

Although from one point of view a utopian idealist and political dreamer, the apostle of the new democratic evangel, and from another point of view a restless demagogue, a dark conspirator, and disturber of the peace of Europe, Mazzini must be counted among the great statesmen and diplomats. His was the spirit that burns the bridges behind it; stakes all on one critical throw, and puts forth all its energy to bring about a decisive and final result. Cavour was of an opposite temperament: he was essentially the cautious, calculating statesman. Hence the fundamental antagonism between the two men. Cavour was a man of aristocratic birth and training, and the levelling doctrines of the new republicanism were in the highest degree repugnant to him. No wonder then that he disliked Mazzini, the ardent apostle of equality, fraternity, and humanity, the uncompromising enthusiasm of the moderates, the calm, cautious watchers and waiters for opportunities. He was averse to nipping advantage after advantage, and had no sympathy for the compromises and half-measures of the statesmen and diplomatists. His was the spirit that burns the bridges behind it, stakes all on one critical throw, and puts forth all its energy to bring about a decisive and final result. and Thoughts upon Democracy in Europe, a discussion of the prominent schools of economics and socialism. Apart from his eloquence, the features of his writing that most forcibly arrest attention are his manly, outspoken tone, his candid fairness —collected edition of his works, 18 vol.—the first eight (1861–74) prepared for the press by Mazzini himself, the last eight (1877–89) by Aurelio Saffi, his brother triumvir at Rome. An English edition (6 vols. 1864–70; new ed. 1890–91) has been selected from the first eight vols. of the Scritti. See also Memoir by E. A. Vintari (2d ed. 1877); Marriott, Makers of Modern Italy (1889); and Clarke, Selected Essays of Mazzini (1887).

Mead, a fermented liquor made from honey. The honey is mixed with water and fermented. Cottagers sometimes use the honey which remains in the combs after the usual processes of dropping and squeezing, for making mead, which is a thin and very brisk, but at the same time insensuous beverage. Mead has been very popular in various ages, and was known equally to the polished nations of southern Europe and the barbarous tribes of more northern regions. The Latin name is Hydromel.

Mead, George Gordon, an American general, was born 31st December 1815, at Cariz, in Spain, where his father was a merchant and United States navy agent till 1816. He graduated at West Point in 1835, served for a time against the Seminoles and in the Mexican war, but was mostly employed on survey duty and in the construction of light-houses until the civil war, becoming captain of engineers in 1856, and major in 1862. In 1861 he obtained a brigade of volunteers, and during the peninsular campaign received a severe gunshot wound. He distinguished himself at Antietam and at Frederick'sburg, and was promoted major-general in November 1862. In June 1863 he was placed in command of the Army of the Potomac, superseding Hooker (q.v.) on the night of the 27th. A week later Gettysburg had been fought, and Lee's effort to carry the war into the country north of the Potomac had been defeated. Meade became brigadier-general in the regular army on 3d July, and major-general in 1864. After the war he commanded various military departments, until his death, which occurred at Philadelphia, 6th November 1872. There is an equestrian statue of him (1887) in Fairmount Park there.

Meadow Saffron, See Colchicum.

Meadows-Taylor. See Taylor (Philip M.).

Meadville, capital of Crawford county, Pennsylvania, on French Creek, 112 miles by rail N. of Pittsburg. It manufactures woolen, paper, glass, and iron Millinery. It has oil-refineries and large mail-shops, and is the seat of Alleghany College (Methodist, founded 1813), and of a Unitarian theological school. Pop. (1900) 10,291.

Meagher, Thomas Francis, Irish patriot, was born in Clonmel, 5th August 1823, son of a wealthy merchant who resided at Waterford more than forty years. He had his education at the Jesuit college of Clongowes Wood in Kildare, and at Stonyhurst, and early devoted himself to the patriotic cause as a prominent and fearless member of the Young Ireland party. The episode of the "Treason-folly" Act, but was sent for life to Van Diemen's Land instead. He made his escape in 1852, studied law in the United States, but on the outbreak of the war volunteered into the national army. In 1861 he organised the "Irish brigade" for the Federals, and distinguished himself by his courage in the seven days' battles around Richmond, at the second battle of Bull Run, Fredericksburg, and Antietam. After the war he became a pensioner of Congress, and taking measures as temporary governor to keep the hostile Indians in check, fell from the deck of a steamboat into the Missouri, near Fort Benton, and was drowned, 1st July 1867.

Meal. See Bread.

Meal-tub Plot, a conspiracy fabricated in 1679 by Thomas Dangerfield to gain credit as an informer and to gain a pension. A son of a Roundhead farmer, he was born about 1650 at Waltham in Essex, and he had first started with the baseless assertion that the Presbyterians were conspiring to destroy the government and set up a republic. When this was discovered to be a lie he was hung into Newgate, whereupon he rounded at once upon the Roman Catholics, declaring that the pretended Presbyterian plot was only a cover for their own design upon the king's life, and that the papers would be found concealed at the bottom of a meal-tub in the house of one Mrs Collier, who, together with Lady Powis, was actually tried and acquitted for the plot. Dangerfield himself was whipped and pilloried in June 1685, and on his way back from Tyburn was killed by a blow in the eye from the cane of a barrister, Robert Frances, who was executed for the murder.

Meal-worm, the larva of a small black beetle, Tenebrio molitor, allied to the common Blaps (q.v.). Both adults and larvae are too common about bakeries, granaries, and stores, for the eggs are laid in meal, flour, and similar food-stuffs, on which the emerging larvae feed voraciously. The adult resembles Blaps, and is about half an inch long; the larva is decidedly longer, thin and round, yellowish in colour. An American species, T. obsecucus, has also become common in Britain. The preventive is thorough cleanliness. The meal-worms are often used as food for cage birds.

Mealy Bug (Coccus adocißimus or Dactyplois longisignus; see Coccus), an insect naturalised in our hothouses, and very commonly found on such plants as Stephanotis and Camellia, orchids and pine-apples. The young appear like small reddish-brown moving specks on the leaves and small branches, the adult insects, which they later become, are recognised by the back. As they grow older they become darker in colour, and are covered over with a white powdery-looking substance. After fertilisation, which usually takes place in spring, the female, remaining in the position described, lays her eggs between her body and the surface of the plant, after which her body shrivels up until it forms a covering for the mass of eggs, rendered more effectual by the large amount of cottony material formed over it. The young can be seen developing in scores in a few days, and hatching out of the eggs in 18 days. The young when they afterwards free themselves, and run about on the plant. The Mealy Bug is disliked by gardeners chiefly on account of the amount of dirt that collects round it on the leaves and branches, and the injury it does to the flowers and fruit. Lightly syringing the leaves and stems with water and solutions with a little paraffin oil in addition is generally sufficient to check the ravages of this little pest, especially if put on before the larvae acquire their mealy coats. On valuable plants this may be painted with brush-dips. Tobacco smoke proves useful in early stages.

Mean, in Mathematics, is a term interpolated between two terms of a series, and consequently intermediate in magnitude. The Geometrical Mean (q.v.) of two numbers is always less than
In mild forms of the disease, nothing more is requisite than to keep the patient on a low diet, attend to the state of the skin, and expose to cold, which is best accomplished by keeping him in bed with the ordinary warmth to which he is accustomed in health. While the eyes are red and irritable, it is desirable that he should be shaded from the light. If the chest-symptoms become urgent, he must be treated according to their nature. Bronchitis (q.v.), sometimes extending into pneumonia (q.v.), is most to be feared. If the eruption disappear prematurely, it may sometimes be brought back by placing the patient in a warm bath. In the latter case, when it is then required, but must, of course, only be given by the advice of the physician. The patient must be carefully protected from exposure to cold for a week or two after the disease has apparently disappeared, as the lungs and mucous coat of the bowels are for some time very susceptible to inflammatory attacks. In some cases considerable delirium remains for a long time after the attack; and both the eyes and ears are very liable to injury from inflammations accompanying or succeeding it.

**Measles** is a name somewhat loosely used of a disease, or possibly several diseases, resembling measles, but for the most part less prolonged and severe. The cases grouped under this title, however, require further elucidation, as descriptions given by different authors differ very widely from each other.

**Measures.** See **Weights and Measures**.

**Meat.** For the dietetic value of meat, and the amount of meat imports, see **Food**. For extract of meat, see **Extracts**, and see also **Preserved Provisions**. The sale of unsound meat is prohibited under heavy penalties by the Public Health Act of 1875, which regulates the powers of medical officers and inspectors of nuisances to examine game, flesh, milk, &c., and to have such meat or other food, if unfit for human food, destroyed by order of a justice. See **Ptolemais**, **Py. Emilia**.

**Meath**, a maritime county of Leinster, Ireland, bounded on the east by the Irish Sea, for 10 miles, and the counties of Dublin and Louth; area, 906 sq. m., or 579,801 acres, of which 34,300 are waste, bog, &c., and 72,500 level and arable. The maximum breadth, east to west, 47 miles. Pop. (1841) 183,116; (1861) 110,373; (1891) 76,616, of whom 71,389 were Roman Catholics and 4727 Protestant Episcopalians. The soil is a rich loam, and extremely fertile; but close up by 67 per cent. of it is devoted to pastures, the extent under crops (chiefly oats and potatoes) being about one-fourth of the total. The surface is for the most part undulating, being the eastern part of the great limestone plain of Ireland. The chief rivers are the Boyne and Blackwater; the Royal Canal passes along the southern border of the county. The principal towns are Trim, Navan, and Kells. A little linen and coarse woollen is manufactured. Anciently, Meath, which included West Meath, Longford, and parts of the adjoining counties, formed one of the kingdoms into which Ireland was divided, the royal seat being Tara (q.v.), where ancient earthworks still remain. After the English invasion it was occupied by Strongbow, and was erected into a county palatine by Henry II., who conferred it on Hugh de Lacy. In the end of the reign of Henry VIII. it was separated into its present parts, of which Meath remains above along the Boyne and Blackwater. John's Castle at Trim is one of the most extensive monuments of English rule in Ireland. There are a round tower and sculptured crosses at Kells, and a round tower at Donoughmore. Monumental ruins survive at Beccive, Clonard, and
Pilgrims round the Kaaba. (From a private Photograph.)

Duleek. Meath returns two members to parliament.

Meaux, a town in the French department of Seine-et-Marne, on a height above the river Marne, 28 miles NE. of Paris. It is a bishop's see, and in its noble Gothic cathedral (12-16th century, but still unfinished) is the grave of Bossuet (q. v.), who was bishop for twenty-three years. There is a large trade with Paris in corn, flour, cream-cheeses, &c. Meaux was besieged by the serfs of La Jacquerie (1338), and captured from the League (1594). Pop. (1872) 11,202; (1886) 12,201; (1891) 12,704. See Carro, Histoire de Meaux (1863).

Mecca (also anciently called Beccos), the Makoraba of Ptolemy, is one of the oldest cities of Arabia and the capital of the Hejaz, and as a holy city and focus of pilgrimage it may be called the metropolis of Islam. It is situated in 21° 30' N. lat. and 40° 8' E. long., 245 miles S. of Medina and 63 E. of Jeddah, its port on the Red Sea, in a narrow barren valley, surrounded by bare hills penetrated by two passes, and so secluded from observation that it is not visible until closely approached. The barrenness of the soil compelled the inhabitants to go out on all sorts of expeditions, and the command of the principal caravan roads, both from north to south and from the coast to the highlands, gave the city unusual facilities for commerce, and thus from a very early period the city was a notable trading centre. But the chief cause of its prosperity was its reputation as a holy place, possessing sacred objects, which well repaid a pilgrimage; thought whether the original attraction was the Black Stone or fetish of the Kaaba, or the medicinal spring Zemzem, is a matter of dispute. The city itself is very ancient and mainly modern owing to the frequent devastations caused by the winter torrent, which flows from the hills around, is about 1500 paces long and 650 broad, and is divided into more than twenty chief quarters. Along and beyond it runs the celebrated sacred course, a broad road extending from Safa to Marwa, which is run over by all pilgrims, and also forms a frequented bazaar. The streets are broad and airy, but unpaved and filthy, and the houses, climbing the hills on either side, are of stone, and well built, sometimes three or four stories high, with flat roofs and overhanging latticework windows. The interiors are well kept, since the greater part of Mecca is devoted to the annual pilgrimage which is the main support of a multitude of beggars, guides, and the other attendants of a fashionable sanctuary. There are charitable lodging-rooms for the poorer pilgrims, and also public baths, and a hospital. Drainage there is none, though there is plenty of water. Provisions, meat, fruit, &c. are readily procured from neighbouring parts of Arabia. The population, which is notorious for its vice and corruption of every sort, is probably under 60,000; but these are annually reinforced by at least an equal number of pilgrims. The latter, however, are not numerous enough to satisfy the natives, who flee them without remorse, and are too idle to supplement their extortions by any industry more vigorous than the manufacture of sacred relics. The temple of Mecca, or the Great Mosque, stands in the broadest part of the valley, and consists of a large quadrangle, capable of holding 35,000 persons, surrounded by arcades or cloisters, with pillars of marble and granite, &c., and entered by nineteen gates surmounted by seven minarets. In the centre is the Kaaba (i.e. cube), which was the temple of Mecca ages before the time of Mohammed, and then attracted pagan pilgrims just as now it draws thousands of Moslems. It has been twice rebuilt in historical times, but the old form has been preserved. It is not quite square, nor properly orientated; and it measures about 18 paces by 14, and 33 or 40 feet high. When Mohammed converted the heathen shrine into a Mohammedan focus, the original notion of an idol temple with a miraculous fetish was abandoned, and the legend was invented that the Kaaba was built by Abraham on the occasion of the outcast

of Ishmael. The celebrated fetish, or Black Stone, is apparently a meteorite, about a span long, built into the south-east corner at the proper height for kissing. There is also a 'Southern Stone,' of only inferior sanctity. The pilgrim circumambulates the Kaaba seven times, kisses the Black and touches the Southern Stone, and also goes round the Hijr or semicircular enclosure containing the so-called graves of Hagar and Ishmael. The Kaaba has always been richly decorated, and has long been annually re-covered (leaving only apertures for the two stones) with handsome brocaded hangings presented by the Sultan of Turkey, and brought with much state, along with the traditional Mahmal or Holy Carpet, by the Egyptian Hajj (q.v.), or caravan of pilgrims. The other chief decorations are the silver-gilt door, seldom opened, the marble inlay and silver-gilt plating and silk hangings of the interior, which contains little of interest. Hard by, and also within the court, is the celebrated well of Zemzem, a deep shaft covered by a cupola; the tepid water of which may once have been mineral, and is still regarded as miraculous, although the largest item in its present
Mechanics consists of sewage matter. This important abstraction of pilot work was lost, but was re-discovered by Mohammed's grandfather. Another object of veneration is 'Abraham's Stand,' the stone of which, with the imprint of his foot, is concealed from view. Outside the Kâba are no sacred or antiquarian buildings of importance, though the black columns and hayguides as dwellings of persons famous in the early days of Islam. In the time before Mohammed Mecca was under the control of the Kossaites, and then of the Kureish, from whom the Prophet reconquered it in 622, five years after his Flight (q.v.) there. It long remained under the rule of the califs, who spent large sums in its adornment. In 930 it was sacked by the Karmathians, who carried off the Black Stone, and kept it for twenty-two years. Mecca afterwards fell under the influence of whatever dynasty—Fatimides. A valley off Mecca-happened to rule in Egypt; and thus finally it came into the possession of the Ottoman sultans, whose power, however, is nominal, whilst the real governor is the sherriff, or reputed head of the descendants of the Prophet, who has held the chief executive power since he died, and has the support of a large following of retainers. Burchardt, the first Christian to visit Mecca, has, owing to native fanaticism, found but few successors.

See Snorre Haggirje, Mecca, mit Bilder-Atlas (1841); L. Burton, North with a Camera (1850); Wüstenfeld, Chronik der St. Meck. (1857-59); Sir Richard Burton's Pilgrimage (1855; new ed. 1880); Burchardt's Travels in Arabia (1829).

Mechanics is the science which treats of the nature of forces and of their action on bodies, either directly or by means of machinery. See Force, Energy, Dynamics. The action of forces on bodies may be in the form of pressure or of impulse, and may or may not produce motion. When the forces are so balanced as to preserve the body affected by them in a state of equilibrium, their action is investigated in that branch of mechanics called Statics; when motion is produced, they are considered under the head of Kinetics (q.v.). See also the articles on Kinematics, Hydrostatics, Hydrodynamics, and Pneumatics.

The relations inquired between the moving power and the resistance, with a view of changing the direction of the force, or otherwise modifying it. Machines are of various degrees of complexity; but the simple parts, or elements of which they are all composed, are reducible to a very few. These elementary machines are called the Mechanical Powers, and are usually reckoned as six in number, three being primary—viz. the lever, inclined plane, and pulley; and three secondary, or derived from the others—viz. the wheel-and-axle (derived from the lever), the wedge, and the screw (both derived from the inclined plane). What is special to each machine will be found under its name.

Mechanics' Institutes are voluntary unchartered associations of mechanics or working-men for the purpose of providing themselves, at small expense, with instruction in elementary and technical branches of knowledge, by means of a library, reading-rooms, classes, and lectures. The management is wholly or in great part in the hands of a committee or committees elected by the members of the association. The earliest germ of the Mechanics Institute was a course for journeyman mechanics formed by Dr Birkbeck (q.v.) at London in 1791; but the first Mechanics' Institute, properly so called, was organised by the same philanthropist in London in 1824. The original aim of the first institutes was to teach mechanics the correct knowledge of the principles of their respective trades. Subsequently the basis was enlarged, and the teaching of the elements and principles of a general education aimed at. Out of these organisations have grown, through the introduction of means of recreation and temperate enjoyment, the Working-men's Social Clubs and Educational Institutes.

Mechanists. A congregation of Armenian Christians, who catered in common with the Church of Rome, when Clement XI. was pope, in 1712. They derive their name from Mechan (i.e. the Comforter) da Petri (1676-1749), who in 1701 founded at Constantinople a religious society for raising the intellectual and spiritual condition of his countrymen, and for the purpose of disseminating a knowledge of the old Armenian language and literature. Two years later, however, the sectarian jealousy of the Armenian patriarch in Constantinople led to their removal to the Moren, and thence, on the conquest of that portion of Greece by the Turks in 1715, on Vrind-grand-duchy granted them the island of San Lazzaro. Their most useful occupation is printing the classic writings of Armenian literature, as well as valuable translations of works by Epiphresys, Philo, Eusebius, and other writers, the originals being lost. At San Lazzaro they publish a large number of oriental works, and at Vienna (since 1810) an academy, with a printing-office, &c., to which non-Armenians are admitted. See Langlois, Le Covenir Arménien de Saint-Lazare de l'Enseignement (1863).

Mecklin. See Malines.

Mecklenburg, the common name of two grand-duchies of Germany, distinguished respectively as Mecklenburg-Schwerin and Mecklenburg-Strelitz, and situated between the Baltic on the south and the Grand-duchy of Pomerania on the north. Mecklenburg lies on the E. and Slesw-Kitz-Holstein and Liebeck on the W. The former is a compact territory, abutting on the Baltic for 65 miles, its area being 5107 sq. m. (much less than Yorkshire). Mecklenburg-Strelitz (1144 sq. m.) consists of two districts, one of which, the grand-duchy of Strelitz, lying SE. of Mecklenburg-Schwerin, and the principality of Ratzeburg, wedged in between Schwerin and Liebeck. The region indicated forms part of the great North German plain, but is crossed by a low ridge from the south-east to the north-west, the water-parting between numerous small rivers that drain to the Elbe and to the Baltic. Along the line of this ridge there are more than 500 lakes, some of fairly large size. Canals too connect many of the lakes and navigable rivers, especially towards the Elbe. Except for sandy tracts and turfy moors the soil is fertile; agriculture is the chief occupation. The merino sheep are the finest in Germany. There is some iron-founding, making of agricultural implements and tiles, manufacturing of beet-root sugar, distilling, brewing, and tanning. Wood is plenitude; the coast and some of the rivers furnish fish; the coast and some of the rivers. The chief ports are Wismar and Rostock (Warnemünde). The population of Schwerin was 578,342 in 1890, 1287 more than in 1880; of Strelitz (1890) 97,387, against 100,260 in 1880, its diminution being chiefly due to emigration. The capital of each grand-duchy bears the name of the same name as itself. Society in Mecklenburg is still organised on a feudal basis, and in the early part of the 19th century it was not so advanced as England in the 13th century; serfdom was abolished only in 1824. At the head of
each grand-duchy stands a grand-duke; but both grand-duchies are represented in one and the same national assembly, which meets every autumn at Sternberg and Malchin alternately. This body embodies the decisions of all the members of the two duchies, who represent the peasantry and agricultural labourers, and representatives of forty-eight towns. The principal city of Rostock, and the towns of Wismar and Neustrelitz, have each an independent administration. A permanent college of nine members, representing the social life of all the great country, meets every year at Rostock. The executive is in the hands of four ministers (external and home affairs, justice, and finances) in Schwerin, and one minister in Strelitz. No financial statements are ever published in either grand-duchy. In Schwerin, however, there are three separate budgets, one controlled by the grand-duke, one, very small, controlled by the estates, and one by both parties in common. For the representation in the imperial assemblies, see Germany, Vol. V. p. 179. Although the evils under which the two principal monarchs suffered forty years ago, of which Fritz Reuter, the great Platt-Deutsch writer, gives a painful description in his poem Kein Hüsung, have been greatly mitigated, still the fact that large numbers emigrate because they cannot find houses to live in, and the relatively high price paid in gold for the valuable restraints imposed upon marriage by the landowners, prove that they have not been altogether abolished yet. Fritz Reuter's great novel Stromtid (Eng. trans. My Old Farm Days, 1858-80) and other works give admirable pictures of the semi-serene social life of the duchy.

In the 6th century Slavic races settled in the district now called Mecklenburg, which had just been left vacant by the Vandals. From the 9th to the 12th century the German emperors and the Saxo-dukes attempted at different times to convert the inhabitants to Christianity. The country was only definitely incorporated in the German empire in 1170. It was divided over and over again, from 1220 onwards for more than five hundred years, amongst different branches of the descendants of the original Slavic princes. Of these dukedoms (dukes after 1749), the only one deserving special mention is Albert III., who, called to ascend the throne of Sweden in 1363, was kept a prisoner for many years by Margaret, queen of Denmark, Norway, and Sweden. The Thirty Years' War ruined the independent ducal life of the country, and during the covetous eyes upon the dukedoms, they were sold (1629) to him by the emperor, but were restored to their rightful rulers in 1635. The two lines of Mecklenburg-Schwerin and Mecklenburg-Strelitz date only from 1701; in 1735 they agreed that the line which survived longest should inherit the territories of the other, and when both became extinct Prussia should be heir. The title of grand-duke was assumed by both reigning dukes in 1815. The year 1848 brought disturbances and tumults in Mecklenburg; a representative assembly was called together, and other reforms initiated; but the action of 1850 and following years restored things to their original condition. The two states were again agitated by reform questions in 1871-78; but nothing came of the agitation.

Meconium (Gr. mēkoûn, 'a poppy'), the inquisitive organ of the gall, the liver and the gall-bladder, has in some species the colour and nature of pond scum in a state of decomposition; it is also present in the intestine of all vertebrates and certain crustaceans, in a nearly pure state, to the extent of about 4 per cent. in combination with the alkaloids (see Opiate). Meconium is also the name given to the matter first discharged from the bowels of a new-born infant.

Medal (the same word as metal, through a Low Latin medallia), a piece of metal in the form of a coin, not issued or circulated as money, but struck to preserve the portrait of some eminent person or to commemorate some special event. Large medals are termed medallions; and works rectangular in form are known as plaques or plaquettes according to their size. The study of medals, which forms a branch of the science of numismatics, is interesting in a historical and anti-

Of the German school, Albert Dürer was the most famous of the early exponents. In Holland a remarkable series of jettons or medallots were issued in the 16th and early part of the 17th centuries, which give a record of the important events of which that country was then the theatre. In the 16th century the most important medals of French origin were produced by Jacques Primavera and Germain Pilon, and in the succeeding century Briot and Dupré were the great medallic portrayers of contemporary personages and events. English medals begin only with Henry VIII., and from Edward VI. onwards there is an unbroken succession of coronation medals. The earlier medals are cast in a very inferior manner, and are certainly not the work of native artists; indeed, it is not till 18, 1815, and above, 'Wellington.' The Peninsula- medall, for military services between 1793 and 1814, was issued only by the Queen in 1847, and conferred upon every surviving officer and private present at any battle or siege during those years. It carries no fewer than twenty-eight clasps for as many separate sieges, and also a clasp of which is Egypt, 1801. Long-service and good conduct medals of silver were instituted in 1830 and 1831, and rules then formed for their distribution among meritorious soldiers, sailors, and marines. On the edge of each of these medals is engraved the name, rank, and date of its recipient. The Victoria Cross (q.v.) was instituted in 1856. Similar medals for military and naval services are issued by foreign powers.

See A. Heissa, Les Médailles de la Renaissance (vol. viii. 1890); Gruber's Guide to the English Medals in King's Library, British Museum (1881); Cochrane's Catalogue of the Medals of Scotland (1884); Loudon's Medallistic History of the United States (2 vols. 1878); D. Harting's Irish War Medals and Decorations (1890); T. Carter's British War Medals (2nd ed. 1890); and a two-page illustration of medals of the preceding fifty years in the Graphic for 14th June 1890.

Medač, in Greek legend, a famous sorcerress, the daughter of Aietes, King of Colchis, and of the Oceanid Idyia, or of Hebe. When Jason, the leader of the Argonauts, came to Colchis in search of the Golden Fleece, she fell in love with the young hero, helped him to obtain the Fleece, and fled with him. She prevented her father from pursing by killing her brother Aiasyrs and strewing the scene with his blood; She avenged her husband upon the aged Pelas by persuading his daughters to cut him in pieces and boil him in order to make him young again. Being deserted by Jason for Glauce or Crenusa, daughter of Creon, King of Corinth, she revenged her wrongs by sending to her rival a poisoned robe or diadem which destroyed both her and her father. Medea then slew the children she had borne to Jason, and fled to Athens in a chariot drawn by dragons, which she obtained from Helius. There she was received by Aegeus, to whom she bore Medon; but, afterwards being compelled to flee from Athens, she took Medon to Aria, the inhabitants of which were thereafter called Medes. She finally became immortal, and the spouse of Achilles in the Elysian Fields. The story of Medea was the subject of a great many trageliums, but only the masterpiece of Euripides has come down to us. It was treated by Corinelle and Grillparzer, and gave Cherubini the theme for an opera.

Medellín, (1) a town (pop. 12,500) of Spain, on the Guadalii, 66 miles by rail E. of Badajoz. It is worth mention as the birthplace of Coles. (2) The second city of Colombia, capital of the department of Antioquia, lies in a lovely mountain-valley, 4300 feet above the sea, and 150 miles NW. of Bogotá. It is a handsome town, and possesses a cathedral, college, seminary, technical school, four printing establishments, factories for porcelain, pottery, porcelain ware, and jewellery. It has a considerable trade, exporting gold and silver. Pop. 40,000.

---

Fig. 1. Fig. 2.
Media, in ancient times, the name of the northwestern part of Iran or Persia, was bounded by the Caspian Sea and Parthia on the E., and by Assyria and Armenia on the W. It corresponded approximately to the modern Persian provinces of Azerbaijan, Gilan, and the east part of Kurdistan.

The Medes were an Aryan people like the Persians; their state religion was Zoroastrianism, and the Magi (q.v.) its priests. They were at first a bold and warlike race, very skilful with the bow, and noted horsemen. The Medes, accompanied by Chosroes and Idris Ali, in part, the subject to the king of Assyria, began towards 700 B.C. to be cemented together under a chief named Deocrates (Dajaukkin), who chose as his capital Ecbatana (q.v.), identified with the modern Hamadan. Their power grew stronger under his son Phraortes, who subdued the Persians, but perished in war with the Assyrians. Cyaxares, the son of Phraortes, renewed the war against Assyria, but it was interrupted by an invasion of Medes by the Scythians. Having treacherously murdered their chiefs, he expelled the war-worns. Then, in alliance with Nabopolassar, king of Babylon, he overthrew the Assyrian empire by capturing Nineveh about 609 B.C. Having annexed the northern provinces of the Assyrian empire, he began a war against Lydia; but the eclipse of 585 May showed his weakness. Noted for his just, and in time, terrified both parties into peace. Cyaxares was succeeded by his son Astyages. Against him the Persians, under their prince Cyrus, revolted about 550 B.C., and, being joined by a portion of the Median army under a chief named Harpagus, they took Ecbatana and deposed the Median king. From this time the two nations are spoken of as one people. Ecbatana became the summer residence of the Median kings. After the death of Alexander the Great (324 B.C.), the north-western provinces of the Median kingdom, including Media, fell to the Parthian empire. Although he was named the first king of Media, Artavasdes, against whom and his ally, Phraortes IV. of the Parthian, Mark Antony engaged in a disastrous campaign. Under the Sassanid dynasty the whole of Media was united to Persia (q.v.).

See G. Rawlinson, Five Great Monarchies of the Ancient Eastern World (3 vols. 1879); Ducker, History of Antiquity (6 vols.; Eng. trans. 1877-83); Lenormant, Sur la Monarchie des Medes (1871); Oppert, La Peuple et la Langue des Medes (1879); A. von Gutschmid, Neue Beiträge zur Geschichte des alten Orientes (1876); and the popular Media, Babylon, and Persia, by Miss Ragozin (1889; 'Stories of the Nation' series).

Mediation. See Germany, Vol. V. p. 177.

Medical Jurisprudence, also called Forensic Medicine, is the branch of medicine which brings medical science to bear on legal questions, in determining criminal and civil responsibility. It has regard mainly to civil rights or to injuries to the person. Among subjects in its province are those connected with birth, pregnancy, murder, natural death, rape, insanity, monstrosity, accidental or intentional injuries, the action of drugs, &c., all of which are dealt with in their several branches. The subject may be found in the articles on blood-stains and poisoning. Good general handbooks are Dr Taylor's Manual and Principles and Practice, and Dr C. M. Tilyard's Legal Medicine (2 vols. 1882-83).

Medical Staff Corps. See Army, I. 438.

Medici, a distinguished Florentine family which attained to sovereign power in the 15th century, owed its earliest distinction to the success with which its members pursued various branches of commerce, and the liberality which they showed in devoting their wealth to the public good. Their well-known arms, representing six balls (from which comes the name of the Medici family), but without reason believed to represent pills, as their name to show that they had been originally apothecaries. In 1465 Louis XI. of France honoured the Medici by conferring on them the right to wear the French deur-de-lis on one of the balls. From that period the Medici family, as a powerful part in the government of their native republic, and from the period (1378) when Salvestro de' Medici was elected gonfaloniere the family rose rapidly in greatness. It was, however, Giovanni (born 1360) who passed the framework, one, and by his generosity and affability gained the position of influence hitherto unparalleled in the republic, to which his sons Cosimo and Lorenzo succeeded. With Cosimo (1389-1464), surmamed Il Vecchio ('the Ancient') and 'Pater Patriae,' began the glorious epoch of the Medici while from his brother Lorenzo was descended the collateral branch of the Medici which in the 16th century obtained absolute rule over Tuscany.

Cosimo's life, except during the brief period when the Albizzi and other rival families succeeded in wresting from him control of the Florentine government and exiling him from Florence, was one uninterrupted course of prosperity. He was successful in his political alliances, and procured for Florence security abroad and peace from civil dissensions within her walls. He employed his great wealth in engraving art and literature.

He made Florence the most brilliant centre of the revival of classic learning which distinguishes the 16th century, he enriched her with splendid buildings, and gave unrivalled treasures to the great libraries which the people could afford. Although his all-powerful influence was not explicitly recognised in the state, and the form of government remained republican, Cosimo in reality was entirely master of the town, and filled the public offices with his partisans. He was succeeded by his son Pietro I., who was succeeded by his grandson Giovanni (or Giampietro), and in character was assisted in the government by the preeminent talents of his son Lorenzo (1448-92), afterwards famous in history as Lorenzo il Magnifico.

On his father's death (1469) Lorenzo and his brother Giuliano were recognised as 'principi dello stato.' The growing power of the Medici had roused much envy amongst other great Florentine families; and in 1478 these malcontents, headed by the Pazzi and in league with the pope, Sixtus IV. (Della Rovere), who saw in the Medici a powerful obstacle to his schemes of temporal aggrandizement, formed a plot to overthrow their power, known as the conspiracy of the Pazzi. Only Giuliano was victim of the assassins who were to have killed both brothers during service in the cathedral; the popularity of Lorenzo was increased by the courage and judgment shown by him in this crisis. Lorenzo was a worthy descendent of his famous grandfather, just in his government, magnanimous to his enemies, and not only a munificent patron of art and literature, but himself a man of letters, and a lover and patron of the arts.

To enlarge on the institutions, universities, and schools founded by him, and on the famous names of painters, sculptors, architects, philosophers, and poets who surrounded him would be to write the history of our days; all that can be said is that the Medici among the most zealous promoters of the art of printing, and established under Cennini a printing-press in Florence. Although he used his power in the state well, yet he sapped the existing forms
of government; and, in seeking only the advancement of his family to more absolute power, he left Florence at his death weakened and ready to be the prey of her enemies during the troublous times which began with the 16th century.

Lorenzo left three sons, Pietro, Giuliano, and Giovanni. His eldest son, Pietro II. (born 1471), was the most wicked and showed himself treacherous alike to friend and foe. He allied himself with the king of Naples against Lodovico Sforza of Milan, and the latter in 1492 called to his aid Charles VIII. of France and his army (see ITALY). Pietro, terrified at the advance of the powerful enemy and terrified for the safety of the Medici troops on their entrance into the Florentine dominions, and surrendered to them Pisa and Leghorn. The magistrates and people, incensed at his cowardice and treachery, drove him from Florence and declared the Medici traitors and rebels, and deposed them from participation in the government. Pietro was drowned (1503) in the Garigliano, near Gaeta, having joined the French army in their attempted conquest of the kingdom of Naples. All efforts of the Medici to regain their power in Florence were vain until in 1512 the pope, Julius II., consented to send an army to invade the city. Near Florence, was taken and sacked, and the Florentines, helpless and terrified, drove out their gonfalone, Piero Soderini, and recalled the Medici, headed by Giuliano II. (born 1475). In 1513 the election of the Medici pope, Leo X. (q.v.) completed the restoration of the family to all their former splendour and reduced Florence to a papal dependency. Giuliano II. at the pope's desire surrendered the government to Lorenzo II., son of his elder brother Pietro I., and Giuliano II. and Duke of Urbino married in 1516 with a marriage of a relative of Francis I. of France, died in 1516. The young Lorenzo II., born 1492, and the last legitimate male descendant of Cosimo 'Pater Patriae,' on whom the pope had also conferred the duky of Urbino, was feeble, arrogant, and licentious. He died in 1519, leaving only one legitimate child, a daughter, Catharine (q.v.), afterwards wife of Henry II. of France, who played a conspicuous rôle as regent during her son's minority. An illegitimate son, Alexander, born 1510, was afterwards declared to be the pope's son.

The power now passed into the hands of the Cardinal Giulio de' Medici, a natural son of the elder Giuliano, assassinated in the conspiracy of the Pazzi; and Giulio was created pope in 1523 under the name of Clement VII. During the invasion of Italy by Emperor Charles V. in 1527, and the consequent weakening of the papal power, Florence rebelled against the regents imposed on her by the pope, and expelled them along with the young Prince Alexander. The pope and emperor, however, soon made peace, and their united forces were directed against Florence, which, during the famous siege lasting ten months, made her last desperate and unsuccessful stand for liberty. After the surrender of the town, August 1530, Alexander de' Medici was proclaimed hereditary Duke of Florence. He was swarm of unqualified implements of tyranny. He was assassinated in 1537 by his cousin Lorenzo, a descendant of the collateral branch which had its origin in Lorenzo, brother of Cosimo 'Pater Patriae.' To this younger branch belonged also the next ruler of Florence, Cosimo I. (born 1519). He was son of the famous captain of free-lances, Giovanni delle Bande Nere ('of the Black Bands').

Cosimo, sometimes called the Great, possessed the astuteness of character, the love of art and literature, but not the frank and generous spirit of his greater predecessors. He was cruel and relentless in his eminencies, but a just ruler. He extended his territories, and in 1530 was created Grand-Duke of Tuscany, and crowned as such by Pope Pius V. He died in 1569, and was succeeded by his son Francesco I. (born 1541). This duke possessed few of his father's abilities and many of his faults. He became a tool in the hands of his mistress, the unscrupulous Bianca Cappello, whom he married, and his reign marks the beginning of the decay of the political power of Florence. The death of Francesco and Bianca (October 1567) raised suspicions that they had been poisoned by the duke's brother and heir, the Cardinal Ferdinando. Maria, daughter of Francesco I., became the second wife of Henry IV., of France. Ferdinando II. were popular, and contributed to the prosperity of their country. But at the beginning of the 17th century the race rapidly degenerated; and, after several of its representatives had suffered themselves to become mere puppets in the hands of Austria or Spain, the family became extinct in the death of its last male representative, Gian Gastone, the seventh grand duke. His only sister, the Electress Palatine, the last of all the Medici, expired in 1743.

9th centuries A.D. Just as difficult is the question whether the Indian medicine is an aboriginal product or an importation. But its earliest position was an exalted one, and its young votaries were drawn from the higher castes. Their curriculum lasted from the twelfth to the eighteenth year; decorum, piety, benevolence, unselfishness were interwoven with the study of medicine, and as the threshold of practice they took an oath signifying the resemblance of the Hippocratic. Dietetics and bodily cleanliness play an important part in Indian medicine. From the vegetable, mineral, and animal kingdoms it drew its most invaluable, containing many antidotes to poisoning, snake-bite especially.

The old Persian medicine, as revealed in Zoroaster's Zend-Avesta, stood in the closest connection with religion. But Greece made her medical superiority felt in Persia, as in Egypt and India, and in later times the schools founded by the Nestorians were important centres whence Greek medicine was diffused throughout the East.

Chinese medicine meets us historically only in the 5th century B.C. Elaborate rules for noting the pulse and a portentous array of vegetable, mineral and animal remedies are its chief characteristics. Old Japanese medicine was borrowed from it.

Greece is the mother-land of rational medicine. Already in Homer we find practitioners ranking with musicians and architects, and visiting patients for professional fees. As a distinct form of surgery, is not in the Homeric foretime subordinate to religion as in the East. It has its tutelary deities—Apollo, Artemis, and Pallas, and its tutelary demigods—Esclapius and his daughter Hygieia—but these were above and outside the medical art, while the sick who repaired to their temples were healed, not by treatment, but by such religious exercises as the 'temple-sleep,' in which they dreamt the dreams from which the priests divined their malady and prescribed the appropriate sacrifice. The service of Esclapius had nothing to do with medicine or its practitioners, and was in the time of Hippocrates resorted to only by the superstitious among the lower orders.

Early in the Greek mainland and islands medicine had rounded itself off as a distinct science with a professional character. As a profession it became open to every free-born citizen, and included two classes—the qualified and the amateur. Its votaries began in boyhood with the study of remedial plants, the preparation of unguents, draughts, and plasters, and priests became a common profession, and surgery, and finally treatment at the bedside. Duly qualified, the physician took the celebrated 'oath'—and thereafter received patients in a house of his own (intenios), or visited them under their own roofs or went on circuit. The fee included the cost of prescriptions when made up—the humble practitioners receiving it in advance; but many towns kept a physician for the public service; and in some cases physicians of eminence became attached to foreign courts. Such was the position of the medical profession when Hippocrates (409 B.C.) gathered round him his medical disciples, and formulated the doctrine and practice, and not only augmented it, but gave it a character and direction of his own.

He strikes the keynote of his school in denying to diagnose a supernatural origin. 'From God comes only the elements and the body,' he said; 'and these are except in conformity with nature.' In medicine proper his method was threefold: to ascertain the past, to examine the present, and to forecast the future of the patient. After carefully noting the previous history, generally from the patient's own sources, he took a thorough examination of the symptoms as the basis of a diagnosis. This review, performed preferably in the morning when the physician's faculties and senses were at their best, included the general nutrition, the bodily, particularly the facial, complexion, the temperature, the respiration, and the state of the digestion and genito-urinary systems. The pulse received quite secondary consideration. The Hippocratic diagnosis was seen to special advantage in thoracic and abdominal diseases. Perfusion was not neglected; and suspicion (i.e. shaking the patient to induce internal movements which were carefully listened to) was also among the aids to diagnosis. Prognosis, the third and last step in dealing with a patient, was likewise in the hands of the physician, who knew the patient, and grew naturally out of the peculiarly Hippocratic doctrine of 'critical days.' Among the favourable signs were tranquil sleep, the setting in of perspiration, ease of bodily movement; while of contrary import were the fictio Hippocratica (still the classic description of approaching dissolution), sinister revelations of the eye, the breath, the sputum, and the abdomen, with those of the excretions, particularly the urine. Dietetics hold the first place in the Hippocratic treatment. In acute cases the sustenance was the barley-pisbane, the drinks water mixed with wine. External agents were oil, water, bay-salt in acid solution, wine, and acidulated lotions; in chronic cases diet and gymnastics, with vocal exercise in singing and declamation, sometimes the artificial art of enemas. The doctrine of the Hippocrates was 'the more the remedy the more the patient was appeased.' Venesection was sparingly employed—capping more frequently. Drugs of indigenous and Egyptian, even of Indian origin, mostly in solution, were used with discrimination. See also SURGERY.

For at least a century after Hippocrates medicine advanced but little. His Greek successors, healed Praxagoras, and Chrysippus, supplemented him by theorising and in a less degree by independent observation, and were for the former characteristic called Dogmatists by Galen.

The break-up of the Macedonian empire into kingdoms gave rise to so many noy of medical culture. The Alexandrian school, purely Greek in personal and character, was represented by Herophilus and Erasistratus, both of them great anatomists. The former took account of the immediate cause of disease, and its effects, both as the patient and anatomical changes, while in treatment he relied mainly on drugs and venesection. The latter, much less loyal to the Hippocratic name, found in excess of nutrition with its results, dyspepsia and plethor, the chief causes of inflammation and fever. Herophilus and Erasistratus each headed a school, both called Dogmatic from their tendency to supersede their sound anatomical traditions by premature generalisation. Out of the conflict of Herophilite and Erasistratian sprang the Empirics, whose professional 'tripod' was clinical observation, previous history of the patient (anamnèsis), and 'transition from like to like' (analogical inference).

Rational medicine entered Rome with the Greek wave (that followed the expulsion of the Hellen from Alexandria and the subjection of the Hellenic world, and received a great impetus from the dictator Julius Caesar, who extended the Roman citizenship to all in the city who profess the healing art. Among these were Asclepiades of Bithynia, recommended to the Romans by his patient, the handsome young Nero, and whose gymnastics already in favour with them. Regarding the human body as composed of countless atoms divided from each other by invisible interspaces ( pores), he made health consist in the normal behaviour of these atoms, and maintained their proper calibre, and illness in their derangement, whereby the pores were widened or narrowed. He enjoined observance of the Stole
maxim, to live conformably to nature, body exercises, including the manipulations of the bath attendant (‘massage’), and diuretics being his chief remedies. His immediate follower, Theon, simplified his etiology, and, ignoring the atoms, insisted on the abnormal condition of the pores as the one cause of disease, finding health in the methodus or ‘middle passage’ (as Hiusen called it). The etiology of health in their constriction or relaxation, or in the partial co-existence of both conditions. His therapies aimed at inducing a state opposite to that in which the patient was found, and so relaxation was treated with astringents, constipating, purgatives, and diuretics with laxatives. With the theory of ignoring mere authority, even the Hippocratic ‘humoralism’ still dominant, and studied the patient’s general condition as the safest ground of diagnosis. Despising etiology, even in local affections, their therapies became an unreflecting routine. But their skill in dietetics amply explains their acceptance with the Roman world, ensuring the patient fresh air, and a pure and healthy skin, while rejecting all drastic or lowering medicines.

Cornelius Celsus, an adherent of no school and perhaps not a professional man at all, is yet the highest name in the Roman healing art, for his treatise De Medecina, which formed part of his encyclopaedia—a sort of ‘Whole Duty of the Roman Patient.’ Himself one of the order, he has drawn up rules, and made the whole of his Hippocratic materia medica, or infirmaries for slaves attached to every country-seat or urban palace. His experience of such hospitals enabled him to test the practice of the profession, and from the knowledge thus acquired, especially in dietetics, physiology, and the scientific investigation of the causes of disease, he drew his elegant written book. Historically its value is priceless, as the source from which we have distinct knowledge of the Alexandrian period. He bases medicine, with Hippocrates, on anatomy, physiology, and the scientific investigation of the causes of disease, while, without excluding the hypothetical, he allows no hypothesis to influence practice. The whole work forms a compendium which, since its re-emerging to light in the 16th century, has held the first place in Latin medical literature. In the next generation, Pliny the Younger. Especially notices for its valuable, then incidental, allusions to medical authors. But to return to the Methodics. In the reign of Nero, Thessalus of Tralles was their most popular representative; half a century later Soranus of Ephesus took his place in Rome as the most distinguished of the school. His masterwork, written in Greek, is on dietetics, while in medicine proper his treatise on acute and chronic diseases (lost in its Greek original, but preserved to us in the African Latinity of Celsus Aurelius, who lived about the end of the 4th or beginning of the 5th century) exhibits the Methodic practices in its most favourable light. This, though with diminishing strength, resisted even the influence of Galen, till in the middle ages it took a fresh start.

An offspring from the Methodic school had already appeared in the 1st century—viz. the Pneumatics, which sought to reconcile it with the Hippocratic humoralism. Its originator, Athenaeus, derived its central doctrine from a hypothetic pneuma or soul pervading the universe; but in practice he combined the empiric and methodic therapeutics. About the same time, the Neopythagoreans, whose chief representative was Rufus of Ephesus and the much abler Arastus of Cappadocia, who, for general culture, moral worth, and professional skill, to say nothing of the purity of his Ionic Greek, comes next to Hippocrates.

We have now reached the epoch-making Galen, born at Pergamum in 129 B.C. He studied medicine in the Hellenistic schools of the Levant, came as a qualified practitioner to Rome in 164. His rapid success aroused the jealousy of the profession there, and he again travelled in the East, to be recalled to Rome by the emperors Lucius Verus and Marcus Aurelius. He found medicine reduced to a Habel of tongues while claiming to be a science, and posing as a profession. He sought to rehabilitate it by restoring to anatomy and physiology the value withheld from them by Empirics and Methodics, and by reinforcing practice with the knowledge of the Alexandrian school; in other words, to make diagnosis scientific by basing it on anatomy and physiology, and to reconstruct therapeutics by an unprejudiced clinical experience. His guide was Hippocrates—the treatise on Prognostics in particular; but unhappily he abandoned the sound Hippocratic method, and tried to unite professional to scientific medicine with a philosophic link. This he found in a hyper-idealistic Platonism, from which he evolved a teleological system which provided every question with an answer and every riddle with a solution. Hence arose a peculiar appearance in the medical system, the vivifying principle, the pneuma, reaches in man its highest development as the ‘psychical,’ the ‘vital,’ and the ‘natural’ spirit, and manifests itself in ‘spiritual,’ ‘pulsating,’ and ‘natural’ force. The processes regulating nutrition and structure he explained by the attraction of the ‘whole substance’ and the expulsive powers. Recognising, however, that these do not cover all physiological processes, he added to them the occult powers of the ‘whole substance,’ the ‘specific qualities’ of his later followers; thus opening the sluice-gates to every kind of superstition.

Disease he ascribed, first, to immediate causes (such as plethora and corruption of the juices); next, to the disturbance thence arising; next, to the abnormal structural processes started by such disturbance. Finally, to the degeneration, which, while the vivifying principle, the pneuma, reaches in man its highest development as the ‘psychical,’ the ‘vital,’ and the ‘natural’ spirit, and manifests itself in ‘spiritual,’ ‘pulsating,’ and ‘natural’ force. on 'health and the means of maintaining it,' which afterwards attracted attention only through its name. The Salernitan school had many students, and, proportionately, a considerable staff of teachers, some of whom were women, their wives and daughters; the best known of them is Trotula (11th century), wife of Joannes Platerius, first of a medical family bearing the same name, who made a manual of medicine which long held its ground. But none of the Salernitan writers are other than compilers, chiefly from Hippocrates, Galen, and their successors. Diet was their sheet-anchor, though their pharmacopoeia was highly Scarce; and, as the clinical teaching was also favourable to rational medicine. But the Arabian wave swept over the school, and, after the 13th century, almost obliterated it. It survived, however, though but the shadow of a name, till its suppression in 1811 by Napoleon.

Latin renderings of the Arabian compilers were the main channel through which Europe recovered its knowledge of the classical medical writers, Constantine Africanus (1050) being the earliest of these translators. Transmitted through the Arabians, the Greek works were also revised, and so, under such guise it found its way to Montpellier, a school which developed as that of Salerno waned. Bologna and Padua, too, derived their medical teaching from this oriental travesty of the Greek; but no great independent authority arose in any of these seats of learning, and Hacer points out that the practical tenor of the treatises they put forth—notably the Montpellier school—was due to British authors, who, like Gilbert the Englishman, and Gordon the Scot, had graduated there. But the fall of Constantinople and the immigration of Greek scholars into Europe reopened the fountains of ancient learning. Hippocrates and Galen now became known in the original, and the masterwork of Celsius, till then a forgotten book, was once more read with profit. Rational medicine had returned to its parents.

To the writings of Galen was due the revived study of anatomy, and with it physiology; to Dioscorides the resuscitation of medical botany. The discovery of America, followed up by inland exploration, led to the introduction of new medicines, vegetable and mineral. The 16th century saw the consummation of the work of the Arabian masters was completed by 'authorised versions' of the Greek originals—versions chiefly the work of physicians who were also Hellenists, and by the middle of the 16th century Galen was reeulized in convenient form. The flowering of Arabian medicine was of earlier date in Italy and England than in France, while Germany was under the temporary sway of Paracelsus, a meteoric genius who followed no school, but vitiated his independence of judgment and great freshness by the haughtiness of arrogance. He professed a positive as well as a mystical side, and, while regarding disease as 'spiritual,' with which, unassisted, nature herself could often cope, he also relied on chemical agencies for its cure. These owed their virtue to their secret power over disease, whatever its name and nature. Opium, in the form of tincture, and antimony were among these. Beyond compelling a closer study of chemistry and showing an example of independence amid the universal belief in Galen, Paracelsus did no good to medicine, and the result, outside Germany, was held in little account.

Meanwhile, the outbreak of disease on an epidemic scale, in forms unknown to the Greeks, threw the medical art on its own resources, and started that revolt against authority to which it owes its next advance. The sweating sickness was minutely described by Kaye (Latinised, Caius) in England, and syphilis by physicians on the
text-book, but now, like his Aphorisms, superseded by the juster knowledge of which he was the pioneer. Among his pupils was Van Swieten, the founder of the Vienna school, while contemporaries with him were Hoffman and Stahl, both of them professors at Halle, in advance of their time as chemists, and enthusiastic systematizers, the former eager to reconcile the 'spiritual' with the 'materialistic' view of nature, the latter bent on eliminating whatever was supernatural and making the 'psychical' the essence of his being.

Physiology and rational medicine made a new start under the all-accomplished Swiss Von Haller, whose teaching prevailed for good in spite of recurrent outbreaks of the systematizing tendency. Muscular irritability, the rejection of the hypothetico-ename, and as distinguished from nervous sensibility, was a discovery of his which threw fresh light on living movements, while medicine proper owes to him a series of experiments, better appreciated by later science, on the influence of drugs on the healthy subject. Morgagni of Bologna laid practicemedicine under yet more lasting obligations by his elaborate work in morbid anatomy, of which he may almost be regarded as the creator. His Leçons du Cabinet pour l'Instruction Médicale was another development in the theorizing direction, its most prominent names being the Neapolitan Borelli, the Roman Baglivi, and the Scottish Pictarine. Physiology is more indebted to these quasi-scientific systematizers than to therapeutics, which, however, is under distinct obligations to another school, the later-chemical, whose Dutch founder, Sylvius, applied to treatment the results of the improved biology and chemistry. He had many followers in Germany as well as Holland; but his ablest pupil was the English Whitehead, who worked permanent good in the examination of secretions, to say nothing of his still classic account of diabetes and of nervous maladies. Reaction against the theorizing tendency was led by Sydenham, whose guide in practice was Hippocrates, with his 'natural history of diseases.' Nature he held to have a self-restoring power, which it was the physician's duty to watch and assist. As a practitioner Sydenham was especially great, while his descriptions of disease—great, for example—are those of an artist in medicine. But it was in the art of the teacher and expositor of his facts and utilizer of facts that his influence was soundest. Coming as it did after the anatomical, physiological, and chemical work of the previous generation, it gave practical direction to so much of it as had stood the clinical test.

Theory, however, is too attractive for ingenious minds to be long idle, and again we find medicine turning into 'the high priori road.' The later-chemical school underwent something like a revival, thanks to the brilliant astronomy of Newton and the medical discoveries of the English Cheyne. Sydenham's example, however, was still powerful enough to curb the theorizing tendency, so that enthusiastic mathematicians like Mend did not allow their love of hypothetico-symmetry to vitiate their practice. The next great name in medicine with its 'natural history of diseases,' of Hippocrates and Sydenham, familiar with all that was valuable in other schools, but strenuous in his pursuit of anatomical and physiological fact, in which he worked assiduously with the microscope.

As a clinical lecturer he was the forerunner of the modern teaching hospital. His hermitage and hiscliene was resorted to by aspiring students of every country. The love of system which he shared with so many of the master-minds of medicine is seen in his Institutiones, long a
Medicine

Medina (Medicago), a genus of plants of the natural order Leguminosae, sub-order Papilionaceae, nearly allied to Clover (q.v.), but distinguished from that plant by its annual, and to a great extent, its perennial habit, and the flowers are produced in the leafy shoots of the plant, or, in most species, spirally-twisted legume. The species, which are very numerous, are mostly annual and perennial herbaceous plants, with leaves of three leaflets like those of clover, and are natives of temperate and warm climates. A number of them are found in Britain, and many more in the south of Europe. They generally afford good green food for cattle, and some of them are cultivated like the clovers for this use, amongst which the most important is the Purple Medick, or Lucerne (q.v., M. sativa). Besides this, the Black Medick, Norman or Lupline (M. lupulina), is one of the most generally cultivated. It is a common native of Britain, where it is very generally sown mixed with Red Clover and Ryegrass, and is useful where a close turf is desired.

Medina, El. (Arabic for 'The City'), or rather Medinat en-Nabi ('City of the Prophet'), or Medinat Rasuli-elah ('City of the Apostle of God'), because it was there that Mohammed took refuge after his Hegira or Flight from Mecca in 622, and there that he lived till his death. Formerly called Yathrib, and mentioned by Pedocles in his history of the Mohammedan world after Mecca, and the second capital of the Hedjaz in western Arabia, it is situated about 270 miles N. of Mecca, and 132 N. by E. of the port of Yanbon on the Red Sea, and contains about 16,000 inhabitants (Burton), chiefly engaged in agriculture. It consists of three principal parts—a town, a fort, and suburbs of about the same extent as the town itself, from which they are separated by a wide space (the Munakhan). It is about half the size of Mecca, and forms an important point on the regular route from Mecca to Egypt. The houses are flat-roofed and double-storied, and are built of stone, brick, and palm-wood. The principal building is the Prophet's Mosque El-Haram ('the Sacred'), supposed to be erected on the spot where Mohammed died, and to enclose his tomb. It is of smaller dimensions than that of Mecca, and is 134 feet long and 110 feet wide. It is divided into four great rooms, 420 feet long and 340 feet broad, with a spacious central area, surrounded by a peristyle with numerous rows of pillars. The present building is, however, only the last of many reconstructions, of which the best was that of Kaim Bey, the Mameluke sultan, in 1481, whose dome and pulpit still stand. The Mausoleum, or Ihnirah, is an irregular doorless chamber, 50 to 55 feet in extent, situated in the south-east corner of the building. It is surmounted by a large gilt crescent above the door, and a green dome over the rest of the building. The walls are flat-worn out, or when a new sultan ascends the throne, cover a square edifice of black marble, in the midst of which is Mohammed's tomb. Its exact place is indicated by a long pearly rosary—still seen in 1855—thrown across the image of the body, and believed to lie undecayed at full length on the right side, with the right palm supporting the right cheek, the face directed towards Mecca. Close behind him is placed, in the same position, Almukrit and behind him Omar; and Fatimeh's house

years, now came to the front with Bichat and Broussais—the former a great anatomist and physiologist, the latter distinguished in pathology. Pathological anatomy had an extraordinary recent, and diagnosis was made still more precise by Corvisart and Pierry in perfecting the ‘perception’ of Auenbrugger. By Laennec's advance upon this—assentiation to wit—the movements of the lungs and heart are heard through the thin skin. In addition to these, they are divided into smaller units by thin 'medicate septa,' morbid anatomy connected the lesions of the intra-thoracic viscera with the sounds so transmitted—a twin-source of medical knowledge, rich in results on diagnosis and treatment. Bayle, Chomel, Louis, Cruveilhier, and Andral, each in his own way, did memorable work in scientific and practical medicine, founding the great clinical school which, continued under Bretonneau, Rostan, D'Aubert, Rayer, and Trouseau, made Paris the resort of aspiring young physicians from both hemispheres. In Great Britain medical education was steadily improved by sounder chemical and physical, as well as anatomical and physiological knowledge, while the preference of rational observation to theory was admirably illustrated by Willan on the skin, Bright on the kidneys, and French on the stomach. The Paris school found apt pupils in the British Islands—the Scottish Forbes and the Irish Stokes, with the English Hope, Latham, and Watson, doing much to diffuse a sounder diagnosis and treatment of chest diseases; while in particular, maintained the traditional celebrity of her clinique by Gregory, Abercrombie, and Alison in Edinburgh, to whom worthy counterparts were produced in Dublin by Graves, Stokes (already mentioned), and Corrigan. In the northern capital Christian, the Begbies, father and son, from Scotland, together with Robert and Henry Currie, held the fame of the school, and north of the Tweed Parkes, Murechison, Hilton Fagg, and Jenner have been bequeathed a rich harvest of practical doctrine to their successors. Italy, with Galvani, Volta, Nobili, and Matteucii, is the parent of electro-therapeutics; yet it is to Germany that modern medicine owes its greatest and most productive achievements. Vienna, under Van Swieten and Auenbrugger, had already won a European name for clinical research when Skoda enhanced it by improving on Laennec's 'auscultation,' and Bichat, in going over the Linnamberger carried Viennese teaching to the highest pitch of academic efficiency. Romberg is another representative name; but Schönlein, by the unanimous voice of Germany, has placed her in the van of medical progress. Founder of the modern 'natural history school,' his teaching has led up to bacteriology, which already in the hands of such men as Pasteur and Koch has for cholera, malaria, in, and tuberculosis (see TUBERCELE) become one of the most powerful instruments of which medicine, in diagnosis and even in practice, has yet been possessed. In the development of clinical thought, in cerebral physiology, from Iroon to Hitzig and Ferrier, have had great results in practice, surgical as well as medical; and the Americans have done splendid work, especially in thrapies.

Häser’s Grundzüge der Geschichte der Medizin (Jena, 1846, and Schaumann, 3rd edition, increased, 1872). Untersuchungen (1841-1859) have been closely followed in the foregoing article. The student who wishes to pursue the history of medicine into minutest detail should consult the work of Hildebrand in the same authors (Jena, 1875-79); Darrangrin’s Histoire des Sciences Médicales (2 vols., Paris, 1787); and Pucinelli’s Storia della Medicina (3 vols., Pisa, 1859). For a key to the various schools, see the article on Psychology and the appendices to Anatomy. See also SURGERY, HYGIENE, BACTERIA, GERMAN THOUGHT, and the notices of Hippocrates, Galen, and other great physicians.
is represented by a modern erection hard by. There seems no reason to doubt that the Prophet was buried in the space (originally Ayeshah’s hut) now enclosed in the mosque; nor is it likely that the grave was ever rifled. That his coffin, said to contain his body, which is in silver (no European has ever seen it), rests suspended in the air is of course an idle Christian fable. Of the treasures which this sanctuary once contained, little now remains. It is a meritorious act to perform the pilgrimage to Medina, though there is little of interest in it. As Mecca, a great number of ecclesiastical officials are attached in some capacity or other to the Great Mosque; and not only they, but many of the towns-people live to a great extent on the pilgrims’ alms and custom. There are few other noteworthy spots in Medina, save the minor mosques of Abu-bekr, Ali, Omar, Bilal, &c. Thirty Medressas, or public endowed schools, represent what learning there is left in the city, once famed for its scholars and theologians. In the 7th century Medina was the capital of the ‘Abbasid Caliphate; but since then it has passed under the rule of emirs, sheriffs, Turkish pashas, and Wahabis, though the internal government of the city is still Arabian.

 Medina Sidonia, a city of Spain, 25 miles SSE. of Cadiz, stands on an isolated hill overlooking a plain, and has the ruins of a castle, the ancient seat of the Frankish Sidons. Sidons is the name of the descendants of Guzman the Good, conqueror of Tarifa (1292). It was a member of this house who commanded the ‘invincible Armada.’ (q.v.), Pop. 12,307, who make pottery.

Medinet-el-Fayyun. See Fayyum.

Mediterranean Sea, so named from lying in the midst between the continents of Europe, Asia, and Africa. It is the largest enclosed sea in the world, and is connected with the open ocean only by the narrow Strait of Gibraltar, 9 miles in width at the Pillars of Hercules. Since 1869, however, it has been artificially connected with the Red Sea and Indian Ocean by means of the Suez Canal (q.v.). From this point the Mediterranean might be ranked with the oceans, but from being so completely cut off it presents distinctly local characters when compared with the great ocean-basins, and is consequently of special interest to the student of physical science. The Mediterranean lies in the nearly equatorial belt, and is about 2200 miles in length from the Strait of Gibraltar to the Syrian coast; its width varies from 500 or 600 miles in some places to less than 100 miles between Sicily and Cape Bon, where it is divided by relatively shallow banks into two distinct hydrographic basins, the eastern one being the largest. It is connected with the Black Sea through the Dardanelles, the Sea of Marmora, and the Bosporus. The African and Syrian coasts are comparatively even and unindented, the wide gulfs of Gabes and Sidra scarcely presenting an exception; on the other land, the shores of Etruria and Asia Minor are cut into numberless gulfs and bays, the largest of which is the Adriatic Sea. Various parts of the Mediterranean have been known by special names, such as the Tyrrhenian and Adriatic on the western, and the Levant, Aegean, and Ionian Seas in the eastern. The principal islands in the western part are Sardegna and Corsica, the Balearic and Lipari Islands, the two latter groups being of volcanic origin. The continental islands of Sicily and Malta are situated on the banks of the two great gulfs of Taranto, Messina, Lido, and Graham Island (now reduced to a shoal) are, however, volcanic though situated on the same banks. In the eastern regions there are the large islands of Cyprus and Crete, with the Ionian Islands and the islands of the Archipelago. The Mediterranean is frequently subject to earthquakes, and Vesuvius, Stromboli, and Etna are among the most famous of active volcanoes. The surface of the shores of this great sea is varied, mountain-ranges and high tablelands predomining. Although there is considerable diversity between the climates of Northern Italy and the desert shores of North Africa, still the terrestrial climate and sea vary not much. As in Mecca, a great number of ecclesiastical officials are attached in some capacity or other to the Great Mosque; and not only they, but many of the towns-people live to a great extent on the pilgrims’ alms and custom. There are few other noteworthy spots in Medina, save the minor mosques of Abu-bekr, Ali, Omar, Bilal, &c. Thirty Medressas, or public endowed schools, represent what learning there is left in the city, once famed for its scholars and theologians. In the 7th century Medina was the capital of the ‘Abbasid Caliphate; but since then it has passed under the rule of emirs, sheriffs, Turkish pashas, and Wahabis, though the internal government of the city is still Arabian.

Mediterranean Sea, so named from lying in the midst between the continents of Europe, Asia, and Africa. It is the largest enclosed sea in the world, and is connected with the open ocean only by the narrow Strait of Gibraltar, 9 miles in width at the Pillars of Hercules. Since 1869, however, it has been artificially connected with the Red Sea and Indian Ocean by means of the Suez Canal (q.v.). From this point the Mediterranean might be ranked with the oceans, but from being so completely cut off it presents distinctly local characters when compared with the great ocean-basins, and is consequently of special interest to the student of physical science. The Mediterranean lies in the nearly equatorial belt, and is about 2200 miles in length from the Strait of Gibraltar to the Syrian coast; its width varies from 500 or 600 miles in some places to less than 100 miles between Sicily and Cape Bon, where it is divided by relatively shallow banks into two distinct hydrographic basins, the eastern one being the largest. It is connected with the Black Sea through the Dardanelles, the Sea of Marmora, and the Bosporus. The African and Syrian coasts are comparatively even and unindented, the wide gulfs of Gabes and Sidra scarcely presenting an exception; on the other land, the shores of Etruria and Asia Minor are cut into numberless gulfs and bays, the largest of which is the Adriatic Sea. Various parts of the Mediterranean have been known by special names, such as the Tyrrhenian and Adriatic on the western, and the Levant, Aegean, and Ionian Seas in the eastern. The principal islands in the western part are Sardegna and Corsica, the Balearic and Lipari Islands, the two latter groups being of volcanic origin. The continental islands of Sicily and Malta are situated on the banks of the two great gulfs of Taranto, Messina, Lido, and Graham Island (now reduced to a shoal) are, however, volcanic though situated on the same banks. In the eastern regions there are
winter. The evaporation from the surface of the Mediterranean exceeds both the precipitation and the annual discharge of the rivers flowing into it from the surrounding catchment basin, for we find the specific gravity of its waters (1:02800 to 1:03000) to be greater than that of the Atlantic on the west (1:02770 to 1:02790) and on the east (1:012 to 1:014). There is even an outflow of warm dense Mediterranean water into the Atlantic beneath the lighter Atlantic water which flows in at the surface through the Strait of Gibraltar. There is a similar state of things at the entrance of the Black Sea; and the inflow of fresh water from the Black Sea at the surface, and an outflow in the opposite direction of saltier Mediterranean water by an undercurrent. Were it not for the inflow of Atlantic water the Mediterranean would slowly become saltier, and shrink till reduced to two-thirds. The Mediterranean region appears to be a tideless sea. At Algiers there is a rise of 33 inches at springs and half that amount at neaps; at other places the rise and fall is about 18 inches, and in the Gulf of Gabes the range reaches 20 ft. but the tides are not complete, being as much as 4 ft. incomplete by the rise of level and the surface currents produced by the action of the winds. The deposits now forming in the Mediterranean in deep water are all blue muds, with a yellowish upper layer, containing usually from 10 to 30 per cent. of carbonate of lime, which principally consists of the shells of pelagic Foraminifera. The mineral particles and clayey matter are derived from the disintegration of the neighbouring land. In some of the shallower depths there are glauconite and more calcareous deposits. The deep-sea strudings show that life, though present, is much less abundant in deep water than at similar depths in the open ocean, in which respect the Mediterranean agrees with enclosed seas in general. There is an extensive red coral fishery and tunny fishery on some parts of the coasts. The Mediterranean region appears to have been covered by the sea from early geological times, and during Tertiary times must have had much wider communication with the open ocean.

Medjidie, an Ottoman decoration, instituted in 1852 by the Sultan Abd-ul-Medjid as a reward of merit either civil or military. It was conferred after the Campaigns of 1853, on individuals and in an exceptional extent, on British officers. The order consists of five classes, and the decoration is a silver sun of seven triple rays, with the device of the crescent and star alternating with the rays.

Medlar (Mespilus), a genus of trees or shrubs of the natural order Rosaceae, sub-order Pomeae, having a 5-cleft calyx with leafy segments, nearly round petals, a large honey-secreting disc, and 2-5 styles, united together in the flower, but widely separated on the fruit, the upper ends of the bony cells of which are exposed. The Common Medlar (M. germanica), a small tree, spiny in a wild state, but destitute of spines in cultivation, is a native of the south of Europe and of the temperate parts of Asia, but is a doubtful native of Britain, although it is to be seen in hedges and thickets in the southern parts of England. It has lanceolate, entire leaves, and the tough, brown, hairy peduncle becomes soft, the end of small spurs, and globular or pear-shaped fruit. The medlar is much cultivated in some parts of Europe, and is common in gardens in England, but it does not generally ripen well in Scotland without a wall. It is very anesthetic, but when Medlar wine, or Medlar punch was made, it was enriched with treacle and made very strong, and vinous by incipient decay, it is relished by many.

Medmuncham, a village of Buckinghamshire, near the Thames, 3 miles SW. of Marlow. Here stood a Cistercian abbey (1204); and here, soon after the middle of the 18th century, Sir Francis Dashwood, afterwards Lord le Despencer (1708-81), founded his mock brotherhood of 'Franciscans,' whose motto was the familiar inscription on Rabelais' abbey of Thelema, 'Fay ca que vous m'avez, and the two members were John Wilkes and Pml Whitehead the poet. Pop. of parish, 336. See W. Fraser Rae's Wilkes, Sheridan, Fox (1874).
reduced to powder, mixed into a paste, and compressed into hard masses, which are carved into inferior pipes.

**Meerut.** or more correctly Merath, a town, district, and division in the North-western Provinces of British India. The town lies 40 miles N.E. of Delhi, about half-way between the Ganges and the Jumna. Its most important edifice is the English church, with a fine spire and an excellent organ. There are also several ruins of native edifices. Here in 1837 the great mutiny broke out (see INDIA, in Vol. VI. p. 119). Pop. (1881) 99,565; (1891) 119,390, of whom 40,000 were in the cantonment. The district has an area of 2370 sq. m., pop. 1,391,458; the division, 11,330 sq. m., pop. 4,834,064.

**Megaceros.** See Elk.

**Megalichthys** (Gr., 'great fish'), a genus of extinct Ganoid fishes. Their remains found in Carboniferous strata testify to fishes of large size, completely bucklered by big strong smooth scales. The jaws bear large conical teeth suggestive of predaceous carnivorous habits.

**Megalithic Monuments.** See Dolmen, Standing Stones, Stone Circles, &c.

**Megalonyx.** A large fossil edentate of the United States, smaller than the Megatherium (q.v.).

**Megalopolis.** founded by Epaminondas after the battle of Leuctra (371 b.c.), and made the capital of Arcadia, stood in the valley of the Helisson. Plundered and mostly destroyed by the Spartans in 222 b.c. It was the birthplace of Philopmen and Polybius. Here the British school at Athens conducted excavations in 1892-93.

**Megasaurus** (Gr., 'great lizard') a gigantic extinct reptile, whose remains are found in Jurassic and Cretaceous strata. The huge body seems to have measured about 30 to 50 feet in length, and the formidable teeth suggest a carnivorous diet. See Reptiles.

**Megapodida.** See Mound-Birds.

**Megaliths.** a small mountainous region of Hellas, or triplece proper, lying between Attica and the Isthmus of Corinth. The people were excellent sailors, and founded several colonies, of which the most famous were Byzantium (667 B.C.), Chalcis, and Megara (q.v.) in Sicily. They were generally regarded as guilty of deception and dissimulation, hence the phrase 'Megarian tears.' The capital was Megara, long an important commercial city, and famous for its white shell marble, and for a white of which pottery was made.—From Euclid (q.v.) the philosopher, who, as well as Thucydides the poet, was born at Megara, the Megaric school took its name.

**Megas*;*thenes,** a Greek ambassador stationed by Seleucus Nicator (306-295 B.C.) at the court of Sandrocottus (q.v.), or Chandravasa, in the valley of the Ganges. Here he gathered materials for his work Indica, from which Arrian, Strabo, and others borrowed. The fragments that remain have been edited by Schwabebeck (1840) and Müller (1848).

**Megatherium** (Gr., 'great beast'); a gigantic extinct quadruped of the order Elephantia, nearly allied to the sloth, found in the Pleistocene deposits of South and North America, but more particularly in those of the South American pampas. In structure it is very near its modern representative, except that the whole skeleton is modified to suit the approach of an immense heavy-laden and heavy-лежаed animal, fully equal in bulk to the largest species of rhinoceros. The appellation tarанlgrade, which Cuvier applied to the sloth, cannot be given to the Megatherium: its limbs were comparatively short and very strong, and the feet adapted for walking on the ground, approaching the foliage of which it browsed. The enormous development of the bones of the pelvis, the hind-legs, and the tail, gave the animal great power when, seated on its hind-legs and tail, as on a tripod, it raised its fore-legs against the trunk, and applied its force against a tree that had already been weakened by having its roots dug up. The structure of the lower jaw seems to indicate that the snout was prolonged and more or less flexible, and it seems probable that the Megatherium was furnished with a prehensile tongue like that of the giraffe, with which it stripped the foliage from the trees. The remains of several allied genera of huge Edentata are associated with the Megatherium in the deposits on the pampas. They form the family Megatheriidae of Owen, which includes Mylodon, Megalonyx, Sebalatherium, &c.—genera which are separated from Megatherium chiefly from peculiarities in the dentition. The modern sloth is a native of South America, and the fossil remains of these immense creatures, which represented it in the newer Tertiaries, are found only in the American continent.

**Megabna,** the estuary of the Ganges (q.v.) and Brahmaputra (q.v.). See Map at CALCUTTA.

**Megiddo,** an ancient city of Palestine, the site of which is somewhat uncertain, in the plain of Esdraelon. In the battle there Josiah (q.v.) was slain in 609 B.C.

**Meglip.** See Magilp.

**Megrim.** See Headache.

**Megrimos** and **Vertigo** are the terms usually applied when a horse at work reels, and then either stands for a minute dull and stupid, or falls to the ground, lying for a time partially insensible. These attacks come on suddenly, are often periodical, and are most frequent during hot weather and when the animal is drawing up a hill, or exposed during heavy work to the full rays of a hot sun. Liability to megrim constitutes unsoundness, and usually depends upon the circulation through the brain being temporarily disturbed by the presence of tumours, or by weakness of the heart's action. Horses subject to megrim are always dangerous; if driven at all, they should be used with a breast-

the time of the Emperor Claudius; nothing else is known concerning him. His work, an unsystematic compendium, is in three books, and is entitled De Sylva Orbis. The text is greatly corrupt. The editio princeps appeared in Leipzig in 1473; the best modern edition is that by Parthey (Berlin, 1867).

Melaleuca. See CAJUPUT.

Melanchthon. See INSANITY.

Melanchthon, Philip, Luther's fellow-labourer in the Reformation, was born, February 16, 1497, at Hretten, in the Palatinate of the Rhine, now in the grand-duchy of Baden. His name was originally Schwarzeld ('black earth'), of which Melanchthon is a Greek translation. He was educated at the university of Heidelberg, where he took the degree of Bachelor of Philosophy in 1512. In the same year he went to Tbingen, studied theology, took the degree of Doctor, and in 1514 gave lectures on the Aristotelian philosophy and the classics. About this time he published a Greek grammar. On his relative Rhenelinc's recommendation he was appointed in 1518 professor of Greek in Wittenberg. Brought into contact with Luther in that town, he at once became his fellow-worker in the great religious revolution with which Luther's name is identified. Melanchthon brought to his aid his abilities, and in his long life, deeply regarded as another Erasmus, and a gift of lucid exposition and purity of Latin style unrivalled among his contemporaries. The natural sweetness of his temper and the habitual meekness of his views, added the advantageously tempered Luther's vehemence. In 1521 he published his Loci Communes Rerum Theologicarum, the first great Protestant work on dogmatic theology. It passed through more than fifty editions in the course of the author's life. In 1530 he made a most important contribution to the cause of Protestantism, in the Augsburg Confession (q.v.). In 1541 he went to Worms, and soon after to Ratisbon, to conduct the cause of the Protestants in the conferences there. But the influence of the papal legate counteracted all his efforts for a peaceful accommodation, and his own party were much dissatisfied on account of the concessions which he made. After Luther's death, Melanchthon lost in some measure the confidence of some of the Protestants by those concessions to the Catholics which his anxiety for peace led him to make; whilst the zealous Lutherans were no less displeased because of his approximation to the doctrine of Calvin on the Lord's Supper. His consent, conditionally given, to the introduction of the Augsburg Interim (q.v.) in Saxony, in 1549, led to painful controversies, which filled the latter years of his life with discomfort. He died at Wittenberg, 19th April 1560. By his calm wisdom and the reputation of his genius, Melanchthon did much to save the Reformation from those excesses that would have made its progress impossible. In the task he has incurred much opposition from Luther himself, and still more from the enthusiasts who came to the front after Luther's death; but the subsequent religious history of Germany is conclusive proof of the wisdom of his advice. By his labours as a scholar and public teacher Melanchthon ranks with the very highest names in the history of learning and education. Alike by his temper and intellectual interests, he is to be regarded as blending in the happiest proportion the humanist and the reformer. The most complete edition of his works (which comprise a Greek and Latin Grammar, editions of and commentaries on several classics and the Septuagint, biographical comments, doctrinal and ethical works, official documents, declarations, dissertations, responses, and a very extensive correspondence with friends and the leading men of the age) is that by Breslau and Bindseil in their Corpus Reformatorum (28 vols. 1834-60).

See Lives of Melanchthon by his friend Camerarius (1566) by Cox, Matthes (Altenb. 1841), Nikisch, Schmidt (Elberfeld, 1857), Meurer (Str. Leip. 1869), Schaff (London, 1887), Hartfelder (Berlin, 1889), Bailey Saunders (1887), George Wilson (1888), and A. Harnack (1898).

Melanesia (Gr. melas, 'black') is a name given to those Pacific islands near New Guinea which are inhabited by the Papuan race. See POLYNESIA.

Melaphyrs. See BASALT.

Melbourne, in Derbyshire, 7 miles SE. of Derby by rail; pop. 3123. It is noted for its market-gardens, and has some manufactures. Melbourne Hall, formerly seat of Lord Melbourne, belongs to Earl Cowper.

Melbourne, the metropolis of the Australian colony of Victoria, and the most important city of Australasia, stands at the northern extremity of Port Phillip Bay, and is bisected by the river Yarra; it is in 37° 49' S. lat. and 144° 58' E. long. To facilitate navigation and enable large vessels to discharge their cargoes almost at the doors of the warehouses, a canal was cut from a point near the mouth of the river to the Melbourne quays and opened in 1888. Williamstown and Port Melbourne, built on the shores of the bay, give extensive pier accommodation, and are thriving ports. Melbourne is a chessboard city, built on strict mathematical lines. Its streets intersecting at right angles, the principal thoroughfares being of considerably greater width (99 feet) than is necessary or desirable in such a warm climate.

Collins Street is architecturally imposing, being lined on either side by tall, massive, and ornate buildings, chiefly banks, offices, warehouses, and hotels. Bourke Street corresponds to the London Strand; but it is three times as wide and four times as long. Here most of the theatres, music-halls, and retail shops are situated. An extensive system of cable tramway locomotion was inaugurated in 1886.

Melbourne has a flourishing university, founded in 1853 largely through the instrumentality of Mr Childers, its first vice-chancellor. There are three affiliated colleges in its immediate vicinity—Trinity (Episcopal), Queen's ( Wesleyan), and Ormond (Presbyterian). The last—one of the finest educational structures in the southern hemisphere—was built at the expense of the Hon.
Melbourne, William Lamb, Viscount, statesman, was second son of Peinston Lamb, first Viscount Melbourne, and was born in London, 13th March 1779. His education he received at Eton, at Trinity College, Cambridge, and at Glasgow. He entered the House of Commons for Leominster in 1805 as a Whig, a follower of Charles James Fox. But having become a convert to Canning's views, he accepted in 1827 the chief-secretaryship of Ireland in his government, and continued to hold the post under Lord Goderich and the Duke of Wellington. In 1828 the death of his father transferred him to the Upper House. Returning to his allegiance to the Whigs, in 1830 he took the seals of the Home Office in the government of Earl Grey, and in July 1834 succeeded his chief as prime-minister, but only remained at the head of affairs until the ensuing general elections. Peel, however, gave way to Melbourne again in 1835; and he continued in office when Victoria ascended the throne (1837). He succeeded by his uncommon tact in introducing her pleasantly to the various duties of a constitutional monarch. In 1841 he once more pressed the seals of office to Sir Robert Peel, and thenceforward took little part in public affairs. He was ineffective as a speaker, but displayed aptitude for affairs and common sense in the ordering of them. His easy cheerful temper and cordial frankness of manner gained him many friends. Sydney Smith, in his second letter to Archdeacon Singleton, has described his character with an
Melchites, the name given to a body of Christians in Syria, Palestine, and Egypt, who acknowledged the authority of the pope, and accept the doctrines of the Church of Rome, but use the liturgy and ceremonies of the Greek Church. They conduct divine service in the vernacular tongue, receive the Lord's Supper in both kinds, and follow the Eastern Calendar. Their priests need not be celibate. The anti-legal king-priests are the chief ex., as a figure typical of the viceroy of Jehovah, and in Hebrews, vii. 3, of the kingly priesthood of Jesus. The chapter in Genesis containing his story stands alone in character in the Pentateuch, and existing in all forms of the Old Testament is one of its latest additions. As to his being 'without father and without mother,' it may be noted that Abd-Kiba, king of Jerusalem, in the Tell-el-Amarna tablets says of himself: 'Neither my father nor my mother appointed me in this place'—i.e. he was elective, not hereditary king.

MELCOMBE REGIS, See Weymouth.

Melcombe Regis, formerly Marignano, is a town 12 miles SE. of Lyme Regis. Pop. 5,438. Here Francis I. of France defeated the Swiss in 1515, and the French routed the Austrian rear-guard in 1559. Mellick, a town of Southern Italy, 30 miles N. of Potenza. The once magnificent cathedral (1153) was ruined by an earthquake in 1857. Melili, the Norman capital of Apania. Pop. 11,755.

Melford, Long, a picturesque village of Suffolk, 13 miles S. of Bury St Edmunds by rail. It has a very fine Perpendicular church 260 feet long. Pop. of parish, 3,035. See two works by Sir W. Parker (1873) and E. L. Conder (1888).

Mellifa, a Spanish 'Presidio' (q.v.) and convict station on the coast of Morocco, 8 miles SE. of Cape Tres Forcas, defended not without mishap and difficulty against the Berbers of the Rif in 1893. It has been held by Spain since 1496.

Mellilot (Melilotus), a genus of clover-like plants of the natural order Leguminosae. The Common Mellilot, a yellow-flowered annual, common in Britain, has when in flower a peculiar sweet smell, resembling the scent of burnt Bean, which increases in drying. The flowers and seeds are the chief ingredients in flavouring Gruyere cheese. The Blue Mellilot (M. cornutus), a native of the north of Africa, with short racemes of blue flowers, is cultivated in many parts of Europe, particularly in Switzerland and Tyrol, and has the peculiar melliflous odour in a high degree. The name Bokhara Clover has been given to one or more species.

Melinite, an explosive obtained from Picric Acid (q.v.), itself a powerful explosive, by the direct action of nitric acid. The five explosive properties attributed to melinite when introduced for artillery purposes (for shells) by General Boulangier in 1886 have not been realised; it was found to be neither stable nor reliable, and caused some fatal accidents. Lydite (q.v.) is similar, but safer.

Melphage, See Honey-eater.

Melissic Acid. See WAX.

Mellifont Abbey, a ruin standing 4 miles N.W. of Drogheda, was the first Cistercian foundation in Ireland, founded by St Malachi (q.v.) in 1142. In 1539, when it surrendered to Henry VIII's commissioners, it had 140 monks. Its remains were excavated during 1884-85. See Mellifont Abbey, by K. F. B. (1886).

Melon, a town of Cerro Largo in Uruguay, on the Tucuman there crossed by a stone bridge, 'built in 1865 by a Frenchman who was murdered for collecting toll' (Mulhall). Pop. 5,000.

Melodeon, an instrument of the type of the Harmonium (q.v.), superseded by the American organ. In 1859 over 20,000 melodeons were made in the United States. The name is also applied to an improved variety of the Accordion (q.v.).

Melodrama (Gr. melos, 'a song,' and drama) strictly denotes a half-musical drama, or that kind of dramatic performance in which declamation is interrupted from time to time by instrumental music. The name, however, which was first applied to the opera by its inventor, Ottavio Leoni (1710-82), seems to designate a romantic play, depending mainly on sensational incidents, terrorising situations, and an effective denouement. Great sums are spent in the staging of such pieces, and the costumes, scenery, and mechanical effects are often very striking. The expression 'transpontine drama' refers to a time when such plays were identified with houses on the Surrey side of the Thames: nowadays the home of melodrama in London is to be found in such theatres as Drury Lane and the Adelphi.

MELON (Cucumis melo), a plant of the same genus with the Cucumber (q.v.), much cultivated for its fruit, which is sweet, juicy, and of peculiar flavour and smell. The melon is an annual, with trailing or climbing stems, lateral tendrils, rounded angular leaves, small, yellow, monoeccious flowers, and large round or somewhat ovate fruit. It is supposed to be a native of the subtropical parts of Asia, although it has never been discovered in a wild state. Its English name was originally Musk Melon. The varieties in cultivation are very numerous, some of them distinguished by a thick and warty rind, some by a rind cracked in a net-like manner, some by ribs and furrows, some by a peel that is but slightly wrinkled, but they differ also in the colour of the flesh of the fruit, which is green, red, yellow, &c.; and in the size of the fruit, which varies from 3 or 4 inches to a foot or more in diameter. The melon is eaten either by itself or with sugar, and sometimes with pepper, or cumin, or other spices, and in specially constructed boughouses is extensively carried on in all parts of Britain, and very great care is bestowed on it. A loamy soil is best suited to it. The setting of the fruit by dusting with a solution of the pollen of the male flower is constantly practised by gardeners. Warthum and bright sunshine are requisite to the production of fruit of good quality. The Water Melon or Citron (C. citrinus), although rarely

exquisite mixture of sarcasm and compliment. Melbourne died November 24, 1848. He married (1805) a daughter of the Earl of Bessborough, who, under the title of Lady Caroline Lamb (1785-1828), was famous for her beauty and novel-writing, besides notoriety from her relations with Lord Byron. The charge brought against him by the husband in 1836 of seducing the famous Mrs Norten was thrown out by the jury without hearing the case.
MELOS

cultivated in Britain, is highly esteemed and much cultivated in almost all warm countries. It is a native of the warm parts of the Old World. It has deeply lobed and gashed leaves, and a large round fruit with smooth dark-green spotted rind, and pink or white flesh, less sweet than the melon, but much more juicy or watery, and therefore much prized in many warm countries. In America it is only the water melon that is ever called simply melon; for the other the old English name is retained where 'cantaloupe' is not used. In South Carolina the water melon has reached 45 lb.—South Africa has another species of Water Melon, (C. Cajffer), very valuable to the inhabitants. —The Chate (C. Chate) is a native of Egypt and Arabia. —The Kaukoor (C. utilissimum) is a native of India, and much cultivated in some parts of that country; it has oval, smooth, variegated with different shades of yellow, and about 6 inches long, with much the flavour of the melon. The fruit will keep for several months, and is much used in manna both raw and in curries. The half-grown fruit is pickled. The seeds contain much farina and oil, and are ground into meal; the oil is expressed, and used both for food and in lamps. The seeds of others of this genus are used in the same way; and they are said to be useful as a diuretic medicine.

Melos (Ital. Milo), a Greek island, the most south-westerly of the Cyclades, 13 miles long by 8 broad, with 4200 inhabitants. The island is volcanic, and produces sulphur, salt, pumice-stone, stucco, millstones, and a little oil and wine. Amongst the ruins of the ancient city of Melos, and near its theatre, was found the priceless antique, the Venus de Milo, now one of the chiefest treasures of the Louvre. See VENUS.

Melpoménec ('the singing one'), one of the nine Muses, the representative of Tragedy.

Melrose, a pleasant little town of Roxburghshire, on the south bank of the Tweed, and at the north base of the triple Eildons (q.v.), 37 miles SSE. of Edinburgh by rail. At Old Melrose, 23 miles farther east, was founded about 635 the Columban monastery, of which St Cuthbert (q.v.) became a monk. It was burned by Kenneth MacAlpine in 839, and had been quite deserted for upwards of fifty years, when in 1130 the great Cistercan abbey of Melrose itself was founded by David I. Twice burned by the English, this was slowly rebuilt on a scale of increased magnificence between 1322 and 1505, only forty years after which date two fresh English invasions commenced the destruction that was speedily completed by the Reformers. The abbey was in the Second Pointed style, with approaches to Third Pointed, and was more doubt the most beautiful structure of which Scotland could boast in the middle ages. What now remains is the ruined conventual church, 215 feet long by 116 across the transepts, with some fragments of the cloister, which seems to have been a square of 150 feet. The carvings and traceries, hewn in a stone of singular excellence, are scarcely surpassed by any in England. Melrose shames in Scott's pages with a splendour its mesange history fails to sustain. The accession of St Walthard, the royal founder's stepson; Alexander II. and Johanna, his queen; the heart of Robert Bruce; the good Sir James, the Knight of Liddesdale, the hero of Otterburn, and others of the Douglas line; the 'wondrous Michael Scott;' and Sir David Brewster—all these are buried here; else, the annals of Melrose have little to record. A burgh of barony since 1609, the town possesses a market-
cross (1642), a suspension foot-bridge over the Tweed (1826), a hydropathic, (1871), and half a dozen hotels, it being a great tourist centre, as well for its ability from the vicinity of Abbotford, Dryburgh, &c. Pop. (1841) 893; (1891) 1432.

See the Chronica de Malesv 731-1275, ed. by Joseph Stevenson (Bannatyne Club, 1835); the Liber S. Marie de Melos, ed. by Cosmo Innes (Bannatyne Club, 1837); Scott's Abbott and Ley of the Last Minstrel; and works by Waide (1861) and Finches (1879).

Melting-point. The following are some of the most important melting-points, which may also be regarded as the freezing-points of the corresponding liquids:

Melting-points beyond about 900° or 1000° F. are merely approximate and relative.

Melton-Mowbray, a town of Leicestershire, in the centre of a great hunting district, is seated on the river Eye near its junction with the Wreak, 15 miles NE. of Leicester, and 104 NNW. of London. It has a fine cruciform church, mainly Early English, and is famous for its manufactures of pork pies and Stilton cheese, chiefly for retail in the London, Manchester, and Leeds markets. Near the town in February 1644 a severe engagement took place between parties of royalist
and parliamentary troops, resulting in the defeat of the latter; and amongst its natives have been Archbishop de Melton, who lies buried in the church, and Henry Hibyn. Pop. (1801) 1766; (1811) 5892; (1891) 6392.

Melun, the capital of the French department of Seine-et-Marne, on the Seine, near the Forest of Fontainebleau, 28 miles S.E. of Paris. It has two interesting churches, and manufactures of leather, pottery, &c. Melun, the Melodulbus of Caesar, fell into the hands of the English after a siege, and was held by them for ten years. Pop. (1872) 11,098; (1891) 12,792.

Melusine, or Melusina, the name of a fairy lady who figures prominently in the celebrated medieval French romance so called, the motif of which is similar to that of the legend of Eros (Cupid) and Psyche, is of far-reaching antiquity, and has many parallels and analogues in the legends and popular fictions of Irish, Scottish, and English folklore. In the myth of Cupid and Psyche the mortal maiden is not to behold her celestial spouse; but, incited by her envious sisters, she takes a lighted lamp to look upon him one night as he lies asleep, and, in her agitation at beholding his marvellous beauty, she falls from the tree on which she was perched, whereupon he and the splendid palace vanish, and Psyche finds herself on a desolate heath. She is reunited to him, however, after performing a number of seemingly impossible tasks by order of her vindictive mother-in-law, Venus. This myth has deeply penetrated European folklore. In a Sicilian tale a girl is married to a green bird, who changes to a handsome young man on bathing in a pan of milk. She is not to ask his name. In a Norse tale a princess is bewitched by his stepmother, so that he is a white bear by day and a man by night; in a Danish tale, a wolf; in a Chilian tale (of European origin doubtless), a hideous black man; and, in all three, and many other analogues and variants, the bride loses her enchanted spouse for a time in the same manner as in the Greek myth, which several learned scholars have endeavoured to interpret as typifying the natural phenomenon of the dawn.

One of the oldest legends of this class is the Hindu myth of Urvasi and Purvadas, the common ancestor of the two. A celestial nymph imposes on her husband being that she is not to see him naked, which Mr Andrew Lang (Custom and Myth) considers, with good reason, as signifying 'a custom of women. Presuming, the mother of Melusine, imposes on her husband, the king of Albany, the condition that he should never see her in child-

bed. He forgets his promise and loses his fairy spouse. According to a Spanish legend of the same family, a fairy, who consents to wed him if he promise never to pronounce a holy name in her presence.—In another Hindu legend, Bhek, the frog, is a maiden who consents to marry a king on the condition that he never shall be seen in the dress of a king. One day, she asked her husband for water, which he gave her, forgetting his promise, and she disappeared.

A very striking parallel to the legend of Melusine is found in a tale current among the Eskimos, in which a wandering youth falls in love with a maiden sitting on a rock by the shore, who takes him (like Undine with the knight in Fenqués charming tale) down into a subterranean palace, where she marries him, but imposes on him one condition, that he must not seek to see her on a Thursday. Curiously at length he marries of any his wife should do, however strange it might appear. Such conditions occur so frequently in the fairy tales of almost every people (see also Lohengrin); and it may be added that tales of Porthkennach, familiar to readers of the Arabian Nights, of which many examples are current in Europe, are closely allied to legends of the Urvasi and Purvadas, Eros and Psyche, and Melusine cycle.

See Max-Müller's Chips from a German Workshop, vol. ii.; Harington's Curious Myths of the Middle Ages; Cox's Mythology of the Aryan Nations (1870); Grimm's Teutonic Mythology (trans. Stallybrass); Clouston's Popular Tales and Fictions (1887); Clouston's Group of Popular Romances (1884); the old English version of the romance of Melusine, from the French of John of Arras (1887), printed for the Early English Text Society (1891), from a unique MS. of the 15th century. See also full account under the name of writer on the Cupid and Psyche and Melusina cycle of legends.

Melville, the name of an island, a sound, and a peninsula in the polar regions of North America. The island is crossed by 75° N. lat. and 110 W. long., and is separated on the west by Fitzwilliam Strait from Prince Patrick Island. Greatest length, 200 miles; greatest breadth, 130 miles. In 1819 Parry, who gave the island its name, passed the winter here with his crews. The sound, about 250 miles long by 200 broad, extends south-east of the island, and communicates with the Arctic Ocean on the west by Banks Strait, and with Baffin Bay on the east by Barrow Strait and Lancaster Sound. The peninsula projects from the continent at its north-eastern corner, and has on the N. the Fury and Hecla Strait, and on the E. Fox Channel. It is 250 miles in length by 130 miles in breadth.—Another Melville Island lies across the entrance to Van Diemen Gulf off the shore of the northern territory of South Australia. Area, 143 sq. m. It is hilly and covered with vegetation. The earliest British settlement on this coast was made here in 1824.

Melville, Andrew, a champion of Scottish Presbyterianism, was born 1st August 1545, at
MELVILLE

Melville, near Montrose, was educated at the grammar-school of Montrose, where he removed in his fourteenth year to the university of St Andrews. Here he remained four years, and left it with the reputation of being the best poet, and Grecian of any young master in the land. He then proceeded to Paris, where he continued his studies for two years. His reputation must have been already considerable, for in his twenty-first year he was chosen regent in the college of St Maureon, Poitiers. Soon afterwards he proceeded to Geneva, where through the influence of Beza, with whose opinions in religion and politics he already sympathised, he was appointed to the chair of Humanity in the Academy. On his return to Scot-land (1574) he was appointed Principal of the college of Glasgow, where he did the highest service to the cause of learning throughout the country. He had a very important share in drawing up that charter of the Presbyterian polity, the Second Book of Discipline (see Discipline). In 1580 Melville was chosen Principal of St Mary's College, St Andrews. Here, "besides giving lectures in theology, he taught the Hebrew, Chaldee, Syriac, and Rabbinical languages." In 1582 he preached the opening sermon before the General Assembly, and boldly "involved against the bloody knife of abuserly murder...and by the crown off Christ's head and to wrench the sceptre out of his hand." Two years later Melville was summoned before the Privy-council on account of a sermon preached at St Andrews; and to escape imprisonment he removed to London. Here he remained the downfall of Arran. His prolixity, however, and the division of his labours, he was repeatedly elected moderator of the General Assembly and rector of the university. At Cupar in 1614 Melville was impeached before a deputy, and "remon- strate' with the king; and when James reminded the zealous remonstrant that he was his vassal, 'Sirrah!' retorted Melville, 'ye are God's silly vassal; there are two kings and two kingdoms in Scotland: there is King James, the head of this commonwealth, and there is Christ Jesus, the king of the church, whose subject James the Sixth is, and of whose kingdom he is not a king, nor a lord, nor a head, but a member." In 1600 Melville, with seven other ministers, was called to England to crown and consecrate the king. Having fulfilled the service in the Chapel Royal, as a Latin oratorio, he was summoned before the English Privy-council, when he broke out into a torrent of invective against the Archbishop of Canterbury for encouraging popery and superstition, profaning the Sabbath, &c. The king, violating every principle of justice, immediately sent him to the Tower, where he remained for more than four years. In 1611 he was released on the solicitation of the Duke of Bouillon, who wanted his services as a professor in his university at Soisins in France. Melville, now in his sixty-sixth year, returned to England. See above. See also Sir James, but James would not listen to his request. Melville died about 1622, but neither the date of his death nor the events of his last years are ascertained. See M'Crie's Life of Melville (2 vols. 1819).

 mens, a Prussian seaport, defended by a citadel and two forts on the sea side, lies at the northern extremity of the Kurische Halff, at its opening into the Baltic, 76 miles N.N.E. of Danzig. It has a large harbour, and exports from Prussia and Russia timber, flax and linseed, coal, manganese, grain, and herring to the annual value of £900,000 to £1,000,000, timber constituting half the value; Great Britain takes one-third of the total. The imports, which generally exceed a million sterling, include the exports in transit, and textiles, colonial produce, and wine and spirits for local use. The town possesses manufactories of brandy, soap and chemicals, saw-mills, iron-foundries, breweries, and shipbuilding-yards. There is a good school of navigation. Pop. (1875) 19,796; (1890) 19,282. Memel was founded in 1252 by the Livonian order, who gave it to the Teutonic Knights, by whom it was fortified in 1404. It suffered severely in the Lithuanian wars (13th to 15th centuries). Here in 1607 Frederick William of Prussia obtained refuge, and a treaty with England was signed. Having been almost wholly destroyed by fire in 1834, it was rebuilt in modern style. For the river Memel, see Nien-Men.

MELKLING, or more correctly MELKLING, HANS, Flemish painter, was born at Mainz in the first half of the 15th century. He was connected with the church at Bruges, where most of his life was spent, on 11th August 1494. His painting gained him a wide reputation, extending even to England and Italy. His principal works are sacred subjects, such as 'The Last Judgment' (at Danzig), 'Seven Sorrows and Seven Joys of the Virgin', 'Marriage of St Catharine', 'Adoration,' several Madonnas, and the fourteen small paintings that adorn the shrine containing St Ursula's relics at Cologne; and portraits, as of Sir John Donne, of Burgo-
Memory. Diseases of. Memory, or the power of reproducing mental or sensory impressions, is impaired by organic disturbances of the nervous system, fevers, intertemperance, and various physical conditions. It is affected in all kinds of mental derangement, but is in a most signal manner obliterated or enfeebled in Dementia. There are, however, examples of memory surviving all other faculties, and preserving educated man could never have the slightest notion of long and complicated series of events amid general darkness and ruin of mind. Incoherence owes some of its features to defective or irregular memory. Cases of so marvellous an exaltation of this faculty as where a whole party of mentally delirious could be recited, or a whole play of Shakespear’s recited by a man at one time, which would be ordinarily impossible for him, are common in the beginning of attacks of mania, and always should suggest disease. There are, however, special affections of the faculty. It may be suspended while the intelligence remains intact. Periods of personal or general history may elude the grasp, and even that continuity of impressions which goes far to constitute the feeling of personal identity is broken up, and a duality or multiplicity of experience may apparently pervade the mind, and impressions that had completely faded away may, under excitement or cerebral disease, return. There are, besides, states in which this power is partially affected, as in the instances where the numbers 5 and 7 were lost, and where a highly educated man could not retain any conception of the letter F; secondly, where it is perverted, recalling images inappropriate and in an erroneous sequence of order or time, and different from what are desired; and thirdly, where, while the written or printed signs of ideas can be used, the oral or articulate signs are forgotten. Such examples of diseased memory are now classed as amnesic, simple loss of memory; amnesic aphasia, loss of memory of spoken words (see Aplasia); and amnesic agraphia, loss of memory of written words. Most of these special deviations from health intelligence remain unchanged in a very limited portion—Boea’s convulsion—of the left side of the brain. The discovery of this fact by Boea was the first of the brilliant discoveries as to the localisation of function in the brain cortex. See Feuchtersleben, Medical Psychology; and Ilbott, Les Maladies de la Memoire (1881).

Memphis, a celebrated Egyptian city, situated at the apex of the Delta, or Lower Egypt, the ancient capital of the country, called by the Egyptians Men nefer, or ‘the Good Station’, by the Hebrews Moph, and by the Arabs Menf. It was founded by Menes, the first monarch of the lst dynasty, who, according to Herodotus, changed the bed of the Nile, and made an embankment 100 stadia above Memphis to protect the new city against inundations, the remains of which still exist about 14 miles above Mitribat, and near the site of the temple of Ptah. Menes fortified the city, and laid the foundations of the temple. The site was well chosen; protected alike by the Libyan and Arabian chains of mountains against the river and the incursions of the sea, defending it by the incursions of Asiatic nomads, and communicating with the Red Sea and the Mediterranean. The city, which at one time had a circumference of 130 stadia, was composed of two portions—one built of crude bricks, the other, on which the city was laid out and enlarged after the foundation built by Menes, was enlarged by his son Athebas, and was always inhabited either by a monarch or by his viceroy. After the 6th dynasty the city declined in importance, and was apparently held by....

MENCUS

the Hyksos after the 13th and before the 18th (1500 B.C.), during which time this city was ruled by a viceroy, a prince of the blood, and still remained a religious capital. It rose again to great importance under the Satte monarchs, about 600 B.C., who restored it; and it was conquered by Sen- nacherib. Its temples were magnificent, and con- sumed the treasure from the temple of Ptah by Amasis II, just prior to Cambyses (252 B.C.); a temple dedicated to Proteus, in the foreign quarter; the temple of the Apsis, having a peristyle and court ornamented with figures, opposite the south propylæum of the temple of Puth, where the sacred Dwarf; the Serapeum, or temple of Serapis, discovered by M. Mariette; the Nilometer; a temple of Ina; and the shrine of the Cabiri. Here were the statues of Rameses II., one of which is known as 'the fallen colossal,' at Mitretham. Still more remarkable was the great necropolis of the city, in the centre of which towered the pyramids (see PYRAMIDS). During the attempts of the native rulers to throw off the Persian yoke, Memphis was an important strategic point. Oehus inflicted severe injury on this town, leaving it in ruins. The pyramids still remain, and the walls of the city after he had driven out Nectanebo. Alexander the Great here worshiped the Apsis, and his corpse was brought to this city by Ptolemy before it was finally transferred to Alexandria. The first Ptolemies were crowned in the Serapeum. Ptolemy VIII. destroyed the city, and it fell with the rest of Egypt under the Roman rule, and afterwards was conquered by 'Amur ibn el-Asi (410 A.D.). Its ruins, which served as quarries for later buildings, were large and important in the 13th century, when they were seen by Abul- Lati who was unable to be seen by most deeply buried walls. See works cited at EGYPT.

Memphis, a city and port of entry of Tennessee, stands on a high bluff on the east bank of the Mississippi River, 826 miles above New Orleans, and 230 miles by rail WSW. of Nashville. The river to this point is navigable for the largest sea-going vessels, and a little further than the line of railway terminate here; the trade of Memphis is accordingly very large. It is a handsome town, with wide, regular streets, and great warehouses bordering the esplanade that extends along the bluff. The public buildings include a custom-house, cotton exchange, a large hospital, a Richelieu Catholic college, and numerous churches. Memphis is one of the first cotton marts in the United States, and has numerous manufactories. The city was visited by fearful epidemics of yellow fever in 1875 and 1879, since its drainage has been reconstructed. A great steel cantilever railway bridge across the Mississippi was opened in 1892; it has five spans, and a total length of 1886 feet. Pop. (1850) 8841; (1870) 40,220; (1880) 33,592; (1900) 102,320.

Menado. See Celebes.

Ménage. GILES, a French writer, born at Angers in 1613, gave up the bar for the church, but chiefly spent his time in literary pursuits. He founded, in opposition to the Academy, a salon, the Mercure, which gained him a European reputation, and the ridicule of Molière as Vadius in Femmes Savantes. His Dictionnaire Épynomique de la langue française (1659; 1670, 1714, 1721, 2 vols, 1750), and his Origine della Lingua Italiana (1669), are erudite works, but contain many fanciful etymologies. He died in 1692. See Life by Bartet (Paris, 1859).

Menai Strait, a channel between Carnarvon- shire and the island of Anglesey, running east-north-east from its southern extremity to Bangor, a distance of 14 miles, where it widens out into Beaumaris Bay. Its width varies from about 200 yards to 2 miles, whilst the scenery on both sides is very picturesque. The navigation is hazardous, but for the sake of Canada, under 100 tons, and occasionally some of larger size, pass through the strait. At its entrance the tides sometimes rise to a height of 30 feet; ordinary neap tides, however, do not rise more than from 12 to 15 feet. Communication between the mainland and Anglesey was formerly solely maintained by ferry-boats at different points, but since 1825 access has been afforded by a suspension bridge, and since 1850 by the Britannia Bridge. See BRIDGE.

Mencan. See Siam.

Menander, the most famous Greek poet of the New Comedy, was born at Athens in 342 B.C., and was drowned at the Pyrene in 291. He was the friend, if not the pupil, of Theophrastus, himself a disciple of Plato and Aristotle; and he was the intimate of Epieicus, and the favourite of Demetrius Phalereus and Ptolemy the son of Lagus. His comedies seem to have been more successful with cultured than with popular audiences, for we are told that only eight out of a hundred comedies gained the prize. Unhappily they are lost, and only fragments of his work, but we may safely take our estimate of the 'numinos Menander' from his close copyist and imitator, Terence, and from the words of such writers as Ovid, Propertius, and Lucan. The New Comedy is essentially a domestic rather than political in character, and its chief figures are conveniently summed up in the lines of Ovid:

Dum fallax servus, durus pater, improba lena
Vivet, dum meretriciens blandia, Menandros erit.

His most famous comedy seems to have been the Thaïs, and it is interesting that of the five lines preserved one is quoted by St Paul (1 Cor. xv. 30).

Of the Georgos, litho-er, known by but five small fragments, Professor NICOL published 87 lines, newly recovered, in 1897. See the edition of the Georgos by Granfell and Hunt (1898).

Menchikov. See Menschikoff.

Mencius, the Latin form of Meng-tse, the name of a Chinese sage, a contemporary of Plato and Aristotle, who was born in the province of Shantung, where he died in B.C. 280. It was his mother—the pattern of all mothers ever since in the eyes of the Chinese—and founded a school on the model of that of his great predecessor Confucius, for whom Mencius entertained a feeling of reverent admiration. When forty years of age he led out his disciples and travelled from one princely court to another during more than twenty years, seeking a ruler who would put into practice his system of social and political order. But, finding none, he again withdrew into retirement, and died in 280 B.C. After his death his disciples collected his conversations and exhortations, and published them as the Book of Meng-tse. The aim of Mencius' teaching was essentially practical: how men, especially the rulers of men, shall best regulate their conduct, both public and private. The philosophic root of his system is belief in the ethical goodness of man's nature, which quality he takes to be the essential characteristic of the humanity of men. From this root grow the cardinal virtues of benevolence, righteousness, propriety, wisdom, and power. For it should be the object of the individual to perfect himself by practising these virtues in all the relations of his social and political life. The flowering of this goodly plant which Mencius planted for the ordering of the lives of men, both individual and collective, assumed the form of a liberal and enlightened system of political economy. Amongst other things he advocated freedom of
MENDELSOHN

businesses, encouragement of markets, maintenance of good roads and bridges, &c., condemnation of war, care for the poor and neglected, but above all the provision of education by some means, so that the being that the welfare of the people should be the chief consideration of the state. There is also an aristocratic element in his teaching. The highest types of individual character are exhibited by the scholar, the great man, the superior man or sage, and in this respect he surpassed all his contemporaries; he is the best educator the people can have. The fruits of Mencius' teaching have always been highly valued by his countrymen from his own time to the present. 'The chief dictum of modern Chinese ethics and politics are mostly taken literally from Mencius, or adhere closely to his teaching.'

See Legge, Life and Works of Mencius (1873; 'Chinese Classics' series); and Faber, Mind of Mencius (Eng. trans. 1882).

Mende, capital of the French department of Lozere, is a valley surronded by high hills, 60 miles N.W. of Nimes, has a cathedral, and manufactures serge and coarse cloths. Pop. 7,470.

Mendel, See Mendeans.

Mendeleff, Dmitri Ivanovitch, chemist, was born at Tobolsk, 7th February 1834, studied at St Petersburg, and, after having taught at Smirnopol, Odessa, and St Petersburg, became professor of Chemistry in the university of St Petersburg in 1866. He has enriched every section of chemical science, but is especially distinguished for his contributions to physical chemistry and chemical philosophy. See ATOMIC THEORY; and Nature (vol. xi. 1889).

Mendelssohn, Moses, philosopher, was born 6th September 1729, at Dessau. From his father, whose name was Mendel, a Jewish schoolmaster and scribe, he received his first education; and in his thirteenth year he proceeded to Berlin, where, amid very indigent circumstances, he contrived to learn Latin and modern languages, and to apply himself to the study of philosophy, into which early resolution led him. In the course of the education he had initiated him already. After many years of comparative poverty he became the partner of a rich silk-manufacturer, whose children he had educated. The intimate friend of men like Lessing, Sinzer, Nicolai, he, directly and indirectly, contributed in a vast degree to the abolition of the disgraceful laws and brutal prejudices against the Jews. On the other hand, he acted in the most beneficial manner on his own co-religionists, by rousing them from the mental apathy with which they regarded in his day, that had not a distinct reference to religion, and by waging fierce war against their own religion and other prejudices. He died 4th January 1786, and Ramler wrote the following epitaph on him: 'True to the religion of his forefathers, also as Socrates, teaching immor-

talities and moralities, mister, you saw the prototype of Lessing's Nathan, and was called a 'second Moses.' He was a diligent student of Locke, Shaftesbury, and Pope: a zealous defender of enlightened Monotheism, and, in spite of Lessing, strongly anti-Spinozist. His principal works are a voluminous history of Philo, and along with Lessing, a History of the Jews, the Sensations (1755), on the Sensations (1755), on Evidence in Metaphysics (1763); Phaedon (1767), a dialogue on the immortality of the soul in the manner of Plato; Jerusalem (1783), a defence of Judaism as a reli-
gion; and essays in refutation of Pan-
themism and Spinozism. His works were edited in 1845 (8 vols.), and again in 1889 (2 vols.). See also Life by Kayserling (2d ed. 1887).

Mendelssohn-Bartholdy, Felix, composer, was born at Hamburg on February 3, 1809. The family name was already remarkable by the fame of his grandfather, Moses Mendelssohn. Abraham, the second son of Moses Mendelssohn, had entered banking business in Potsdam, but resided mainly on his marriage with Lea Salomon in 1804, settled in Hamburg. The French occupation in 1811 forced him to escape with his family to Berlin, where he founded the eminent firm of bankers known by his name. He resolved about this time to convert his sons to Protestant Christianity, and added the name of Bartholdy to that of Mendelssohn in order to distinguish his own from the Jewish branch of the family.

The education he bestowed on Felix appears to have been as liberal as it was systematic. In his eighth year we find the child studying composition under Zelter and the pianoforte under Ludwig Berger, besides receiving lessons in drawing and the violin. Two years later he made his first public appearance, playing the pianoforte part in a trio at a concert in Berlin. With 1820 began that period of prolific production which lasted almost till his death. At the same time he entered upon a ceaseless round of gaiety and activity which largely determined his character. The home-life of the Mendelssohn family was no less intimate than the musical life he led as a boy. A concert was given at the house on alternate Sunday mornings, when some of Felix's compositions generally found a place in the programme. Within the next few years he formed the acquaintance of such men as Goethe, Weber, and Moscheles, and had composed his Symphony in B minor and the Shorter Symphony in C minor. In 1825 he undertook to arrange for publication the Shorter Symphony, which had been given to him by his father, and which his son arranged in a second form and brought out in 1826. He went to Paris to study at the Conservatory, and at the same time began to sketch a song-cycle on Goethe's Faust. There followed a journey to Italy, where he was introduced to a series of artistic and musical friends. The 'Six Songs from Goethe's Faust' were given to him in 1826, and he proceeded to Turin and Florence. In November 1826 he was back in Berlin, and had arranged the Faust-song cycle and a Scherzo for piano. His next journey was to England, where he arrived in April 1828, and gave his first concert in London in November. The following August saw the completion of his opera, 'Camacho's Wedding,' which was destined to be the beginning of his unpleasant relations with the Berliners; and his well-known Octet for strings was finished in October. With the composition of the Midsummer Night's Dream overture, in August 1829, Mendelssohn may be said to have attained his musical majority, and his concert with Zelter in April 1830. At the same time the wedding of a song-cyle on Goethe's Faust was produced in Berlin. Though received with vehemence applause it never reached a second performance, owing, among other reasons, to the illness of one of the principal singers, and the personal events of the wedding of the song-cyle. Soon after this Mendelssohn commenced the formation of a small choir of sixteen voices, which met at his house for the purpose of studying Bach's Passion Music; and, in spite of the difficulties of the work and the determined opposition of Zelter, the scheme culminated in the famous performance by the Singakademie on March 11, 1829, the first since Bach's death. For some reason, however, his success did not improve his relations with Berlin musicians. Accordingly, being now twenty years old, he resolved to leave home and to visit the different countries of Europe, in search of new lands of his most pleasant associations, was his first destination. He arrived in London on April 21, 1829, and was warmly welcomed by the Philharmonic Society. He made his first appearance at one of their concerts, when he conducted his Oratorio 'Euryanthe.' In the summer inspired him with the Hebrides overture and the Scotch Symphony.

During the next year he visited Munich and Vienna. By October he had reached Venice, and the following winter he spent in Rome. Returning to Munich he proceeded thence to Paris, paying his second visit to London in April 1832. He shortly afterwards returned to Berlin, having been
absent three years. In the spring of 1833 he was invited to conduct the Lower Rhine festival at Dusseldorf, where his success led to his being offered the entire direction of the music for three years. He at once accepted the post and commenced his new duties in September. His work at the theatre, however, proved uncongenial, and was deserted in 1834. His stay at Dusseldorf was full of responsibilities and worries, and he ultimately left the town in October 1835 to conduct the Gewandhaus concerts at Leipzig. A subsequent visit to Frankfort brought him in contact with Rossini, and was also the occasion of his first acquaintance with Cecile Jeanne, who afterwards became his wife. The marriage took place in 1837, and was followed by a visit to Birmingham, where he conducted his St Paul, which had been first heard at Dusseldorf the previous year. His attention was now chiefly devoted to Leipzig, and September 1840 found him acutely anxious and impatient of his duties. In March 1846 he paid his ninth visit to England for the purpose of conducting the Messiah, which took place at Birmingham on August 26. But his hard work was now beginning to tell on him, for, although his London duties and his position as chief of the Leipzig Conservatorium entailed constant labour and anxiety, he persisted in carrying out all his engagements. He had scarcely returned from his tenth and last visit to England, in May 1847, when the news of his sister Fanny's death reached him. Periods of illness followed rapidly on each other, and on November 4, 1847, he expired at his house in Leipzig. The body was conveyed to Berlin, and was interred in the family burial-place in the Old Trinity Churchyard.

In stature Mendelssohn was short, and his countenance was of a decidedly Jewish cast. He was eminent both as pianist and organist, especially in his rendering of the works of Bach, Mozart, and Beethoven. He moreover possessed a remarkable facility of improvisation. His gifts also included a talent for landscape-drawing; and he has left behind him a whole series of sketches illustrating his different journeys. His music dwells almost exclusively on the sunny and gay side of life. Rarely, if ever, does he touch the innermost depths of passion and feeling. But he was, like Handel, one of those few who appealed to English audiences; for forty years his Elijah has been almost as popular as the Messiah itself.

See two collections of Mendelssohn's Letters (1861 and 1863; trans. by Lady Wallace, 1867-69), those to the Moscheles family (1847; trans. by Misses Beulé and F. Alexander and Sir George Grove (1894); the Lives by Benedict (1859), Moscheles (1873; trans. by Coleridge), Lampadius (1886), and Hellmann (34 ed. 1892); Reminiscences by Berrient (1869); trans. by Mrs Macfarren), Hiller (1874); and Hensch, Die Familie Mendelssohn (1879; trans. 1882).

Mendes, Catulph, born at Bordeaux of Jewish parentage 22d May 1841, has since 1850 written a long series of poems, romances, dramas, and libretti, as well as journalistic articles and criticisms on Wagner, &c. Of his novels may be named Le Roy Fugitif (1868), Le Triomphe de la Bergerie (1870), and La Maison de la Vieille (1894).

Mendicancy. In spite of the stringency of the laws against vagrancy and begging, and the numerous aid societies in every town in Britain for the relief of the poor and unemployed, quite an army of men, women, and children wander from place to place, and pick a living in a little of what the better-off and more industrious neighbours. This class is largely recruited from the idle, drunk, and vicious, though there is always a certain percentage who are really the victims of misfortune. Though the law is against begging—English statutes for the repression of mendicancy date from the 14th century—there is no law against giving to beggars. But indiscriminate charity only feeds the evil it seeks to remove, and the work-willed, shiftless population continues to multiply, and the benevolent. The truest charity consists in helping those who help themselves, and those societies and individuals are most useful that aid the fallen to gain work and self-respect, and so rise in the social scale. There are no fewer than 83 societies in Great Britain for the proving of the distressed and tramp labourers, and the number of their branches is in London and 11 in Scotland. The relief given may consist in supplying immediate necessities, helping the poor into hospitals and convalescent homes, to emigrate, or to secure temporary work. Tickets are in some cases supplied to subscribers, which entitle the party to whom they are given to one meal. Tickets for a night's shelter can also be had, to be given instead of money. The Mendicity Society in London (established for the suppression of public begging in 1818), whose work has been much aided by the Charity Organisation Society (see CHARITIES), has arrested some 25,000 vagrants to be convicted as impostors, and relieves some 15,000 or 14,000 cases in a year. A police census of December 25, 1888, credited Edinburgh, in a population of a little over a quarter of a million, with 1,886 common labourers and tramps of whom 602 were Scotch, 210 Irish, 83 English, and 16 foreigners. In London it is calculated that one in thirty of the inhabitants live on charity; in Paris, where there is a well-organised syndicate of professional mendicants, one in eighteen (see Chambers's Journal, 1890). Mr Bock observed: there were 3,000,000 persons in England who could not live for a week on their own resources, including 100,000 homeless waifs, sleeping on or under bridges, and gaudierews, carts, &c., and for them he devised the scheme of rescue propounded in his In darkest England (1890). See also POOR-LAWS, VAGRANTS.

Mendicant Orders, certain religious associations in the Roman Church, which, carrying out the principle of religious poverty and self-humiliation of its founder, make it part of their profession to devote themselves to serving the poor, either real or personal, and to subsist upon alms. In the mendicant orders alms were commonly collected by the lay-brothers; in some, by actual solicitation; in others, by the ringing of the convent bell when the stock was exhausted. See the articles DOMINICANS, FRANCISCANS, CARMELITES, AUGUSTINIANS; also PRIEST.

Mendip Hills, a range in Somersetshire, extending 23 miles south-eastward from Weston-super-Mare to Shepton Mallet, and 3 to 6 miles in breadth. The highest point is Black Down (1067 feet). The limestone of the Mendips is pierced by numerous caverns, some of which have yielded prehistoric
remains; and lead-mining, now much decreased in importance, has been carried on from pre-Roman days, calamine-mining being a later industry.

**Mendoza**, a western department of the Argentine Republic, with an area of 55,000 sq. m., and a pop. (1895) of 114,814. The Andes occupy the western portion: Aconcagua (22,427 feet), the highest peak in America, is on the north-west front. Mendoza has a population of 14,000 inhabitants, and a large quantity of wine is exported to the other provinces.—The capital, Mendoza, 650 miles by rail W. by N. of Buenos Ayres, is on the transcontinental railway, which reached this point in 1884. It is a handsome town, lying among vineyards and gardens, 2230 feet above the sea; its streets have shade-trees and streams of running water, and the Alameda is the most beautiful on the continent. An active trade is carried on with Chili. An earthquake in 1861 destroyed Mendoza (founded 1550) of its 26,000 inhabitants; many of the ruins are still visible in the larger city which has been raised on its site. Pop. 20,000.

**Mendoza**, the name of an illustrious family that throughout Spanish history distinguished itself wherever distinction was to be won, in war, statesmanship, diplomacy, the church, and literature. A descendant of the Cid has been claimed for it; but it was of Basque origin, and its progenitors the lords of Rubi, some centuries before the Cid's time. Of its more notable members the first is Diego Lopez de Mendoza, created Marquis of Santillana by John II. of Castile in 1445 for his services on the field of Omaco and elsewhere. Besides being a gallant soldier, he was a wise statesman and a sturdy patriot, and in himself a proof of the truth of his own saying, that 'the lance never blunted the pen, nor the pen the lance.' For among the poets he stood next to Juan de Mena, and his exquisite little song of the 'Vespaera de la Flor,' though a learned work, is a jewel in the diadem of Spanish anthology. He served literature, moreover, by leaving an excellent account of the Provencal, Catalan, and Valencian poets, and he has a further claim to remembrance as the first of folklorists and the first collector of popular proverbs 'such as the old woman recites,' the title of one of his works. Among the most famous of his six sons was Pedro, Archbishop of Toledo, commonly called 'The Grand Cardinal,' who for many years was the trusted prime-minister of Ferdinand and Isabella, a man whose integrity and nobleness of character, no less than his commanding abilities, made him a prominent figure in an age by no means poor in great men.

The best known of the name is the marquis's great-grandson, Diego Hurtado de Mendoza (1593-1673), the strong-handed lieutenant to whom Claveria referred, as the terror of his Italian policy and the representation of his views at the Council of Trent. He inherited a full measure of his great-grandfather's gifts as a statesman and as a man of letters. Almost as much as his kinsman Garciellos de la Vega and Juan Bescan he was interested in the literary history of Spain, and in matters of Spanish stem, but as a poet he was more national than either of his allies. His largest work is his *War of Granada*, a history of the revolt of the Moriscos in 1568-70 against the oppression of Philip II, written in Latin, but a masterpiece of Spanish prose, marked throughout by rare narrative power, and by a generous spirit towards the miserable Moriscos which is rarer still. Greater glory yet would surround his name if his right to the little tale of Lazarrillo de Tormes could be proved, but his title, it must be confessed, is not quite clearly made out. We have, it is true, the positive assertion of the Flemish scholar André, in his early Spanish praxis (1530), and we must suppose he had evidence that satisfied him, but what it was we know not. Beyond this there is nothing but the consensus of opinion in Spain, the fact that there is no other claimant (for inexorable dates disprove of Ortega's claim), and a certain amount of circumstantial evidence, which, however, partly rests upon the probable but not yet proved existence of a first edition printed at Antwerp in 1533. The silence of Mendoza's family and early editors is, however, no argument against his authorship, but rather the contrary. That he was a man of letters, and that he had a book full of Reformation ideas is not strange, but it is strange that they should not have denied, if they could, his reported connection with it.

**Menéndez**, in ancient Greek heroic history, was king of Lacedemon, the younger brother of Agamemnon, and husband of the famous Helen (q.v.).

**Menex**, one of the subdivisions of the Cambrian System (q.v.).

**Meneses**, Antonio RAPHAEL, artist and writer on art, was born at Aussig, in Bohemia, March 12, 1728. His father, Israel Mengs, was himself a painter, and from him young Raphael received his first instructions in art. At the age of thirteen he went to Rome, where he remained three years. On his return to Dresden, in 1744, he was appointed court-painter to the king of Poland and Saxony, but was not prevented from living at Rome, where he became a Catholic and married. In 1754 he became director of the school of painting of the Capitol. After three years he visited Spain. To this period belongs his most celebrated effort, it represents the Apotheosis of the Emperor Trajan, and is executed on the dome of the grand salon in the royal palace at Madrid. He returned again to Rome in 1776, where he died 29th June 1770. He was a learned and scholarly painter, but his works, though not very numerous, seldom exhibit more than a correct and cultivated taste. His writings were edited in 1780.

**Menzies**. See MENGUS.

**Menhadon** (Clypea menhadon), the name, especially in Massachusetts and Rhode Island, of a species of herring or shad, abundant off the eastern coast of the United States. Other local names are Whitefish, and Hardhead (in Maine), Bony Fish and Mosshunker (in New York). It is much used for bait and is very rich in oil, while the refuse furnishes valuable manure. Economically it is one of the most important North American fishes. See C. G. Goodell's *Natural History of the Menhadon* (Washington, 1872).

**Menhir**. See Standing Stones.

**Méner**, Émile Justin, French manufacturer and writer, was born at Paris on 18th May 1826, and died at Noisiel-sur-Marne, 17th February 1881. He established at Noisiel the celebrated chocolate factory, with a branch in London, chemical works at Marseilles, a brick works at Alès, and a confectionery, and in Nicaragua a cocoa plantation. A warm advocate of free trade, he expounded his views in *Économie Rurale* (1875), *L'Arbre Economique* (2 vols. 1875-79), &c.

**Menin**, a town of West Flanders, Belgium, 7 miles by rail SW. of Courtrai, stands on the left bank of the Lys, which separates it from France. It was fortified by Vauban, but its works have been demolished. Pop. (1890) 14,116.
MENNGITIS

MENONITES

Meningitis (Gr. meninx, 'a membrane') is the term applied in medicine to designate inflammation of the membranes investing the brain and spinal cord, of which in this relation the innermost—the pia-mater—is the most important. Far the most frequent form of meninngitis in Britain is the tubercular, already described under Hydrocephalus (q.v.). Other forms of meningitis, in which symptoms are similar, is unnecessary to repeat them here.

Epidemic cerebro-spinal meningitis, or Cerebro-
spinal fever.—Outbreaks have occurred from time to time during the 19th century in the northern hemisphere, less frequently in the British Islands than in the United States, but in several continental countries observers are found of an epidemic disease affecting chiefly the membranes of the brain and cord. It usually begins suddenly with fever and violent headache; vomiting, glindingness, stupor, delirium, and other nervous symptoms succeed, the most inimicve of which is a general rigidity of the muscles of the neck and back. The disease is extremely variable in severity; sometimes it is fatal in less than twenty-four hours; sometimes so slight as to only confine the patient to bed for a week or two. But the fact remains that these extremely variable improvement in favourable cases beginning after a week or two. Convalescence is often very slow. It occurs chiefly in children and young adults. It is not clearly distinguishable from other forms of meningitis except by its mode of occurrence, generally in a somewhat localised and limited outbreaks. If contagious, it is only feebly so. Treatment must be conducted on general principles, as no specific is yet known.

Simple meningitis (i.e. not traceable to tubercle or to the epidemic form) is most often caused by injury, but may result from disease of the skull, pyaemia, and other diseases, and has even been caused by excessive exposure of the head to the sun. It usually begins, unlike the tubercular form, quite suddenly; and it too is an extremely fatal disease. But the outlook is not quite so hopeless in simple meningitis; and exceptions which appear desperate do sometimes recover. The essentials of treatment are rest and quiet in a darkened room, and little food of the lightest kind. See to the head, blistering, blood-letting, local or general, and free purging sometimes seem beneficial.

Meningocoele. See ENCEPHALOCOELE.

Menippus, a satirist who lived in the first half of the 3rd century B.C. He was born in Thrace, and became a Cynic philosopher. His works in Greek have perished, and he is known only through the imitations of Marcus Terentius Varro (q.v.), whose own fragments bear the title of Menippica Satyr. The name was adopted as title for a famous French collection of poetical satires in prose and verse, the Satire Menippée, which appeared in 1594 at the crucial period of the League.

Mennonites, a Protestant sect, combining some of the distinctive characteristics of the Baptists and the Quakers. Their principal tenet is the administration of baptism only upon genuine faith, and not upon baptism of children, or not on baptism infants. They attach more importance to the ordering of the Christian life than to doctrinal points, ranking discipline and restitute of life before learning and the scientific elaboration of dogmas. They refuse to take oaths, to bear arms, condone every kind of revenge and divorce (except for adultery), and object to fill civic and state offices, holding all kinds of magistracy to be necessary for the present, but foreign to the kingdom of Christ. The church is the community of the saints, which must be kept pure by strict discipline. Grace they hold to be designed for all, and their views of the Lord's Supper fall in with those of Zwingli; in its celebration the rite of foot-washing is Ostensibly and, for congregational purposes. They have bishops, preachers, and deacons. The first congregation to profess these principles was formed at Zurich in 1523 by three men, Grebel, Manz, and Blaurock. Thence the sect spread rapidly through Switzerland and the south of Germany. In Western Europe, especially in South America, in Sweden, in North America, and in Russia, it has the greatest strength at St Gall, Augsburg, and Strasbourg. But a bitter persecution, in which 3000 persons perished, caused many to move into Moravia and into Holland. Contemporaneously with the formation of the Zurich congregation and the first settlements, there was an appearance in Westphalia of the Anabaptists (q.v.), a sect professing some similar views, but guilty of most reprehensible fanatical excesses, in which the Swiss party had no share and with which they showed no sympathy. After the fanatical party had been suppressed, with much shedding of blood, in Münster, there arose a man of sound piety and great moderation, Menno Simons (1492-1559), who denounced the blasphemous zealots of Westphalia, and organised the scattered members of the Mennonite church and congregations throughout Holland and north Germany. His influence became so paramount that his name has been used ever since to designate the sect as a religious body. Dissents broke out amongst them at a later time both in Switzerland and in the United Provinces, but that the name of Mennonites for Baptist Communities. The advocates for greater strictness showed much want of cohesion, the various parties being known by such titles as Old Flemings, Uekevalists, Dompelers, Jan Jacob Christians, Apostoolites, Galenists, &c. All the Dutch Mennonites were, however, reunited in 1801. At the present time they number about 32,000, divided among more than 100 congregations. The German and Swiss Mennonites probably number nearly 20,000. In Brazil they number about 5000. The colonies of German Mennonites into South Russia; others joined them after 1867. But in 1871—at which time they numbered close upon 40,000—the Russian emperor decreed that they should be liable to conscription for the army, and should be deprived of certain privileges of their rank as aliens. This caused many of them to emigrate to the United States, where they settled principally in Minnesota and Kansas; others have proceeded of late years to Brazil. But Mennonite refugees from Alsace, the Palatinate, and Holland have already reached America as early as 1863, in which year the first Mennonite church in the States was organised at Germantown in Pennsylvania. At the present time there are about 100,000 professing this form of religious life in the United States and Canada. The most numerous of their groups are divided as Old Mennonites, Reformed Mennonites or Herr's People, New Mennonites, Evangelical Mennonites, and Amish or Ohio Mennonites, also known as Hookers and as Buttonhite. Nearly all the Mennonites are farmers, and are famous for culture, integrity, and philanthropic enlightenment they stand everywhere high in the regards of their neighbours.

See Blouet ten Cate, Geschichte der Doopsgezinde (5 vols. 1839-47); J. A. Starck, Geschichte der Taufe und der Taufgemeinden (1798); N. Browne's Life of Menno Simons (1833); [Mrs Brown] Our Ancestors, their Manners, and the Schicksale der Taufgenossen (1884); and Hop Schefer
Menopause or Hell-bender (*Protonotus horrida*). — The salamander in form, has four well-developed limbs, and a persistent gill-aperture. It attains a length of 18 inches to 2 feet, and has extraordinary powers of voracity and vitality.

Menschikoff, Alexander Danilowitch, a Russian fieldmarshal and minister of state, was born at Moscow, 16th November 1762. Lefort, the favourite of Peter the Great, saw him selling tarts in the street, took him into his own service, and introduced him to the notice of his imperial master. Rising rapidly in the Czar's favour, he distinguished himself at the siege of Azov, and afterwards accompanied Peter in his travels to Holland and England. On the death of Lefort (1709) he was made chief favourite. During the years (1709-13) of the war with Sweden he played important parts at the siege of Schliisselburg, the battles of Kulisch and Pultowa—on the field of Pultowa Peter made him field-marshal—the capture of Riga, in the occupation of Courland and Pomerania, and at the capture of Stettin. At the capture of Marienburg the woman who afterwards became the wife of Peter, Catharine I., fell into Menschikoff's hands, and was through him introduced to the czar. Towards the end of Peter's reign Menschikoff lost favour owing to his exertions and suspected duplicities. But when Peter died he secured the succession of Catharine, and during her reign and that of her successor, her youthful grandson, Peter II., he governed Russia with almost absolute authority. His ambitions schemes—he was about to marry his daughter to the young czar—and the dislike of the old nobility led to his overthrow by the Dolgorouki, who banished him to Siberia (September 1727) and confiscated his immense estates and treasures. He died 21 November 1729.—His great-grandson, Alexander Serovich Menschikoff, was born in 1789. He served in the campaigns of 1812-15, and rose to the rank of general. In the Turkish campaign of 1828 he took Anapa after a short siege, but before Varna received so severe a wound as compelled his retirement. After his recovery he was made head of the Russian navy, which he raised to a high state of efficiency. In March 1853 he was sent as ambassador to Constantinople, whose overbearing behaviour produced a speedy rupture between the Porte and the czar, and brought about the Crimean war. In this war he commanded at the battles of Alma and Inkermann, and displayed great energy in defending Sebastopol; but in 1855 he was recalled because of a severe attack of illness. Menschikoff was till his death on 2d May 1869 one of the most prominent members of the old Russian party.

Menstruation is the term applied to the discharge of blood which issues every month from the generative organs of the human female during the period in which she is capable of procreation. The first appearance of menstruation, or the discharge of the term *menstrual* or *catamenial*, is said to occur about the eighteenth year of life. Among men these symptoms invariably accompany the discharge. As a general rule there is no menstrual flow during pregnancy and lactation, and its cessation is one of the first signs that conception has taken place. Anomalies and disturbances (presumption, undue copiousness, &c.) of the menstrual discharge are a frequent cause or symptom of illness.

Mensuration, the name of that branch of the application of arithmetic to geometry which teaches, from the actual measurement of certain lines of a figure, how to find, by calculation, the length of other lines, the area of surfaces, and the volume of solids. The determination of lines is, however, generally treated of under Trigonometry (q.v.), and surfaces and solids are now understood to form the sole subjects of mensuration. To find the length of a line (except in cases where the length can be calculated from other known lines, as in trigonometry) we have to apply the unit of length (in the shape of a footrule, a yard measure, a chain), and discover by actual trial how many units the line contains. But in measuring a surface or a solid we do not require to apply an actual square yard, or square mile, or square block, or square feet, or such squares or blocks; we have only to measure certain of its boundary lines or dimensions; and from them we can calculate or infer the contents. For example, to find the area of a rectangle it is sufficient to measure two adjacent sides and find the product of these in terms of the unit of length chosen: 7 feet × 3 feet = 21 square feet.

The areas of other figures are found from this, by the aid of certain relations or properties of those figures demonstrated by pure geometry: for instance, the area of a parallelogram is the same as the area of a rectangle having the same base and altitude, and is therefore equal to the base multiplied by the height. As a triangle is half of a parallelogram, the rule for its area can be at once deduced. Irregular quadrilaterals and polygons may be measured by dividing other irregular shapes into triangles and determining the area of each of which is separately calculated. For the area of the circle, see Circle. The volume of a rectangular parallelopiped is found in cubic inches by multiplying together the length, breadth, and depth in inches; and the oblique parallelopiped, by multiplying the area of the base by the height.

Mentana, a small village 12 miles NE. of Rome, where, 3d November 1807, the Garibaldians were defeated by the papal and French troops.
Menteith, Lake of, a beautiful sheet of water in south-western Scotland, 17 miles W. by N. of Stirling. Lying 55 feet above sea-level, it has an utmost length and breadth of 1/2 and 1 mile, and a depth in places of 80 feet. It sends off Goodlie Water 9 miles east-south-eastward to the Forth, and contains three islands—Inchmahome, Inchtalla, and Dog Isle. Inchmahome has remains of an Augustinian priory (1238), the refuge in 1547-48 of the child-queen Mary Stuart before her removal to France; whilst on Inchtalla is the ruined tower (1247) of the Earls of Menteith. That title was borne by a Celtic line in the 12th century, and after the accession of Stewart, Sorn, Strathearn, and Graham (1427-1694). See Dr John Brown's Horse Sub-sevice (1858), and Sir W. Fraser's Red Book of Menteith (2 vols. Elin. 1880).

Menthol is a camphor obtained from oil of peppermint by cooling. It has been used by the Japanese for 200 years and is known by them as Hekka-no-Hari; but native Gentlemen always went about till recently with a medicine-box containing this drug. The chief source is the Mentha arvensis purpurascens, the oil of which yields more menthol than that of peppermint. In many nervous affections, such as neuritis, toxaemia, headache, &c., menthol in the form of ointment often gives instant relief. When the cone is rubbed on the skin, a twofold action results. The menthol rapidly evaporates, giving a sensation of cold; but if evaporation be prevented it acts as a rubefacient, producing a feeling of warmth. Menthol has also antiseptic properties, and is used with success in solutions in diethyl-therap., &c. It has an odour resembling but differing from that of oil of peppermint. It is liable to be adulterated with thymol, eucalyptol, &c., and then is often irritating to the skin.

Menton (Fr. Menton), a town in the department of Alpes Maritimes, France, is pleasantly situated on the Mediterranean, 14 miles from the Italian frontier and 14 miles by rail NE. of Nice. Owing to its southern exposure, and the fact that spurs of the Alps shelter it on the north and west, it enjoys a beautiful climate—average for the year 60° and it has become a favourite watering-place for invalids from all quarters from England, Germany, and other countries. The town stands on a promontory that divides its bay into two portions; the native town clings to the mountain side, whilst the hotels and villas for the visitors extend along the beach. Menton, which is protected on the south and west by a sea-wall (1880). There is a trade chiefly in olive-oil, wine, lemons, skins, which fluctuates between £75,000 and £211,000 a year. Great damage was done to the place by an earthquake in February 1887. Pop. 8,433. In the 14th century it was purchased by the lords of Monaco, and, except during the period of the revolution and down to 1815, when France seized it, the princes of Monaco kept possession till 1848. In that year the inhabitants voluntarily put themselves under the protection of Savoy, but in 1860 after the fall of Napoleon the town passed to France twelve years later. See Dr Bennet, Winter and Spring on the Shores of the Mediterranean (5th ed. 1874) and Maritime Alps and their Seacoast (1888).

Mentor, the son of Alcims, and trusted friend of Ulysses, who, on setting out for Troy, left him the Iliad, which the young Telemachus was educated, and his name has become a synonym for an instructor and guide.

Menu. See MANU.

Menura. See LYRE-BIRD.

Menzaleh, Lake, a coast lagoon of Egypt, extending east from the Danietta branch of the Nile, is separated from the Mediterranean by a narrow strip of land, with several openings. Its surface, 460 sq. m., in extent, is studded with islands, the most interesting of which is Tenenes, the ancient Tennesus, with Roman remains of baths, tombs, &c. Its waters are full of fish, and its shores abound in wild-fowl. The Suez Canal passes through the channel formed by the lake; the average depth of not more than 3 feet, except when the Nile, mouths of whose delta reach it, is in flood; and it is being gradually drained.

Menzel, AdOLF, painter, lithographer, illustrator, and engraver, was born 8th December 1815, at Breslau, and is best known for his drawings and water-colours, which were an immediate success. The Great and William I., emperor—pictures characterised by historical fidelity, strong realistic conception, originality, and humour. His 'Adam and Eve,' 'Christ among the Doctor's,' and 'Christ expelling the Money-changers' are also notable pictures. See also by him the critical works of J. Werner (1873), and the critical work of Jordan and Dohme (1885 et seq.)

Menzel, WOLFGANG, an eminent German author, was the son of a medical practitioner, and was born at Walsenburg, in Silesia, 21st June 1798. He studied at Jena and Bonn, and was for four years schoolmaster at Aaran in Switzerland, and in 1832-33 returned to Germany. He is known in the literary world by his witty Strecker's (1823). He subsequently lived mainly in Stuttgart, where he died 23d April 1873. He edited and contributed to literary magazines, and wrote a very large number of works—poetry, romances, and historical, literary criticism, political polemics, and Christian theology. The most important were a history of Germany (1826; Eng. trans. 1848), German literature (1827; Eng. trans. 1849), German poetry (1838), of Europe (1833-57), and of the world (Allgemeine Weltbeschichten, 16 vols. 1862-72), on Frussia's place in Germany (1866 and 1870), mythological researches (1842), the pre-Christian doctrine of immortality (1869), and autobiographical Denkwürdigkeiten (1876). He was almost constantly involved in controversy, attacking with equal zeal theological rationalists and political radicals, all whose tendencies seemed 'dangerous' to the Christian religion or the German monarchies, such as the 'Young German party' after 1830. Börne (q.v.) retaliated in the Franzosenfresser ('Frenchman-eater').

Mephistopheles, the name of one of the best-known persons in the mythology of the principle of evil. The word has been very variously explained, but is probably of Hebrew origin, like most names of devils in the history of magic, confounded with, and approximated in form to, the Greek μηστοφελας, 'one who loves not light.' Mephistopheles owes all his modern vitality to Goethe's Faust (q.v.).

Meppel, a town in the Netherlands province of Drenthe, 18 miles N. by E. of Zwolle, has a trade in butter and linen manufactures. Pop. 8,148.

Mequinez. See MIKNAS.

Meran, a town of Austria, in Tyrol, at the south side of the Alps, 100 miles by rail S. by W. of Innsbruck, is a celebrated winter-resort, especially for the invalids from England. In May 1216, the 15th-century castle, a 14th-century Gothic church, an English girls' school, &c. Pop. 7,334, more than doubled in the season. See Fraser Rae's Austrian Health-resorts (1883).
MERCANTILE LAW

more noteworthy are L’Apoteosi d’Ercule (1819), Amaranto (1820), Elia e Claudio (1821), Donna Carita (1820), I Briganti (1836), II Governatore (1837), and La Feste (1842). From 1827 to 1831 he was in Spain; in 1833 he was appointed musical director for greater cathedral at Novara, and in 1840 of the conservatory of music at Naples. He died in that city, 17th December 1870—blind since 1861.

Mercantile Law, the branch of municipal law which is similar, and in many respects identical, in all the trading countries of the world. An understanding of it is earliest established in the department of maritime law, that British merchants began with such codes as the Consolado del Mercantile law is dealt with in this work under a large number of heads, as

MERCANTILE SYSTEM, that system in political economy which regards it as a government’s chief end to secure a favourable balance of trade—toget the country to import as little as possible of the produce of other countries, and export as much as possible of its own, so that more money is received than is paid away. The policy of the Emperor Charles V. was regulated by this aim, as that of Henry VIII., and Queen Elizabeth; and the Navigli, and the Grand Vasa (q.v.)—the fame of which the English emigrants of the sea. Colbert (q.v.) was regarded as the most systematic mercantilist. Among English exponents of the system were Sir Josiah Child and Sir William Temple. See BALANCE OF TRADE, POLITICAL ECONOMY.

Mercator (the Latinised form of KREMER), a Flemish mathematician and geographer of German extraction (1512–92). See MAP.

Mercedes, in Argentina, (1) a city 61 miles by rail W. of Buenos Ayres, with a free library and hospital, soap-factories and steam-mills, and 8000 inhabitants (many Irish); and (2) a town 55 miles by rail ESE. of San Luis city, with 6900 inhabitants. (3) Mercedes is also the name of the capital (4000) of Santa Elena province, in Uruguay.

Mercenaries, or STIPENDIARIES, men who received pay for their services as soldiers, especially as distinguished from the feudal and general levies, owing military service to the crown. Such men were often foreigners, and the name has come to mean only foreign auxiliaries. Hired professional soldiers appear very early in the history of military organisation (see ARMY). Foreign mercenaries appear in the armies of Alexander the Great and the Romans. They were common in all armies, but generally engaged for a single campaign only. In England, Harold had a body of Danes in his army when he defeated the Norwegian king—the vikings, a body originally established by Canute. William III. had for some time a body of Dutch troops in his pay after he became king of England; and throughout the 18th century Hessian and Hanoverian regiments were constantly in the pay of the British government for temporary purposes. Hessian and Hanoverian regiments were not only in the American war; and the Landgrave of Hesse, who sold his troops at so much a head, received upwards of half a million for soldiers lost in that campaign.

During the Irish rebellion, again, in 1798, many Hessian troops were employed.

On the outbreak of the continental war in 1793 it was determined to increase the British army by the addition of a large body of foreigners; and accordingly in 1794 an act was passed for the embassad of the 'King’s German Legion,' consisting of 15,000 men. These troops, who were increased in the course of the war to nearly double that number, distinguished themselves in various engagements of tremendous magnitude. It was common during the Peninsular war to enlist deserters and prisoners of war into the British army, but such recruits were not reliable when opposed to their fellow-countrymen. Corps of French émigrés, as the Chasseurs Britanniques, which served through the Peninsular war, and in America, the York Chasseurs, in which some Turks were enrolled when at Malta, and others, were also organised. The whole of the foreign legions were disbanded in 1815, the officers being placed on half-pay.

During the Russian war in 1854 the British government again had recourse to the enlistment of foreigners. The numbers authorised were 10,000 Germans, 5000 Swiss, and 5000 Italians, with the same pay as British troops. About half were enrolled, and had become very efficient, when hostilities had ceased, and they were discharged with great cost for gratuities, &c. Foreigners may enlist into the British army, but the Army Act of 1851 provides that the proportion of aliens in any corps at one time shall not exceed one to every fifty British subjects, except in the case of negroes and persons of African blood, and then only at a battle, or ships, and occasionally these officers obtained distinction and fame. But the privates returned home poor and often demoralised; and the cantons which supplied most mercenaries suffered severely by their absence. After the French Revolution the cantons ceased publicly to hire out their subjects; and after 1830 most of the cantons forbade foreign enlistment. In 1859 the Confederacy passed a severe law against recruitment for service abroad. There is still, however, a large contingent of Swiss mercenaries in the Dutch East Indian Colonies. The Papal State publicly and thus often a body of guard of about 100 men. See CONDOTTIERI, FREELANCERS.

Merchandise Marks. See TRADE MARKS.

Merchant Taylors’ School. This great London day-school, with 500 boys in 1890, was founded, and is still governed, solely by the master, wardens, and company of Merchant Taylors. The first school-house was built in 1591 in Suffolk Lane. This building was destroyed in the great fire of 1666, but restored in 1684 on the same site. When the Charterhouse School was removed into the country, the Merchant Taylors bought land from the governors of the Charterhouse for
MERCIA

MERCURY

£20,000, and in 1873–74 erected, at a cost of £30,000, their present school-house on the site of the old gawn boys' quarters of the Charterhouse. Richard Mulcaster was the first master of the school, and among its scholars have been Edmund Spenser, Bishop Andrews, James Shirley, Archbishops of York, Dukes of Cambridge, Chester, Oxford, and Sir Henry Ellis. See the Rev. C. J. Robinson's Register of The Scholars admitted to Merchant Taylor's, 1562–1873 (2 vols. 1882–83).

Mercia, the great Anglo-Saxon kingdom of central England. The name, originally limited to the district around Tamworth and Liechfield and the Upper Trent Valley ('mercat land'), was afterwards extended to all that had to be defended against hostile Welshmen and Saxons. The first selections were mostly probably made in the second half of the 6th century, but Mercia first rose into real importance, and indeed grew into Middle England, under the vigorous rule of Penda (629–653). His nephew, Wulfhere (639–677), pushed back the Northumbrians, and extended the boundary southward to the Thames, and Ethelbald (716–756) spread his conquests round all the neighbouring states. But the mightiest kings of Mercia were Offa (757–795) and canoe (789–806), both of whom powerfully declined before the invasions of the Dunes on the one side, and the spread of the West Saxons kingdom on the other. At length it became one of the great earldoms, and Elfgar, Leofric, Edwin, and Morcar retained at least the shadow of past power. See England (History); also DIALECT.

Mercury. See HERMES, PLANETS.

Mercury, or Quicksilver (sym. Hg; atomic weight = 200; sp. gr. 13, 346); one of the so-called noble metals, remarkable as being the only metal that is fluid at ordinary temperatures. It is of a silvery white colour, with a striking metallic lustre. When pure it runs in small spherical drops over smooth surfaces; but when not perfectly pure the drops assume an elongated or twisted form, and often leave a grey stain on the surface of glass or porcelain. Moreover, the pure metal, when shaken with air, presents no change upon its surface; while if impure it becomes covered with a grey film. It is slightly volatilised at ordinary temperatures, and at 662° F. it boils, and its vapour is in the form of a colourless vapour of sp. gr. 0.676. Hence it is capable of being distilled; and the fact of its being somewhat volatile at ordinary temperatures helps to explain its pernicious effects upon those whose trade requires them to come in contact with it, e.g., the makers of barometers, looking-glasses, &c. At a temperature of 39° F. it freezes, when it contracts considerably, and becomes malleable. In consequence of the uniform rate at which it expands when heated, from considerably below 0° to above 300°, it is employed in the construction of the mercury thermometer.

All mercurial compounds are either volatileised or decomposed by heat; and when heated with carbonate of soda they yield metallic mercury. Native or virgin quicksilver only occurs in small quantity, usually in cavities of veins of silver. Of mercury ores by far the most important is Cinnabar (q.v.). There are two means of obtaining the metal from the cinnabar: the ore may be burned in a furnace, in which case the sulphur is given off as sulphuric acid, and the oxide falls in a condensing chamber; or the ore may be distilled with some substance capable of combining with the sulphur— as, for example, with salted lime or iron filings. The mercury as imported is usually almost chemically pure; but if metallic mercury has been mixed with other metals as suspected, it may be pressed through leather, redistilled, and then digested for a few days in dilute cold nitric acid, which exerts little action on the mercury if more oxidisable metals are present; or better, in a solution of mercury nitrate, which decomposes mercury and takes up the more oxidisable metals. The mercury, after being washed with water, is chemically pure.

Mercury is first spoken of by Theophrastus (3d century B.C.); the name hydrargyrum (whence comes the symbol Hg) arises from the fact that it was known to the Greeks and Phoenicians procured cinaral from Almaden in Spain. After the discovery of the New World, the mercury of Peru was famous. California now produces the great bulk of the mercury of commerce, and it comes from the New Almaden mine. The total production of California was 66,857,000 lbs. (of 7 lbs. each) in 1851; in 1888 it had sunk to 33,250,000 lbs. (value $1,413,125).

There are two oxides of mercury, the black suboxide, HgO, and the red oxide, Hg₂O. Both of these lose all their oxygen when heated, and form salts with acids. The black suboxide, although a powerful base, is very unstable when isolated, being readily converted by gentle warmth, or even by mere exposure to light, into red oxide and the metal: HgO = Hg + Hg₂O. The most important of its salts is mercury nitrate, Hg(NO₃)₂, which, whose watery solution ammonia throws down a black precipitate known in pharmacy as Mercurius solubilis Halvemannii, from its discoverer, and consisting essentially of the black suboxide with some ammonia and nitric acid, which are apparently in combination. Hg₂O₃ (the red oxide) the most important salts are the nitrate, Hg₂(NO₃)₂ + 8aq; the sulphate, HgSO₄, which is employed in the manufacture of corrosive sublimate; and the basic sulphate, Hg₂SO₄·2H₂O, which is of a yellow colour, and is known as Tamarind. The inorganic salts of mercury in corrosive sublimate consist of the yellow nitrate, Hg₂(NO₃)₂; and it is added to corrosive sublimate in the manufacture of corrosive sublimate.

The chloride, HgCl₂, when crystallised from a watery solution occurs in long white glistening prisms; but when obtained by sublimation it occurs in white transparent heavy masses, which have a crystalline fracture, and chink with a peculiar metallic sound against the sides of the bottle in which they are contained. They melt at 509° F., and volatilise unchanged at about 570°. It has an acrid metallic taste. It is soluble in sixteen parts of cold, and in less than three parts of boiling water, and dissolves very freely in dilute nitric acid. It is added to corrosive sublimate in the manufacture of corrosive sublimate.

A double chloride of ammonium and mercury, represented by the formula CH₃CONH₂HgCl₂+Ag₂, has been long known as nit alomorph.) It combines with oxide of mercury in various proportions, forming a class of compounds of great interest in theoretical chemistry, termed oxychlorides of mercury. On adding a solution of corrosive sublimate to a solution of ammonium in excess, a compound, which from its physical characters is termed sodium subnitrate, is formed, the composition of which is Hg₂N₂H₂Cl₂. Chloride of mercury coagulates albumen, and combines with the albuminous tissues generally, forming sparingly soluble compounds.

Hence, in cases of poisoning with the white salt, in which they are comparatively insoluble, and for the same reason corrosive sublimate is powerful antiseptic, and is employed to destroy anatomical preparations.

Amongst the most important tests for this substance, which is not unfrequently called the 'white salt', is its combination in solution of potassium, which, when added to a crystal or to a watery solution of chloride of mercury, gives rise to the formation of
MERCURY

A bright scarlet isode of mercury. (2) The galvanic test, which may be applied in various ways, of which the simplest is the "gauze and key test," devised by Wallaston. He placed a drop of the fluid to be tested on a red-hot iron and simultaneously touched it and the surface of the gauze with an iron key; metallic mercury was deposited on the gauze in a bright silvery stain. (3) Precipitation on copper, and reduction. To apply the test we spread a suspected fluid with a few drops of hydrochloric acid, and introduce a little fine copper gauze, which soon becomes coated with mercury. On heating the gauze in a reduction tube the mercury is obtained in well-defined globules.

With iodine and brome mercury forms two iodides and bromides, corresponding in composition to the chlorides. Both the iodides are used in medicine; the bromides are of no practical importance. The subiodide, HgI, is a green powder formed by triturating 5 parts of iodide with 8 of mercury, and is of far less interest than the iodide, HgI2, which is most simply obtained by precipitating a solution of corrosive sublimate by a solution of iodide of potassium. The precipitate is at first salmon-coloured, but soon changes into a brilliant scarlet crystalline deposit.

This, when mixed with mercury—viz. a submethyl, HgS, a black powder of little importance, and a sulphide, HgS, which occurs naturally as Cinnabar (q.v.) Sulphide of mercury is thrown down as a black precipitate by passing sulphuretted hydrogen through a solution of a per-salt suspected (corrosive sublimate, for example). When dried and sublimed in vessels from which the air is excluded, it assumes its ordinary red colour. The well-known pigment vermilion is sulphide of mercury, and is sometimes obtained from pure cinnabar, but is more frequently an artificial product.

Mercury unites with most metals to form amalgams (q.v.), several of which are employed in the arts. Of the numerous organic compounds of mercury it is unnecessary to mention more than the alcohols and the ethylene HgCy, which may be prepared by distilling the oxide of mercury in hydrocyanic acid, and is the best source from which to obtain cyanogen.

The use of mercury are so numerous that a very brief allusion to the most important of these must suffice. It is used in the manufacture of some of the most important metals, and is used in the construction of philosophical instruments, and in the laboratory in the form of the mercury bath, &c. It is the source of the valuable pigment vermilion. The use of its chloride in anatomical preparations has been already noticed. Salts which are similarly found that wood, cordage, and canvas, if soaked in a solution of this salt (1 part to 60 or 80 of water), are better able to resist decay when exposed to the combined destructive influence of air and moisture.

MEDICAL USES OF MERCURY AND MERCURIALS.

While mercury is used in medicine in a state of very fine division in the form of granules, black pill, mercurial ointment, and other preparations, it is also used as mercurous and mercuric oxides and salts. As with other metals, the mercurial preparations have a local action and an action after absorption. The intensity of the local action varies, however, with the individual preparation; the persalts being soluble in water, and hence capable of precipitating albumen at once, are very irritating, while the mercurous salts and uncombined mercury, being insoluble in water, exert an effect only in so far as they are dissolved in the secretions. These differences in local action have a very great influence in determining their application in the different branches of medicine.

Locally, the various ointments, Liniments, and plasters are used as stimulants, astringents, antiseptics, and parasiticides, the persalts are used as antiseptic lotions, while the protosalts are little employed locally except Carbon Dealers. Absorption of mercurial preparations from the intestinal canal or skin takes place very readily, and in an hour or less the mercury may be detected in most of the secretions. After absorption into the blood all the preparations have the same action. In minute doses they act as alternatives, improving nutrition. In larger doses, such as are ordinarily used, they also exert profound alterative effects; but care must be exercised in their administration, otherwise symptoms of chronic poisoning are apt to ensue. These consist in excessive salivation, inflammation of the mouth and gums, and dyspepsia, while in severer cases caries of bone, nervous symptoms, a watery condition of the blood, albuminuria, cachexia, and other serious complications may occur. The mercurial preparations are given internally in syphils, in serious cases of catarrh, and in dropsy, as for example, of them, such as gray powder, blue pill, and calomel, are used as purgatives and as intestinal antisepsis.

The different preparations vary greatly, those of the persalts being very much smaller than in the case of the other preparations. Some persons are peculiarly susceptible to the action of mercurials, and show symptoms of chronic poisoning after very small amounts.

With regard to acute mercurial poisoning, this is due to irritation of the intestinal canal, and is only seen with the soluble salts when taken in overdose. The perchloride (corrosive sublimate) has been most frequently employed for the purpose of poisoning. The symptoms come on immediately, with a burning pain in the throat and violent pain in the abdomen, with vomiting and purging. There is always a mild deal of collapse, cyanosis, in the form of white of egg, is the best antidote.

Mercury, Dog's (Mercurialis), a genus of plants of the natural order Euphorbiaceae. The Common Dog's Mercury (M. perennis) is very common in woods and shady places in Britain. It is a pretty yet simple stem, rising generally with rough ovate leaves, and axillary loose spikes of greenish flowers. It turns a glaucous black colour in drying, and the root contains two colouring substances, one blue and the other carmine. It is very poisonous. The mercury which some old writers mention as a potherb is not this plant, but English Mercury, or Wild Spinach (Chenopodium bonus-Henricus). Annual Dog's Mercury (M. annua) is a much rarer British plant, and less poisonous. The leaves are indeed eaten in Germany as spinach. A half-shrubby species (M. tomentosa), found in the countries near the Mediterranean, has enjoyed an extraordinary reputation from ancient times; the absurd belief mentioned by Pliny being still retained, that if a woman after conception drink the juice of the male plant she will give birth to a boy, and if of the female plant will bequeath her Offspring to her son or daughter.

Meredith, George, novelist and poet, was born in Chalmers in Scotland in February 1828. In February 1849, his first appearance as a poet with 'Chillianwallah' in Chambers's Journal for July 1849. This was followed in 1851 by a little volume of Poems, and in
1855 by *The Shaving of Shagpat: an Arabian Entertainment*, a lightly original tale, in burlesque imitation of the manner of the Eastern story-teller. It shows a rich and brilliant imagination, and abounds in passages of tender feeling as well as of boisterous humour, but the incidents are involved and the machinery complicated, and reading is an Herculean task rendered inexpressibly hideous of hidden meanings which constantly elude one's grasp. In 1857 appeared *Farina: a Legend of Cologne*, a short story, reflecting the influence of German romance, which it partly imitates and partly parodies. His next novel, *Meriden* (1859) with *The Ordains of Richard Feverel: A History of a Father and a Son*, a tragic romance, dealing with the larger problems of education, especially in its ethical aspects. The novel of *Euan Harrington*, an amusing comedy of social anomalies, followed in 1861. *Modern Love, and Poems of the English Roadside, with Poems and Ballads*, was published in 1862, 'Modern Love' being the title of a sequence of fifty sonnet-like poems which tell their story in a somewhat dark and fragmentary manner, but with rare preservation of the strength and pathos. *Emita in England* (1864), now known as *Sandria Belloni*, has for its subject one of Meredith's most fascinating and original characters; it is continued in *Vittoria* (1866), the scene of which is laid in Italy at the time of the political risings of 1848. In 1865 had appeared *Richard Fleming*, the Richard Feverel a tragedy; the romantic Adventures of *Harry Richmond* followed in 1871. *Beauchamp's Career* (1875) is perhaps the most perfectly constructed of all the stories. *The Egoist* (1879) is a satirizing and unscrupulous story of rich and small-middle-class life. *The Tragic Commissary* (1881), originally published in the *Fortnightly Review*, is a somewhat close rendering of the well-known painful story of Lassalle's tragic end, founded upon the reminiscences of the Countess Ranovitska. *Diary of the Crossways* (1883) is also based on actual history. Other novels are *One of our Conquerors* (1891), *Lord Ormont and his Aminta* (1894), and *The Amazing Marriage* (1895).

Mr Meredith, who was literary reader for Chapman & Hall for over thirty years, began to issue a regular edition of English novels in 1869, of which is L.t. of *St Andrews* (1892). Three volumes of poetry are *Poems and Lyrics of the Joy of Earth* (1883), *Ballads and Poems of Tragic Life* (1887), and *A Reading of Earth* (1888).

Though it is claimed that Meredith is the foremost novelist of the day, and one of the most invigorating and stimulating thinkers of his generation, it can by no means be said that he is the most widely read. This distinction he has, that among the crowd of persons of taste and understanding who agree to crown Meredith a royal writer, his most resolute partisans are those of his own household—journalists, poets, and novelists, students of the art of fiction and practitioners of the noble English tongue. Among the elements of his power may be enumerated his wide, accurate, and sympathetic knowledge of nature and of life, his inventive resource, his analytic and synthetic power, and his mastery of words. His descriptions of scenery are varied, vivid, and full of poetry, his delineations of phases of feeling and thought of his characters are clear and convincing. Few writers have created so many characters of ideal beauty, who are at the same time so thoroughly human and marked by the strongest individuality—real, breathing, talking persons, whom the reader feels it a joy to have known. Among the defects of his qualities may be mentioned a certain intricacy of plot, or rather perhaps want of clearness in working it out, arising from an exaggerated reticence; also a frequent over-elaboration of style and structure which fatigues rather than exhilarates. And, though he is never 'sensational,' there is often a certain disregard of probability in the situations he invents. It is believed that Mr Meredith is, for the present at least, more extensively read by men than by women; and this, if a fact, may perhaps be partly accounted for by the purpose which he has so deliberately expressed, and so consistently carried out, of bringing philosophy into the domain of fiction. Much of his writing deals more or less directly, in a serious manner, with the most important problems of political science, and ethics. It is in his poetry that his deepest views of life really find their directest and most elementary expression. There is a study by Le Gallienne, *George Meredith: some Characteristics*, with a bibliography, by John Lane (1890).

*Merganser* (*Mergus*), a genus of birds of the family Anatidae, having a long, rather slender, straight bill hooked at the tip and notched at the edges. The genus embraces six species, nearly all inhabitants of the seas and coasts, and distributed over the northern regions of the Old and New World, and also in Madagascar, the Cape, and Brazil. The *Goosander* (*M. cingulata*), the largest and best-known British species. The red-breasted *Merganser* (*M. serrator*) is resident in Scotland, where it breeds not only on the coasts of Ross, Sutherland, and the Hervides, where it is abundant, but also on inland lochs and rivers. Its migrations extend southward to the lakes of Algeria and to Egypt. The Hooded *Merganser* (*M. endicolor*), a smaller species, is a very rare visitor of Britain. It is found in North America, from the St Lawrence to Alaska, where it breeds. It migrates south as far as Mexico, Cuba, Bermudas, and the Carolinas. The *Nun or Smew* (*M. albellus*) is a smaller species, passing the summer in the northern parts of the Old and New World, and ranging in winter as far south as India. Another species (*M. americana*) has as yet been found only in the *Auckland Islands*.

*Meru*, a seaport of Burma, on an island in the Tenasserim River, 2 miles from its mouth, with a harbour admitting vessels drawing 18 feet of water. Its trade is worth altogether close upon £100,000 a year. Exports, rice, timber, dried fish; imports, cotton, hides, rice, coffee, silk. The *district of Meru*, 200 miles long by 40 wide, is the southernmost in Burma. Area, 7,810 sq. m.; pop. about 60,000.

*Meru Archipelago*, a group of islands in the Gulf of Benga!; lying off the southern provinces of Burma; they are mountainous, some rising to 3,000 feet, of picturesque beauty, and sparsely inhabited by a race called the Selungs, who barter edible birds' nests with the Burmese and Malays for rice and spirits. Coastlands abound. Snakes and tigers, rhinoceros, deer, &c. are plentiful.

*Merida* (anc. *Augusta Emerita*), a decayed town of Spain, on the right bank of the Guadajana, 36 miles by rail E. of Badajoz. It is remarkable for its Roman remains, which include a bridge of 81 arches, 2873 feet long and 26 feet broad, erected by Trajan; the ruins of half a dozen temples, of which the aqueduct, the forum, and the baths are the most noted; a castle, and the Arch of Santiago, 44 feet high, built by Trajan. There is also an old Moorish palace. Merida was built in 23 B.C., and flourished in great splendour as the capital of Lusitania. In 715 it was taken by the Moors, who lost it to the Spaniards in 1229. Pop. 7300.

*Merida*, (1) capital of the Mexican state of Yucatan, is situated on a barren plain, 25 miles S. of Progreso, on the Gulf of Mexico, and 95 miles
This result shows that the earth is not spherical, as in that case the length of all degrees of latitude would be alike, but of spherical form—its curvature becomes less as we go from the extremity of its greater or equatorial diameter to the pole. See Earth.

Meridian, capital of Landes county, Mississippi, 135 miles by rail N. by W. of Mobile, contains a foundry and machine-shop, a cotton factory, and manufactories of blinds and sashes, furniture, &c. Pop. (1900) 14,050.

Mérimée, Prosper, a great French writer, was born at Paris, 28th September 1803, the son of a well-known painter. He was educated at the Collège Charlemagne, and tried law, but soon pronounced it unsuitable. He was in Spain during the revolution of 1830, and after his return became attached to the government, and held office successively in the ministry of Marine, of Commerce, and of the Interior, becoming finally Inspector of Historical Documents, in which capacity he visited the south and west of France, Auvergne, and Corsica. He had been long an intimate friend of the Countess Montijo, mother of the Empress Eugénie, and consequently enjoyed the closest intimacy with the imperial family at the Tuileries, Compiegne, and Biarritz, where Napoleon was under the influence of spirit and frankness of speech. Admitted to the Academy in 1844, he became a senator in 1853, and in 1858 president of the committee for reorganising the Bibliothèque Impériale. His last years were clouded by ill-health and melancholy, and the misfortunes of his country and the downfall of the imperial house hastened on his death, at Cannes, 23d September 1870.

Mérimée began his career as a writer at twenty-two, by an audacious literary espéritu, entitled Théâtre de Gozoli Guizzi, a collection of Spanish plays of singular maturity, represented as translated by Joseph L'Estrange, with his own portrait in female dress as frontispiece. A volume of pretended translations of Illyrian folk-songs, by an imaginary Hyacinthe Maganovitch, followed in 1837, under the title Guizzi. His more important works embrace novels and short stories, archaeological and historical dissertations, and travels, all of which display wide and exact learning, keen observation, strong intellectual grasp, grave irony and real humour, and withal a style that attains an exquisitely harmonious, symmetrical and imperious perfection, as the best French writers. Ever the refined and elegant scholar, he wrote, rather than affected to write, as a dilettante—"le gentleman auteur" as he was styled by his own countrymen. Of his more erudite works it may here be enough to name his Histoire de Don Pêdra l. Roi de Crudité (1849; Eng. trans. 1849); Études sur l'Histoire Romaine (1844); Les jeux Démétriens (1852); Monuments historiques (1843); and Mélanges historiques et littéraires (1853). But his greatest work is his tales, about twenty in number, some of which are among the rarest treasures of the romantic art: Colonos, Mateo Falconde, Carmen, La Venus d'Ille, Lobis, Arsène Guiliot, La Chambre Bleue, and L'Abbe Aubain. One of the most remarkable merits of some of these stories, as La Venus d'Ille and Lobis, is the dexterous manner in which an unmannish sentiment is triumphantly expressed.

Mérimée's character remains somewhat of an enigma, with its outward mask of cynicism, its inward capacity for the most tender and devoted friendship, its longing for the love of little children. In his constant struggle against impudence and mendacity, he, as usual, succeeded, but as he had himself of Saint-Clair in the Vase Etruscan, the victory cost him dear. Few lives have been more solitary and unhappy than Mérimée's, at once from a
paralyzing distrust of himself and of others, and from the constitutional melancholy of the septic to whom the world is only a scene of incomprehensible and fleeting images, and who mistrusts life and death alike. He was one of the few men who have drawn their unbelief from another more natural source. No great writer has left a more remarkable monument than the famous Lettres à une Inconnue (1873; Eng. trans., edited by R. H. Stoddard in Scribner's 'Bric-a-Brac' series), the revelation of a heart throughout an acquaintance, first of love, then of friendship, extending as far as thirty years. Here we find no selfish cynic, but a man with affectionate, delicate, touched with poetry despite his secu- lism, faithful and loyal unto death—his last words were written but two hours before the end. The unknown lady's actual existence has been questioned, and she has been doubtfully identified with the Countess Line Predzrzenska, sister of the Marquis de Noailles. What profession to her letters in reply were published in 1888, but without any explanation being offered; an English translation of these followed in two volumes in 1889. Only a few of the later letters are the Lettres à une Inconnue (1875) and the Letters to Panizzi (edited by Louis Fagan, 2 vols. 1931), full of lively gossip and clever criticism.

See the studies by Timisier (Mars. 1875) and Haus- soullaud (1899); also Tourneux, Prosper Mérimée, see Portraits de Mérimée (1879).

Merino (Span.), an important breed of Sheep (q.v.). See also Wool.

Merlon'eth, a triangular county of Wales, with a maximum length and breadth of 45 miles, bounded by 30, a sea board of 38 miles, and an area of 682 sq. m., or 383,219 acres, is bounded on the N. by the counties of Carnarvon and Denbigh, E. and S. by Montgomeryshire and the river Dovey, and W. by Cardigansh. Pop. (1801) 27,500; (1814) 39,392; (1891) 49,204. Chils alternating with low-lying sands skirt the coast, which at some distance out to sea is fringed by dangerous sandbanks. Inland, the surface, although nowhere attaining such an altitude as that of Carnarvonshire, is rugged and mountainous in the extreme, interspersed in places with picturesque valleys, lakes, and rivers. The largest lakes are Aran Mwyddly (2970 feet), Cadair Idris (q.v., 2014), and Aran Benllyn (2002) are the highest peaks; Bala is the largest lake; whilst of rivers the principal is the Dee, which runs north-east, and the Dovey and Mawddach, which reach the sea after a south-west course. The soil generally is poor, and large tracts are unfit for profitable cultivation, the total extent of land in crop in 1889 only amounting to 169,817 acres of which 128,621 acres were in permanent pasture. Great numbers of sheep are bred, and lambs and woolloons to some extent manufactured, but the principal wealth of the county arises from its mineral products. Slate and limestone are largely quarried, much manganese ore is worked, and a number of mines in the vicinity of Dolgelley and Bala 3800 oz. of gold and over £13,227 were in 1889 obtained. Monmouth, which contains no municipal boroughs, is divided into five hundreds, and thirty-three civil parishes, partly in the diocese of Bangor, and partly in that of St Asaph. For Civil purposes it is in the North Wales circuit, Dolgelley having a small town, and it sends one representative to the House of Commons. The County Council numbers fifty-six members, and the principal towns, other than the foregoing, are: Mold, Barmouth, Conwen, Festiniog, Harlech, and Towy.

Meristem, the formative tissue of plants, is distinguished from the permanent tissues by the power its cells have of dividing and forming new cells. Meristem forms the tissue of embryonic plants, and of apexes of stems and roots.

Merivale, John Herman, an English scholar and translator, was born at Exeter in 1779, the grandson of Samuel Merivale (1715–71), a worthy Fellow of Exeter College, and pastor at Tavistock. He was sent to St John's College, Cambridge, and was called to the bar in 1803. He continued largely to Bland's Collections from the Greek Anthology (1813), and brought out a second edition himself in 1833. From 1833 to his death in 1844 he held the office of Commissioner of Bankruptcy. Works of no little merit, e.g. his Poems, Original and Translated (1841), and Memoirs of Schiller (1844).—Charles, son of the preceding (b. 1808, d. 1893), was educated at Harrow, Haileybury, and St John's College, Cambridge, where he took his degree in 1830, and became in due course fellow and tutor, and afterwards successively select preacher at Cambridge (1838–40) and at Whitehall (1839–41), Hulsean lecturer (1861), and Boyle lecturer (1864–65). From 1848 to 1869 rector of Lawford in Essex, he was chaplain to the Speaker from 1869 to 1873. He was dean of Ely from 1869 till his death, 26th December 1869. His History of the Roman Republic (1853) is a brilliant sketch, marred by its over-indulgence to imperialism, the life and fate of his admirably learned and eloquent History of the Roman under the Empire (7 vols. 1859–62). Later works are a serviceable General History of Rome (1875), Early Church History (1879), and The Contrast between Pagan and Christian Society (1880).—Another son, Herman, born in 1806, was educated at Harrow and Trinity College, Oxford, elected Fellow of Balliol, called to the bar in 1832, and appointed professor of Political Economy at Oxford in 1837, and, later, permanent Under-secretary of State first for the colonies, next for India. In 1859 he was made C.B. He died on February 8, 1874.—His son, Herman Charles, born in 1836, has written a number of successful plays, including Jorgette, The Puppet and The Don, and The Master of Racewood. Besides a novel, Funuit of Balliol (1892; in its stage form, The Cynic), he has published The White Pilgrim and other Poems (1883), and other works. See the privately printed Family Memorials, compiled by Anna W. Merivale (1884).

Merce D'Aubigné. See D'AUBIGNÉ.

Merlin, the name of an ancient British prophet and magician, who is supposed to have flourished during the decline of the native British power in its contest with the Saxon invaders. The prophetic child Ambrosius first mentioned by Nennius in his Historia Britonum was confounded with Ambrosius Aurelianus, the conqueror of Vortigern, and subsequently the resulting Merlin Emerys or Ambrosius was confounded with the Merlin called Silvester or Caleiaiones. It is as the subject of one of the cycle of Arthurian romances that Merlin's name has survived. The romances of Merlin is said by Geoffrey of Monmouth, in his Historia Regum Britoniarum, with Vita Merlini, to have lived in the 5th century, to have sprung from the intercourse of a demon with a Welsh princess, to have been rescued from his evil destiny by baptism, and to have displayed the possessors of miracles powers from infancy. The adventures of Merlin were various, with additions from Armorican and other sources, from the Latin of Geoffrey, and made popular in the French language by Robert Wace and Robert de Boron. Henry Longfellow's English verse translation is in the library of Corpus Christi College, Cambridge. The analysis of the romance of Merlin in Ellis's Specimens of Early English Metrical Romances was made from the MS. in Lincoln's Inn Library. There is a MS. in the Advocates' Library,
Edinburgh, and one in Bishop Percy’s folio MS. (printed in 1687). The prose romance is longer and more important than the metrical one. Merlin, Roman en Frose du XIII Siècle, was published by the Société des Anciens Textes Français in 1868, and the Early English Text Society published under the editorship of the present writer in 1863–69 Merlin, or the Early History of King Arthur about 1250–90, printed from the MS. in the Cambridge University Library. Merlin is frequently referred to by our other poets, especially by Spenser, and his story occupies a prominent position in Tennyson’s Idylls of the King. A collection of prophecies attributed to Merlin appeared in French (Paris, 1498), in English (London, 1529 and 1333), and in Latin (Venice, 1534); and their existence is traceable at least as far back as the middle of the 14th century. The Strathclyde, or—if we may be allowed an expression which anticipates history—the Scottish Merlin, called Merlin the Wyllit, or Merlin Caledonius, is placed in the 6th century, and appears as a contemporary of St. Kentigern. A map of Glasgow, his grave is still shown at Drummelzier on the Tweed, where, in attempting to escape across the river from a band of hostile rusties, he was impaled on a hidden stake. A metrical life of him in Latin, extending to 8648 lines, profusely based on Armouric materials, and attributed to Geoffrey of Monmouth was published by the Roxburghe Club in 1833. His prophecies—published at Edinburgh in 1615—contain those ascribed to the Welsh Merlin.

Merlin. See Falcon.

Mermaids and Mermen, in the popular folklore of Europe, a class of beings more or less like men, living in the sea, but in some circumstances capable of social relationships with men and women. The typical mermaid has the head and body of a lovely woman to the waist, ending in the tail of a fish with fins and scales. She has long and beautiful hair, and is often seen above the surface of the water, combing it with one hand while the other she holds a mirror. She often discloses what is about her, or her intentions, and seldom gives supernatural knowledge and powers to a favoured mortal—a thing in perfect keeping with primitive notions of sorcery, which easily attributed exceptional powers to beautiful women, as has been shown. Again, she sometimes exercises a special guardianship over an individual, and avenges his wrongs; but her relation to man most often brings with it disaster. There are many stories of mermaids who have fallen in love with men, or been detained through the possession of the skin which they had stripped to dance on the shore, and who have been faithful wives and mothers until they found an opportunity to return to the sea. And there are examples of the converse case of a mermaid falling in love with a man and enticing him to go and live with her under the sea, as when a merman bewitching and carrying off a mortal maiden.

Such are the principal forms of mermaid stories found everywhere, with more or less artistic elaboration. The Danish Haffaund or Marenfin, the Irish Menere, the Breton Marie-Mercoeur, the Russian Evsinich or Volga-ncvody or water-sprite, some forms of the Tontonic nixies, and the enchanting Sirens of classical mythology have all close affinities with each other in the dangers they bring to men, the beauty and joyousness of their lives, and yet the gloom of sadness that overhangs their doom. In their malignant aspect they touch the general doctrine of Demonology (q.v.), and may be explained on an animistic theory of its origin. To the beauty of the conception and the elaborations of which it is capable in the popular imagination we owe some of the loveliest of our folk-tales as well as such delightful artistic tales as Ulysses and many fine poems of the ages of literary culture. One of the most detailed stories of this class is that of Melusine (q.v.). The mermaid had a firm hold of the imagination of our fathers, and, besides the witness of heraldry, we have stories supported by excellent evidence of their appearance and capture. One was caught at Elam in 1409 was carried to Haarlem and kept there many years. She learned to spin and showed a becoming reverence for the cross. See Baring-Gould’s Popular Myths of the Middle Ages, and Schuhl’s Contes des Marins (1852).

Mermaid’s Purse, the popular name of the egg-case of the skate (or of some other cartilaginous fish), which is often cast up empty on the shore. Mermaid’s Gloves is a very common British shell, Chlamys oculata.

Merne. See Ethiopia.

Meropidae. See Bee-eaters.

Merovingians, or Merovings, the first dynasty of Frankish kings in Gaul. The name is derived from Merwig or Merovech, king of the western or Salian Franks from 448 to 457. His grandson Neustrians (circa 541) is the first of the dynasties which gave way to the Carolingians (q.v.) in 752. See France, Franks.

Merrie, a river rising among the White Mountains of New Hampshire, flowing south into Massachusetts, and falling into the Atlantic Ocean near Newburyport, after a course of 130 miles. It has numerous falls, affording immense water-power. The principal manufacturing towns on its banks are Manchester, Nashua, and Concord in New Hampshire, and Lowell and Lawrence in Massachusetts. It is navigable to Haverhill.

Mersburg, a town of Prussian Saxony, on the Saaale, 8 miles S. of Halle. Its Domkirche is a four-towered pile, with Romanesque choir (1042), transept (circa 1274), and 16th-century wings, which give the whole restored in 1884–86. The organ (1666) has 4000 pipes; and there is a very early bronze effigy in low relief of Rudolph of Swabia, who here was defeated and slain by Henry IV. in 1080. The castle, a picturesque pile, most likely built by the prince-bishops, was once the bishop’s palace, and afterwards (1636–1738) the residence of the dukes of Sachsen-Merseburg. Beer, iron, paper, &c. are manufactured. Pop. (1875) 15,664; (1890) 17,069. Henry the Fowler in 934 gained his great victory over the Hungarians near Merseburg, which suffered much in the Peasants’ War and in the Thirty Years’ War.

Mersenne, Marin, a constant friend of Descartes, was born in 1588, and died at Paris in 1648. He was a fellow-student of Descartes at the Jesuit College of La Fleche, and took the habit of a MINOR FRIPER in 1611; his life thereafter was spent in study, teaching in convent-schools, and travel. He did valiant battle with numerous clerical con-traversialists on behalf of the orthodoxy of the philosophy of Descartes, and wrote vigorously against atheists and other unbelievers. His profound knowledge of mathematics is proved by a number of books, and in his Harmonie Universelle (1636), an invaluable contribution to the science of music.

Mersey, an important river of England, separates, in its lower course, the counties of Chester and Lancashire, and has its outlet in the junction of the Esherow and Goyt, on the borders of Derbyshire, east of Stockport. It flows in a west-south-west direction, and is joined on the right
by the Irwell 6 miles below Manchester, from where it was made navigable to Liverpool for large vessels in the year 1720, and has had great influence on the development of the town. Besides the Irwell the chief alluents are the Bollin and the Weaver from Cheshire. At its junction with the Weaver the Mersey expands into a wide estuary which forms the Liverpool channel. The estuary is about 16 miles long and 3 miles broad; log-boats in the river are it is a mile and a quarter in width, with a considerable depth at low-water. In this estuary on the Cheshire side is the entrance to the Manchester Ship- canal. The estuary is much obstructed by sandbanks, but the excellent system of piloting in practice, combined with the skill and admirable construction of the sea-walls, renders the navigation comparatively secure. Entire length, with the estuary, 70 miles. A tunnel connecting Liverpool and Birkenhead by railway carried beneath the estuary has been in successful operation since January 29, 1883. The alluvial meadows on the banks of the Mersey are famous for their fertility, and in recent years, by embanking the river at points where it overflowed after heavy rains, many thousands of acres of the most valuable land in the county have been reclaimed. The basin of the Mersey extends over an area of 1706 sq. m., which includes the larger portion of Lancashire and Cheshire.

**Merthyr-Tydfil or Tydfl** (so called from the martyrdom here of a Welsh princess of that name), a parliamentary borough and market-town of South Wales, on the confines of the counties of Glamorgan, Brecknock, and Radnor, 14¼ miles to the W. of Caerliff, its port, and 178 W. of London. Pop. (1801) 7705; (1891) 58,680. Surrounded by lofty and bleak hills, the town stands on the banks of the river Taff, and is partly built on slag foundations, the refuse of mines in the vicinity. Its streets are for the most part narrow and irregularly built, and the public buildings of little architectural interest, but of late years—since the formation of a Local Board of Health in 1850—great improvements have been effected in the water supply of thoroughfares, the supply of pure water, and the construction of effective sewage works: previously all sanitary arrangements were entirely neglected, and as a result epidemics of great severity were of frequent occurrence. The civil government of the town (which extends over the two grand Brecknock and Radnor), viz., the magistrates and police, is vested in a high constable, who is elected annually. The sole industries, upon which the whole population is more or less directly dependent, arise from the numerous collieries and iron and steel works in the vicinity; Merthyr being the centre of the Glamorganshire coalfield, and as such having excellent railway communication with all parts. With Aberdare it is noted for the excellence of its steam coal, and the quantity of iron and steel annually turned out from the great works of Dowlais, Aberdare, and Cyfarthfa, which is of service to the Merv.

**Merton**. **Lower**, a village of Surrey, 10 miles SW. of London by rail, stands on the Wandle, and has several factories. Only a fragment remains of the Augustinian priory (1116) in which the parliament met which passed, in 1225, the Statute of Merton (see **LEGITIMATION**). Here were educated Thomas Becket and Walter de Merton, Bishop of Rochester and Chancellor, who in 1264 founded Merton College, at Oxford. The church is mainly of the same date as the priory. Pop. of parish, 2480.

**Meru**, in Hindu Mythology, a fabulous mountain in the centre of the world, 80,000 leagues high. It is the most sacred of all mythical mountains, and the abode of Vishnu.

**Merv**, an oasis of Turkistan, lying between Bokhara and the north-eastern corner of Persia. 412 miles by rail (opened only 1886) from the Caspian and 144 miles from the Oxus. The oasis consists of a district 60 miles long by 40 broad, watered by the river Murghab, grows wheat, sugar, grass, cotton, and silk, has a hot, dry climate, and is inhabited by half a million (O'Donovan); the Russians say less than a quarter million. The Tekkes and Turkomans. The people live scattered over the country. But there is an old citadel, Kauish Khan Kaln, and adjoining it a new Russian fort garrisoned by nearly 3000 men; on the opposite bank of the Murghab a new Russian town is growing up, seeming to have been built on the spot and monopolised the trade, worth about £150,000 a year. The men are clever workers in silver, and breed horses, camels, and sheep; the women weave silk and make carpets. Merv or Mounru is mentioned in the Zend Avesta; there Alexander leaped over a tower.

**Mesembryanthemum**, a town in Southern Italy, 12 miles SW. of Brindisi, grows good olive-oil. Pop. 9000.

**Mesembryaceae**, or **Ficoidae**, a natural order of calyciflorous dicotyledonous plants, comprising succulent shrubs, herbaceous perennials, and annuals with opposite leaves. In many species the latter are of curious and fantastic shape, especially in those of the typical genus Mesembryanthemum. The order contains sixteen genera and over 400 species, the larger number of the latter belonging to the genus Mesembryanthemum. They are inhabitants of warm regions chiefly, most of them being found at the Cape of Good Hope and in the South Sea Islands. The typical genus is also the most important in regard to utility and beauty. It furnishes the ice Plant (q.v.) of desert gardens, and many other beautiful and curious

---

**Meryen, Charles**, etcher, was born at Paris, the son of an English physician, in 1821, and died insane at Chalcreston Asylum, 13th February 1868. His sable and imaginative etchings of streets and buildings in Paris are highly esteemed by connoisseurs, especially the "Abside de Notre Dame," "Rue des Mauvais Garçons," and "Stryge." See *Wedmore in Nineteenth Century* (1878) and *Art Journal* (1881), and Burty's monograph (1879).

**Mesagna**, a town in Southern Italy, 12 miles SW. of Brindisi, grows good olive-oil. Pop. 9000.
species are to be met with in our greenhouses. M. nudiflorum is employed in the manufacture of Moroccan leather, and furnishes abundance of alkali. The Kou of the Hottentots is M. emer-ridium, the roots, stems, and leaves of which they collect and beat and twist together, and then ferment and open up so as to satisfy their thirst. If chewed immediately after fermentation it is narcotic and intoxicating. It is the Canna Root of the Cape colonists. The Hottentot’s Fig (M. edule) is abundant on the sandy plains of the Cape of Good Hope, and the fruit is eaten when ripe. The leaves eaten when young are fresh, and when somewhat older are jellied in vinegar. The juice of the plant has some reputation as a cure for dysentery and thrush in children, and as an external application for burns. The fruit of M. euphoribes is named figs’ faces to Australia, and is eaten by the natives; that of M. generically M. is ground into flour in Africa and made into bread, as is that of the Ice Plant. The Flower of Crete is the seed-vessel of M. tripolium, which in the rainy season expands in the form of a small green ball allowing a seed to emerge. The seed should be spelled Mesembriaceae, as it is from the Gr. mesembria, ‘mid-day,’ because the flowers bloom usually at mid-day.

Mesentery (Gr. meson, ‘middle;’ enteron, ‘the intestine’) is the broad fold of peritoneum (the great serous membrane of the abdomen) which attaches the intestines (strictly the small intestines) to the mesenteric arteries, nerves, and the corresponding structure in connection with the different parts of the large intestine) posteriorly to the vertebral column. It serves to retain the intestines in their place, while it at the same time allows the necessary amount of movement, and it contains numerous large vessels that serve as vessels the nerves which pass to them, the lacteal vessels, and mesenteric glands. These glands are 100 to 150 in number, and are about the size of an almond. They exert an organizing action on the contents of the lacteal, the clycle being more abundant in the intestine and in corpuses after it has passed through them. The only disease of any importance affecting these glands is Tubercle (q.v.), which, when extensively developed in them, is sometimes called tubercular.

Mesolithic (‘the place of martyrdom’) also spelt Mesedh and Mushhad, the principal city of north-eastern Persia, the capital of Khorasan, and of large size and importance.
The city stands on a tributary of the Hari-Rud, 400 miles E. by N. from Tehran and 290 NW. of Herat, and has a beautiful appearance when seen from a distance. Above the walls, which are of great circuit, shine the gilded domes and minarets of one of the most splen- did mosques of the East, that built above the tomb of Imam Riza, a follower of Ali, and the eighth imam of the Shiite sect. Mesilah is the sacred city of the Shiites, and is held in as much veneration by them as Mecca is by the Sunni Muselmans; it is visited every year by nearly 100,000 pilgrims. The city is besieged by a wide treeshaded street, down the middle of which flows a muddy current between low stone walls. There is another handsome mosque, and several colleges and madrasahs. The principal trade consists of felt-rugs, carpets, swords, turquoise jewellery, velvet, and cotton and silk goods. Opium (£37,200), woollens and cottons, dried fruits, turquoises (£7,200) are exported to Russia, India, and Afghanistan, to the total value of £169,600. The imports consist of textiles, sugars, &c. from Russia (£10,400), textiles, &c. from Britain (£34,300), tea (£124,500), &c. from India (total, £184,600), and miscellaneous goods from Afghanistan (£17,300) and from Turkey (£6,000). The Transcaucasian Railway via Merv is giving Russia the predominance in trade with Meshed. The fixed population is about 50,000. Owing to its elevated situation (3035 feet), the city has a cold climate in winter; there is thunder-storm in summer, the temperature rising to 92° F. Close by are the ruins of Tus, the old capital of Khorassan, where the celebrated poet Findausi, Haroun-al-Raschid, and the Imam Riza were buried. See O’Donovan, Mero Oasis (1882), and J. Bassett, Persia (1883).

Mesopotamia, see HISSIHMESKOUTIN (the Arcadian Basin), a place in Algeria, 48 miles (77 by rail) E. by N. of Constantine, with remarkable hot baths (203° F.), known to the Romans as Ancyra Tiburtina. They and the adjoining ferruginous and sulphurous springs (170°) are still used medicinally. The inunctions of carbonate of lime and clouds of steam, &c. give the region a very singular appearance.

Mesner, Friedrich Anton or Franz, the founder of the doctrine of Animal Magnetism (q.v.), was born near Constance, 23th May 1734. He was bred for the priesthood at Dillingen and Ingolstadt, and took up the study of medicine in Vienna, and took his doctor’s degree in 1766 with a treatise De planetarum influxu. About 1772 he began with a Jesuit, Hell, to investigate the curative powers of the magnet, and was led to adopt the opinion that there exists a power, similar to magnetism, which exercises an extraordinary influence on the human body. This he called animal magnetism, and published an account of his discovery, and of its medicinal value, in 1775. In 1778 he went to Paris, where he created a great sensation. His system obtained the support of numerous persons of all ranks and abilities, who gave it new life and vigour; but he refused an offer of an annual pension of 20,000 livres (about £800) to reveal his secret; and this, combined with other circumstances, gave rise to suspicion, and induced the government in 1785 to appoint a commission, composed of physicians and scientists (Bally, Franklin, Lavoisier, &c.), whose report was unfavourable to him. He now fell into disrepute, and, after a visit to England, retired to Meersburg, in Switzerland, where he spent the rest of his life in complete obscurity. He died 11th March 1813. See his Life by J. Kerner (Frankf. 1856), and P. Anderson’s Grammer’s Mesner the Magnetiser (1890).

Mesoderm. See Embryology.

Mesosolongion. See Missolonghi.

Mesopotamia (‘between the rivers’), the district between the rivers Tigri and Euphrates, extending from the foot of the Armenian mountains south-eastwards to near the neighbourhood of Baghdad. The name is the Greek equivalent of the old Aramaic (Syrian) Aram-Naharaim, and became current after Alexander’s Asiatic conquests; the Arabs call the district El-Jezira (‘the island’). It has an area of about 55,000 sq. m., the surface is level and falls from an altitude of 110 feet in the north-west to 560 feet in the south-east, where the alluvial region of Babylonia (Iraq) begins. The soil is sandy, but, when well watered or, as it was in ancient times, well irrigated, it develops extraordinary fertility. Yet since the Turks (1850) made themselves masters of the region (15,143 sq. m.), it has fallen more and more to barrenness and neglect. Having been in the possession successively of the Assyrians, Babylonia, Persians, Greeks, Romans, Arabs, and Turks, and many a time and oft the battle-ground between the armies of mighty empires, its records are full of stirring events and great changes and vicissitudes. Amongst the cities of

history fame may be quoted Haran, Surug (Sriru), Apsana, Elesa, Nishis, Ninephorion (Rakka), Hit (Is), Mardin, Mosul (Nineveh), Amid (Diarbakir), and Thapsacus. In biblical times this region was inhabited by prosperous Aramaean agriculturists. At the present time the population consists chiefly of semi-nomad Arameans, a Moslem Kuris, who keep herds of camels, sheep, and goats, and grow wheat, barley, rice, millet, sesamum, besides cotton, tobacco, safflower, hemp, cucumbers, melons, and other fruits. There is little timber on the plains. Wild logs, jackals, hyenas, cheetahs, and wolves, are common; but lions and wild asses, so numerous in antiquity, are now scarce. In summer excessive heat (up to 122° F.) prevails, whilst the winter is comparatively cool—the thermometer may go down to 14° F. A brief summary of the work of exploring ancient sites, and of sites still to be excavated, is given in the Academy, 12th June 1866. See articles on the empires and towns mentioned above; also TIGRES, EUPHARIES, and works quoted there.

Mesoza, a term applied by Van Beneden to a number of extremely small animal parasites, found in cut-fishes, brittle-stars, and some worms. In these forms, in the cells, the inner forming reproductive elements; but these are divided out and gone, and are sometimes very like the larval forms (pulmonates) of some jelly-fish and other stinging animals. The name refers to their apparent median position between the single-celled Prozoa and the many-celled Metazoa.

Dicyemida.

Mesozeel (Gr., 'middle-life'), a term introduced by Professor Phillips to designate the group of geometrical systems, the fossil remains of which differ equally from those of the Palaeozoic ('ancient-life') and Cenozoic ('newer-life') eras. It is synonymous with the term Secondary, and includes the Triassic, Jurassic, and Cretaceous systems.

Mess (Fr. mets, Old Fr. mez, Ital. messa, 'a dish, from Lat. messa, 'sent,' or 'served up') originally signified a dish or portion of food. In the British army and navy the men are divided into 'messes' of whatever number is most convenient for taking their meals together. Officers and sergeants also have their 'messes,' which, in addition to being 'economy' in the use of their number of men, are much of the nature of clubs, having smoking, billiard, and reading rooms attached to them, and often libraries.

In the army each man, unless married, or for other reasons allowed to live out of mess, pays a daily rate of 5d. a day to his mess, which is managed by a non-commissioned officer under the supervision of an officer. For this sum he is provided with groceries, vegetables, puddings, and plates and mugs. A knife, fork, and spoon is part of his kit which he must always have with him. His rations (2 lb. of meat, including bone, and 1 lb. of bread per day) are given him free, but are drawn in bulk for the whole mess, the men rations being cooked together and only distributed at dinner, which is eaten in the barrack-room where quarters of the men are placed. Tea and breakfast are similarly served. The men's washing is also managed by messes, and charged in the monthly mess accounts. One of the mess is told off as cook each day. He cleans the room, sets the table, and rations up, but the actual cooking is done by trained cooks. Sergeants' Messes are managed by one of themselves under a committee of sergeants supervised by an officer, the adjutant if possible. There is a small entrance fee (usually three days' pay) and a monthly subscription for newspapers, &c. Some furniture is provided by government, but kitchen and table require carpets, pictures, &c. are purchased out of the mess funds.

Officers' Messes are very similar, but on a larger scale. Every officer on joining is charged an entrance fee of thirty days' pay towards the maintenance of the mess, and thirty days' difference of pay on promotion. Unless married or specially exempt, an officer is charged for the cost of a meal for each member of his regiment—i.e. he pays the regulated price for his dinner whether he eats it or not; other meals, as well as wine, cigars, &c., are only charged if taken. All officers also pay a monthly subscription of two-thirds of a day's pay for single, and half that amount for married officers, towards keeping up the mess establishment, such as furniture, livery, wages of servants, table-linen, &c. The only assistance received from government is £25 a year for each troop, battery, or company associated with the mess, but this is only at home and in times of peace, the captain of the ship being responsible for the expenses of the mess.

In the British navy there are in all ships as a rule, one of the smaller officers' messes (or huts) for officers: the ward-room, the gun-room, the engineers' mess and the warrant-officers' mess.

The ward-room includes all officers, below the captain (who messes by himself), who are above the rank of sub-lieutenant. The gun-room contains the warrant-officers, petty officers, junior assistant-paymasters, and clerks; the engineers' mess, all engineers not entitled to mess in the ward-room; the warrant-officers' mess, the gunner, boatswain, and carpenter. In troopships there is one general mess for all officers, naval and military, including the captain of the ship. The system of having one general mess has been tried in other ships, but it has been found impossible so far to arrange for a mess-place sufficienty large to allow of all the officers sitting together. The mess of an individual officer may be for men of any rank, the men paying a fixed rate and adding to that the cost of wine, if any, and the difference of his rations. The mess-place for the engineer officer is, however, being gradually done away with, those engineers not entitled to mess in the ward-room mustering in the gun-room.

Among the ship's companies the chief petty-officers, first-class petty-officers, and the engine-room officers have respectively their own mess-places, while the rest of the crew are divided off into messes, according to their numbers, the marines and stokers forming messes by themselves. Flag-officers and officers in command of ships can draw all their plate, glass, china, and linen from the dockyard, paying the Admiralty a percentage for the use of it. The officers of the other messes are supplied on commissioning with a complete set of mess-traps, linen, &c., free of charge, which they have afterwards to keep up at their own expense. All officers and men, admiral and second-class boy alike, are entitled to the same daily rations. Officers, however, are not compelled to take up their rations, but can take up as much or as little of it as they please, receiving instead a money allowance, which is paid into the mess-fund. The petty-officers must take up two-thirds of their rations, but they can receive money in lieu of the remaining third. Rum is no longer served out to the officers, but the men still continue to receive their half-gill.

Messagiers Maritimes, or in full, 'La Compagnie des Messagiers Maritimes,' a great French shipping company of Mar-
seilles, its headquarters, trading with the Levant and Black Sea, with eastern Asia and Australia, by way of the Suez Canal, and with Spain and Algiers.

**Messalina, Valeria**, the daughter of Marcus Valerius Messalla Barbatius, and wife of the Roman emperor Claudius, a woman infamous for her rivalry and monstrous perfidy. The advantage of the weakness and stupidity of the emperor, she played the harlot without restraint, and murdered all who murmured at her gilded shame. The best blood of Rome flowed at her pleasure: among her victims were the daughters of Germanicus, Drusus, Justina, M. Vinicius, Valerius Asiaticus, and her confederate Polibius. During a temporary absence of the emperor she went so far in open shamelessness as publicly to marry C. Silius, one of her favourites. The blinded emperor's eyes were at last opened by his freedman Narcissus, and he ordered her to give orders for her execution. She was put to death by Eutusius, a tribune of the guards, in the gardens of Lucullus, 48 A.D.

**Messapians.** See Apulia, Inscriptions.

**Messeuger.** King's (queen's), officers employed by secretaries of state to convey valuable and confidential despatches at home and abroad.

**Messenia,** in ancient Greece, the western of the three peninsulas that project southwestwards from the Peloponnesus, was bounded on the E. by Laconia, and on the N. by Arcadia and Elis. It was composed chiefly of fertile plains, separated by mountain-chains and watered by the Panisius and other streams, and yielded abundant corn and wine. The original Pelasgic inhabitants were conquered by the Dorians, but soon absorbed their conquerors and rose to great prosperity. This excited the envy of the Spartans, who waged two long wars (743-724 and 695-668) against the brave Messenians. Most of those who survived the second war emigrated to Sicily, where they took possession of Zancle, and changed its name to Messina, the present Messina. Those who submitted to Sparta were made helots; but they revolted and waged a third war of ten years' duration (from 461). The survivors settled in Naupaktos. After the battle of Leuctra (371) Euripides invited the descen- dants of the Messenians back to Greece, and they joyfully responded to his invitation. Their independence continued till the Roman conquest in 146 B.C. Messenia is the name of a province of the modern kingdom of Greece.

**Messiah** (Heb. Mashiach, equivalent to the Greek Christos, *the Anointed*) designates, in the Old Testament, the great Deliverer and Saviour, whom the Jews expected to be sent by God, not only to restore their country to the power and splendour which it exhibited in the days of David, but even, by compelling the Gentiles to acknowledge the supremacy of the throne of David, to raise it to the summit of universal dominion. See Bible, Vol. II, p. 118; and for the New Testament, Messiah, see articles Bible (p. 123), Christ, and JESUS CHRIST. See also Jews, and Mahdi.

**Messina,** the second city of Sicily, stands on the western shore of the straits of the same name, 110 miles E. of Palermo, and 109 miles S. of Naples. The city occupies a narrow strip of coast between the harbour and the hills behind; the opposite or eastern side of the harbour is formed by a sickle-shaped tongue of rock, that only leaves a narrow entrance on the north. Although a very ancient city, Messina has no ancient buildings or remains. The destructive hands of enemies, and the still more destructive agency of earthquakes, are responsible for this. The greater part of the city was laid out, regularly, with handsome houses, after the earthquake of 1768. The cathedral was begun by Count Roger the Norman in 1098, but has been almost wholly rebuilt since then. This and the churches of St Gregory and St Niccolo are adorned with magnificent mosaics. The cathedral has also a valuable collection of bronzes, a statue, and a venerated treasure in a reputed letter of the Virgin to the townsman. The citadel was built by Charles II. of Spain in 1680, the Gonzaga Castle in 1546, and another castle in 1547-57. The hand- some traces of the palaces, and other buildings are for the most part modern. There is a university, founded in 1549, with fifty teachers and two hundred students, a college of the fine arts, an academy of the sciences and arts, scientific collections, and technical schools. Messina is an archbishop's see. The industry is confined chiefly to muslin, linen, and silk goods, the working of coral, and the preparation of fruit essences. The harbour, which is very deep and well protected, is entered annually by some 3570 vessels of 1,277,000 tons burden, bringing imports (wheat, cottons, flour, hides, silk and silk goods, dried fish, woolens, iron &c.) to the annual value of £1,094,280. The exports, embracing principally fruits and their manufactured products, such as wine, essences, olive-oil, seeds, &c., average £1,204,720 annually. More than half the shipping is Italian, and about one-third British. Pop. (1881) 78,894, and of the communi- cy, 126,497 (1896, 146,400).

Founded in 734 B.C. by the people of Cumae, the place was first called Zancle (i.e. a sickle), and through the commercial enterprise of its people rapidly grew in prosperity. In 495 Anaxilaus of Rheneum offered to take it and changed its name to Messana (Messenec). The Carthaginians con- quer-r and destroyed it in 396, and in 288 it fell into the hands of the Mamertines, who again changed its name to Mamertina. The intestinal quarrels of these people gave occasion to the outbreak of the Punic war between Carthage and Rome, on the conclusion of which (241 B.C.) the city became Roman, and in due time passed to the Eastern Empire. The Saracens took the city in the 6th century, and were only expelled in the 11th century by the Normans. Here the Sicilian Vespers' revolt took place, and in 289 it fell into the hands of the cities from that year down to 1713 Messina belonged to Spain. The people revolted in 1671 and were backed up by France, but were reduced to submission in 1678, and at the same time deprived of their privileges by their Spanish government. Then in 1743 the plague, and forty years after an earthquake, came to complete the ruin of the city. It was, moreover, bombarded by the Neapolitans in 1848, and in 1861 it was the last place in Sicily to yield to the Sardinian (Italian) troops. The province of Messina has an area of 1246 sq. m., and a pop. (1881) of 460,924 and (1894) 518,340.

**Messina, Strait of (Lat. Mamertinum fretum, or Fretum Siculum), separates Italy from Sicily, is 24 miles in length, and varies from 2½ to 14 miles in breadth. Since 1859 a scheme for making a railway tunnel under the strait has been under discussion, but as yet it has come to no practical result. See Scylla and Charybdis.**

**Metabolism.** A general term for the chemical changes of living matter. See Function, Physiology, Protoplasm.

**Metacentre.** See Hydrostatics.

**Metallurgy.** A brief account will be given here of ancient metallurgy and of that department of modern metallurgy relating to the mechanical treatment of metals. For the specific treatment of the ores of copper, gold, iron, silver, tin, zinc, &c., see the articles on those metals.
Ancient Metallurgy.—From an ethnological point of view one of the most interesting questions connected with the origin of the industrial arts is when, and under what circumstances, man first began to work metals by softening or melting them by means of a high heat. The art of smelting ores was probably invented by observing the effect of a fire on some rich ore that happened to be in the way. Gold is always found native, and silver and copper sometimes. The ancient Egyptians worked in gold, silver, and bronze with a degree of skill that could only have been reached by long-continued practice over thousands of years. In the notes to his edition of Wilkinson's *Ancient Egyptians*, Dr Birch says that it is uncertain whether metallic tin was known to them, as Bronze (q.v.) may have been made by the use of tin ore along with copper. He also states that the question of the use of iron among them has been rendered doubtful by the few specimens of that metal found in the monuments and sepulchres. Some examples, however, have been met with, although only in one case apparently is the approximate age of the object known. It is iron wire in a bronze statute of the time of the Ramesides. In India and some other parts of Asia malleable iron is made directly from rich ores in furnaces scarcely bigger than chimney-cans, by a process in use from time immemorial; and by a similar process savages in some parts of Africa also smelt iron. It is supposed by some archaeologists that most parts of Africa passed directly from the stone to the iron age, but there seems to be evidence that in some places on that continent the making of various articles of the copper of the country has been long practised by aboriginal tribes. Among the remains found in the lake-dwellings of central Europe are crucibles for melting metals, ingots of copper and tin, and in one crucible traces of gold were found. Bronze implements are abundant, but the considerable number of copper hatchets which have now been discovered has raised the question as to whether in prehistoric times a copper age has not preceded those of bronze and iron. Copper is more easily smelted than iron; and bronze, being an alloy of copper and tin, must somewhere have been preceded in its application to hatchets or other articles by undyed copper, although this may not have been the case in Europe. Some copper hatchets, and other implements of this metal, are the only evidence we have that the ancient Mexicans made any use of metal tools; though their artificers were skilled in casting gold and silver, and in hammered work and chasing, and tin as well as copper ore was mined, and the two combined as bronze. The early tribes inhabiting the country about Lake Superior, where native copper is plentifully found, made knives and ornaments of the metal by hammering it cold, in some cases, it is believed, with stone implements. Small chisels, rings, idols, and other objects made of gold and of ancient date, some of which are of thin, flat beaten plates, have been obtained in the republic of Colombia, South America. Silver articles of a rudearchaic character appear to be rare. It is likely that the working of these native metals in the cold state in certain limited areas preceded the art of manipulating any metal by heat.

See Lubbock's *Prehistoric Times*, Manroe's *Lake-dwellings of Europe*, Nadasdoo's *Prehistoric America*, and various papers in the volumes of Contributions to Knowledge published by the Smithsonian Institution.

Modern Metallurgy.—As now understood this is the art of extracting metals from their ores. The operations are partly mechanical and partly chemical. Those processes which depend principally on chemical reactions for their results have reference chiefly to the roasting and smelting of ores, and are described under the head of the different metals. But there are certain preliminary operations of a mechanical kind which metallic ores undergo, such as crushing, jiggling, washing, &c., which we shall describe here, as they are essentially the same for the ores of lead, copper, tin, zinc, and indeed most of the metals. Until comparatively recent times, or rather ore-granite, as it came from the mine was in the first instance broken by hammers before being passed on to crushing-rollers or stamps to be reduced to smaller pieces or grains. In the year 1838 Mr E. W. Blake of New Haven, Connecticut, invented a stone or ore crusher which has become so extensively used that it has, except in special cases, superseded hand-labour for breaking up large pieces of ore. Fig. 1 shows in section a modification of Blake's ore-crusher, made by Marsden of Leeds. The shaded portion shows the fixed jaw, A, and the movable jaw, B, between which the ore or stone is crushed. To the movable jaw a rapid bitting movement (reaching 250 strokes per minute) is given by means of an eccentric lever and toggle-joints. C is the rod connecting the eccentric with the toggle-plates, DD. The machine is driven by a shaft and pulley, and has a balance-wheel. A spring or lever near the base of the machine aids the return movement of the jaw, B. The vein-stuff or impure ore is next taken either to the crushing-rollers or to the stamping-mill. Fig. 2 shows a section of a crushing-mill of German design, but nearly resembling that in use in Cornwall for treating copper, lead, and zinc ores. The ore, already reduced by the Blake jaw-crusher to
pieces roughly 14 inch in diameter, is raised to the
floor or platform, b, b, and by means of an opening
at the end passed down to the crushing rollers, r, r. These
are usually from 10 to 30 inches in diameter and at least
10 inches long, made of chilled cast-iron or steel,
and with a lever at d to keep them in posi-
tion. Below the rollers a shoot conveys the crushed ore
to a series of sieves increasing in fineness from the
first to the last and each sieve in turn is passed to the
next. Each sieve falls into a separate pit. Such pieces of
ore-stuff as are too large to go through the top
sieve or riddle fall into the raff-wheel or bucket-
wheel, and are by it raised again to the floor to be
recrushed. In Cornwall a sieve or riddle cylin-
drical in shape is used, and it slopes so that stuff
too large to go through its meshes is raised by the
raff-wheel to get a second crushing. Only about
13 per cent. of the ore-stuff crushed in the Cornish
mill exceeds 74 millimetres in size.

For pulverising some ores—tinstone and aniron-
iferous quartz, for example—a drum-mill is used.
It consists of a series of upright shafts with a
weighty piece of iron at the bottom of each. They
are raised by means of an axle with projecting
cams, and then falling by their own weight act like
hammers. Except the comminution at the first stage
these works (see GOLD), the waste grains of stuff
are generally collected—that is, the cast-iron or steel
shoes of the stamps work upon cast-iron or quartz
bottoms placed in stamped troughs filled with water.

Sizing apparatus or sorting machines are em-
ployed for the subsequent crushing of the ore-
stuff into grains of several sizes. A common hand-riddle is
the simplest form of sizing implement. One kind of
apparatus in use consists of a series of flat-bottomed
sieves with graduated meshes placed on different
levels and mechanically agitated so as to pass the
stuff through the meshes, and often by shaking back
and forth, separates the largest grains, the second the next
in size, and so on. A rotating drum-sieve or trommel
is, however, more frequently employed. It is placed
horizontally, and is to some extent conical in shape.
Sometimes it is one long continuous trommel in sections,
in which case the stuff passes through the first section, the next larger through the second,
and so on through, say, five or six divisions to the
largest grains. In other cases a system of separate
conical trommels, in which the sizing takes place
from large to small grains, is employed. With the
trommel the size is passed, although its axial
be quite level, the falling angle of its shell together
with its motion impels the ore-stuff from the smaller
to the larger end. Trommels are used for clearing
off earthy matter and for draining off water from
ore as well as for sizing.

After the ore-stuff has been sorted according to
the size of the grains, the next step is to separate
by specific gravity the pure ore from the gangue or
non-metallic minerals associated with it. If the
reduced particles be those of vein-stuff containing
more than one kind of ore, these are also separated
by gravity. If equal-sized grains of galena, blende,
and quartz, whose respective densities are 7.5, 4, and
2.7, are allowed to fall freely in some depth of water,
the three substances will separate into layers at the
bottom, in which case the lead ore (galena) will
form the uppermost layer, the silver ore (blende)
and the quartz the top layer. But in hydraulic
jiggers (some are pneumatic) the column of water,
at most under 3 inches, is too shallow to ad-
mit of separation by simply dropping the grains.
Compressed air is introduced, placed in a sieve im-
mersed in water, and supplied to a repeated up-
and-down motion, in which the ascent of the jiggering
stuff takes place by jerks, but in the descent it falls
freely. In this way the pure ore, or at least the
best ore, accumulates at the bottom, and is usually
sufficiently rich for smelting. The gangue on the
surface is skimmed off or otherwise removed.
In hand-jiggling the sieve is vigorously jerked in a
tub of water; in the brake-jigger and the jerkling
machines produced by a hand-lever and connecting rod;
and in continuous jiggers mechanical contrivances are
used to carry into different receptacles the mineral
grains separated upon the sieve in layers without
interrupting the jiggling process.

The dressing of the finely divided, or slimy ore-
stuff, which is not suitable for jigging, is effected
on baffles or sloping tables. Baffles are inclined
planes, often circular, or rather conical in shape,
over which the fine stuff suspended in water de-
escent. In doing so the heavier metallic particles
fall at the top of the table or cone while the lighter
waste is carried down to the foot.

For detailed descriptions and illustrations of ore-dressing
machines, see Hunt's British Mining (1881); an exhaus-
tive report by E. F. Althaus in the Reports of the Phi-
delphia Exhibition, 1876; and works on Metallurgy by
Rohseno-Austen (1891) and A. J. Hinn (1896).

Metal Mountains. See ERZGEBIRGE.

Metals. Although each metal is considered in
a separate article, there are various points regard-
ing the general properties of the chemical and physical
properties of these bodies, and the method of classifying
them, which require notice. A metal, from the
chemical point of view, is an element which can
replace hydrogen in an acid and thus form a salt.
Hydrogen itself is, chemically, considered to be
to be a metal. Those which are non-metallic
in this sense are called metalloides.

Amongst the chief chemical properties of metals
we notice their strong affinities to certain of the
non-metallic elements. All the metals, without ex-
ception, combine with oxygen, sulphur, and chlorine,
for example; the metals forming oxide-sulphides (formerly termed sulphurates), and chlor-
ides. Many of them combine with boron, iodine,
and fluorine. The other compounds of this nature,
excepting carbide (formerly carburet) of iron, or
steel, and the hydrides of arsenic and antimony
(commonly known as arseniuric and antimoniu-
monier hydrogen), which are of importance in toxi-
cology, may be passed over without notice. The
metallic oxides are, without exception, solid bodies,
white or coloured, and usually present an earthy
appearance—not the metallic colour and lustre
implied to these oxides. Those oxides which are
terminal basic possess the property of directly
uniting with the so-called oxy-acids (such as
sulphuric, nitric, carbonic, and silicic acid), and of
forming new chemical compounds of the second
order, termed Salts (q. v.). The compounds of
the metals with chlorine, iodine, bromine, and
fluorine—such, for instance, as chloride of sodium,
or common salt, CINa—are termed halid salts.
The same metal may often combine both with
chlorine and with oxygen in more than one pro-
portion. For example, we have subchloride of
mercury, HgCl ; suboxide of mercury, HgO ;
chloride of mercury, HgCl ; oxide of mercury,
HgO. For the compounds of the metals with
sulphur, see SULPHUR.

The following are the most important of the
physical properties of the metallic salts of the
metals, unless when they are in a finely-pulverised form,
exhibit more or less of the characteristic lustre
termed metallic. Two of the non-metallic ele-
ments, iodine and carbon, in some forms also pre-
 sent a metallic lustre. (2) All metals are good
conductors of heat and of electricity, but in very
unequal degrees. (3) With the exception of
mercury, all the metals are solid at ordinary

With the exception of gold, copper,
calcium, and strontium, the metals are,
when light is only once reflected from them,
more or less white.
with a tendency to blue or gray. Most of them have been obtained in crystals, and probably all of them are capable of crystallising under certain conditions. (4) Metals are remarkable for their opacity, except when they are chemically reduced to extremely thin films. (5) All the metals are fusible, although the temperatures at which they melt vary; the metals are very different (see Melting-Point); and some of them, as mercury, arsenic, cadmium, zinc, &c., are also volatile. (6) Great weight, or a high specific gravity, is popularly but erroneously regarded as a characteristic of a metal; while platinum, iridium, and gold (heavy, but known in nature) are more than twenty times as heavy as water. (7) Great differences are observable in the hardness, brittleness, and tenacity of metals. While potassium and sodium may be knifed with the finger, and lead may be marked by the fingernail, most of them possess a considerable degree of hardness. Antimony, arsenic, and bismuth are so brittle that they may be easily pulverised in a mortar; while others, as iron, gold, silver, and copper, require great force for their destruction. Taking iron and lead as representing the two extremes of tenacity, it is found that an iron wire will bear a weight twenty-six times as heavy as a leaden wire of the same diameter. (8) Ductility, Malleability. Metals enter into combination with one another when they are fused together, and such combination is termed an Alloy (q.v.), unless when mercury is one of the combining metals, in which case the resulting compound is termed an Amalgam (q.v.). Except in the case of the precious metals and mercury, the resulting compounds are true chemical compounds. Definite compounds of the metals with each other do, however, certainly exist, and are sometimes found native, as, for example, the crystallised silver and mercury compound represented by the formula AgHg.

In consequence of their strong affinities for the metalloids the metals are seldom found in a free or uncombined state, even in the inorganic kingdom, and never in animals or plants. The more common metals, in consequence of their strong affinity for oxygen and sulphur, are very rarely met with in the uncombined state; but some of these which are less abundant, such as gold, silver, and platinum, are found uncombined, in which case the terms native and virgin are applied to them; and other metals, as mercury and copper, occur both in a free and in a combined state. Many native alloys are found, but the ordinary sources of the metals are oxides, sulphides, chlorides, and carbonates, sulphates, and other salts. These are termed the ores of the metals. The methods of obtaining the metals from their various ores fall under the head of Metallurgy.

Various classifications of the metals have been suggested by different chemists. The following is probably one of the most convenient:

(1) The Light Metals, subdivided into—

(1) The metals of the alkalies—viz. potassium, sodium, cesium, rubidium, lithium.
(2) The metals of the alkaline earths—viz. barium, strontium, calcium, magnesium, and iron.
(3) The metals of the true earths—viz. aluminium, gallium, zincium, yttrium, erbium, terbium, thorium, cerium, lanthanum, didymium.

(11) The Heavy Metals, subdivided into—

(1) Metals whose oxides form powerful bases—viz. iron, manganese, chromium, nickel, cobalt, zinc, cadmium, lead, bismuth, copper, uranium, thorium.
(2) Metals whose oxides form weak bases or acids—viz. arsenic, antimony, titanium, tantalum, niobium (or columbium), tungsten, molybdenum, tin, vanadium, osmium.

(3) Metals whose oxides are reduced by heat—

Metal-work, Artistic. Leaving celebrated statues and groups cast in bronze to be described under the head Sculpture, we shall briefly notice here a few important examples of artistic work in metal which are rather classed as specimens of decorative art than of true sculpture. Of early cast and silver work one of the most renowned objects is the altar made of these two metals in the church of St Ambrose at Milan. It was executed by Wolvins in the 9th century, and contains figures in relief of Christ and the Apostles with the cup, the chalice, and the paten. In Italy the most famous example of work in gold and enamel is the Pala d'Oro (altar front) of St Mark's, Venice, by Byzantine artists of the 10th or 11th century. Some specimens of Celtic art, partly in precious metal, such as the Tara Brooch and the Ardagh Chalice, the latter supposed to be of the 10th century, are of exquisite beauty (see Broocit). The shrine of the Magi in Cologne Cathedral is a magnificent reliquary of the 12th century, in which the figures are of gold and the architectural decorations covered with enamels and precious stones. Certain examples of ecclesiastical gold and silver work of the 13th century remain, including a few of great interest. Of 14th-century examples—a time when the goldsmith's art ceased to be employed exclusively in the service of the church—the splendid silver reliquary in the church of Orvieto, by Ugojano of Siena, is very remarkable. Perhaps the two most important monuments of the goldsmith's art made in the middle ages are the altar of St James, Pistoia, and that of the Baptistery of St John at Florence. They were begun in the 14th century, and a number of the most famous Italian artists were in succession engaged upon them for a period of 150 years. Both are of silver, one of them being decorated with subjects from the life of St James, and the other with scenes from the life of St John. Gigliati, della Robbia, Fiocchi, Cipriano, and Filippo were among the artists engaged on the St James' altar; and Cioni, Ghiberti, Cenni, Verrocchio, and Pollaino worked at that of St John. Some of the greatest artists in Italy in the 14th and 15th centuries practised to some extent the goldsmith's art, including Luca della Robbia, Ghiberti, Bramanteschi, Donatello, and Jacopo della Quercia. In the 16th century Cellini's is the greatest name, although well-authenticated works by him in the precious metals are few in number. There are some very artistic productions in pewter by the French artist Francois Briot, who lived in the 16th century.

Bronze is a metal in which many fine works have been executed, and these are often of large size. Few early examples exist of which the artists are known. C. M. de la Planches of Constantinople, who died at Rome in the 11th century and whose name is known in the bronze gates of St Paul's, built a bridge of bronze at Constantinople, but in Rome, in 1823, but of which drawings exist. A century later an artist named Barisimus made the fine bronze door of the cathedral of Monreale in Sicily. Another famous piece of this metal of the 13th century is the candelabrum in Milan Cathedral, 15 feet high. The east door of the Baptistery at Florence,
upon which Ghirlandaio was engaged from 1425 to 1432, is considered a marvellous work of art. Another for this building by A. Visconti, completed in 1430, after being in progress for twenty years, is also an admirable production. V. Vischer's shrine of St. Sebald at Nuremberg is a beautiful monument which, though quite different in form from the objects named above, resembles them in the highest degree. Lastly, mention may be made of two other works in sculpture and architectural ornament. A fountain in the Maximilian-strasse, Augsburg, executed by H. Gerhard in 1593, has been much admired. For want of space we can only name two more bronziors—B. Morel, who did the great eavestalhurm in Seville Cathedral, and L. Bernini, who in the 17th century executed many clever works in Italy.

There is perhaps no class of metal objects in which artistic skill is more marvellously displayed than in some of the rich suits of armour made in the end of the 16th century, and especially during the 17th century. These are for the most part of iron or steel, with ornament in repoussé or engraved; sometimes with both combined, and occasionally with damascening in gold and silver. Among those who practised the armours' art in Italy the most famous names are those of N. and G. Perugino, and some members of the Piccinini family. In Germany the iron of Augsburg, and in France Antoine Jacquard stood high. Some of the finest suits of armour made at this period are in the Museum of Art in Dresden, and in the Louvre and Museum d'Artillerie, Paris.

Wrought iron work, rude but effective, appears on the wooden doors of some Romanesque churches of the 12th century. In the 13th and 14th centuries the work in this metal became more refined, and amply furnished the ecclesiastical buildings. Screens, grilles, and other objects with open wrought-iron ornament, beautifully designed, and ranging over a period from the 13th- to the 16th century, were made during the 15th and 16th, are found in many churches in Germany, Spain, France, and England. In the latter country the early grilles over Queen Eleanor's tomb, Westminster, and the early screen to Edward IV.'s at Windsor are fine examples. Some other (16th century) railing-panels made for Hampton Court Palace by Huntington Shaw. The canopy of a draw-well at Antwerp by Quentin Matsys is one of the best works of its kind in harnicerl iron. Many of the elaborately chiselled iron locks and hinges made at Nuremberg and Augsburg in the 15th and 16th centuries are wonderfully beautiful. The National Museum at Munich is especially rich in specimens of these.

Serrurier (1797); Raschdorff, Abhildunpen Deutscher Schmiedewerke (1878); Lübeke de Richard de Laloote; E. Ploen, B. Collet, Recherches sur sa Vie et sur son Oeuvre (1883); G. W. York, Metal-work (chiefly modern).

Metamorphosis, a term applied in ancient mythology to the frequent transformation of human beings into beasts, stones, trees, and even into fire, water, or the like, which are essential parts of popular folklore; and also are traced in metamorphosis, and afforded a subject to Greek poets and writers of the Alexandrine period, and to Ovid among the Romans. See BEAST-FABLES and FOLKLORE.—In Zoology the term Metamorphosis is applied to such marked changes as those from caterpillar to insect, or from tadpole to frog, where the young form or larva is strikingly different from the adult. See the articles on Amphibia, Catepillar, Crustacea, Echinodermata, Frog, Mammalia, and for Metamorphosis in Botany, see MORPHOLOGY, FLOWER.—In Geology the term metamorphism is applied to the alteration undergone by rocks under heat, pressure, and other influences, so that they assume a crystaline or semi-crystalline structure. See GEOLOGY, V. V. p. 356.

Metaphor (Gr. metaphora, 'a transference'), a figure of speech by means of which one thing is put for another which it only resembles. Thus, the Psalmist speaks of God's law as being 'a light to his feet and a lamp to his path.' The metaphor is therefore a kind of comparison implied but not formally expressed, in order to strike with greater force. Casting aside the circumlocution of the ordinary similitude, seeks to attain its end at once, by boldly identifying his illustration with the thing illustrated. It is thus of necessity, when well conceived and expressed, graphic and striking in the highest degree, and it is often a favourite figment, with poets and orators, and the makers of proverbs, in all ages. Even in ordinary language the meanings of words are in great part metaphors; as when we speak of an acute intellect, or a bold promontory. The metaphor is false if the simile involved cannot be intelligibly illustrated from experience. Those metaphors which are often called mixed metaphors, it is well that the implicit simile should be conceived objectively, as in a picture. Such cases of confusion as Cromwell's 'God has kindled a seed in this nation' are obvious enough, but most often the mixed metaphor is wrapped up in a cloud of rhetoric, as in De Quincey's sentence: 'The very recognition of these or any of them by the jurisprudence of a nation is a mortal wound to the very keystone upon which the whole vast arch of morality reposes.' Ruskin in his Praeterita, describing Rogers's cold reception of him as a boy, says: 'The cultivation of germining genius was never held by Mr Rogers to be an industry altogether delectable to genius in its zenith.'

Metaphysical Poets, a term first applied by Dr Johnson in his Life of Cowley to the group of which Donne is the most outstanding example. They were men of learning, and to show their learning off in the most refined and the most original way possible. Some of them were no doubt copyists, nature or life, hence their thoughts are often new but seldom natural; the most heterogeneous ideas are volved by violence together, nature and art being ransacked for illustrations, comparisons, and allusions; they failed, as might have been expected, in projecting the affections or stimulating the sublime, but what they wanted they endeavoured to supply by hyperbole—their amplifications had no limits, they left not only reason but fancy behind them, and produced combinations of confused magnificence that not only could not be credited but could not be imagined. Yet, if they frequently threw away their wit upon false conceptions, they likewise sometimes struck out unexpected truth: if their conceits were far-fetched, they were often worth the carriage. Such is Johnson's explanation of the phrase and its meaning, and it must be admitted that these are to a certain extent appropriate enough, for the philosophizing and analytic spirit pervades the works of the whole school, and intellect rather than emotion is ever the stuff out of which their phantasies are framed. Their conception of the tendency towards conceits and similes that are钓鱼 fantastic and ingenious, which mark a modern reader's pleasure in almost every poem of Donne and Cowley.

Metaphysics, a word first applied to a certain group of the philosophical dissertations of Aristotle, containing what Aristotle (q. v.) called 'first philosophy,' and Plato 'dialactics.' The phrase meta
ta physika means probably 'the books after the physics,' but has been interpreted 'the matters above or beyond physics.' The branch of philosophy so called is the highest department, and deals with speculative questions as to the nature and limit of human consciousness and the possibility of establishing truths beyond empirical consciousness. The term has been sometimes used, as by Mansel, to comprise Psychology along with metaphysics proper or Ontology. See PHILOSOPHY.

Metaphyta, many-celled plants, in contrast to the single-celled Protophytes.

Metastasio, the Greek form of the surname of Pietro Trapassi, an Italian poet, who was born of humble parents at Rome, on 6th January 1698. A precocious boy, he improvised verses and recited them to crowds on the street. This gift gained him a patron in his ninth year, one Gravina, a celebrated Roman lawyer, who educated him, and on his death (1718) left him his fortune. In 1722 Metastasio wrote his first libretto at Naples, which so pleased the then young singer Balgarini, called La Romanina, that she took him into her house, and launched him on his successful career as a writer of opera-libretti; libretti which possess some real poetic qualities. These dramas, all with classical subjects, were set to music by some of the greatest composers then living, as Pergolesi, Scarlatti, Durante, Hasse, Piesieli, Marcello, and others, and sung by some of the greatest singers who have ever lived, Farinelli and Caffarelli. In 1729 Metastasio was appointed court-poet to the theatre at Vienna, for which he wrote several of his best pieces. His reputation spread rapidly and stood high throughout Europe, but from 1825 to 1865 his name was anathema in Italy. He died in Vienna on 12th April 1782, having for nearly forty years suffered from 'mental and moral ennui.' Gust of his life was made to explain phenomena whose recent detection had been announced at Genoa (1802) and at Padua (1811); and his Letters were edited by Carducci (1883).

See Vernon Lee's Studies of 18th Century in Italy (1880), and Lives by Burney (1796), Mussafia (1882), and Falconi (1883), the first in English, the last in Italian.

Metaurus, a river of Central Italy, still called the Metauro or Metro, emptying into the Adriatic near Fano. On its banks the Romans defeated the Carthaginians under Hasdrubal in 207 B.C.

Metazoa, many-celled animals, in contrast to the single-celled Protozoa (q.v.).

Metellus, the name of a Roman family of the plebeian gens Cecilia, which rose to be one of the first families of the Roman nobility. One of the most distinguished members of the family was Quintus Cæcilius Metellus Macedoniensis, who received his surname from his victory over Andrius, an aspirant to the throne of Macedonia (148 B.C.). His life was considered by ancient writers as an example of the greatest felicity: before his death in 113 five of his sons had been consuls, one censor, and one a candidate for the consulsip. Another was Quintus Cæcilius Metellus Numidicus, who twice defeated Jugurtha in Numidia and was afterwards impeled for his integrity of character, but was superseded in his command by Marius. His son, Quintus Cæcilius Metellus, surnamed Pius, joined Sulla in 83 B.C., but sought to moderate the severity of his proceedings, which obliged him to conquer Crete, and reduced it to a Roman province (67 B.C.). Quintus Cæcilius Metellus Pius Scipio, sometimes called Quintus Scipio, and some-
times Scipio Metellus, was a son of Scipio Nasica, who was adopted by one of the Metelli, and became the father-in-law of Pompey, and his zealous partisan. He commanded the centre at Pharsalia, maintained war on his behalf for some time in Africa, and, after the battle of Thapsus (46 B.C.), died by his own hand.

Metempsychosis. See TRANSPLACEMENT.

Meteorology (Gr. metéora, 'meteors, or atmospheric phenomena') was originally applied to the consideration of all appearances in the sky, both astronomical and atmospheric; but the term has now confined to that department of physics which treats of the phenomena of the atmosphere as regards weather and climate. Owing to the complexity of the phenomena, meteorology is the most difficult and involved of the sciences, and may seem, at first sight, almost incapable of being reduced to a science at all. On this account, the only procedure admissible in the first place is a faithful recording of facts by long and patient observation.

From the nature of the subjects which make up the science, it may be inferred that they occupied men's minds from a remote antiquity. From the time spent in the open air in the early ages, and from the imperfect protection afforded against the inclemency of the seasons, those appearances which experience proved to precede a change of weather would be eagerly recorded and handed down. In this way many valuable facts were ascertained and passed current from hand to hand; and perhaps there is no science of which more of the leading facts were inferred before being incorporated into popular language. Aristotle was the first who collected, in his work On Meteors, the current prognostics of the weather. Some of these were derived from the Egyptians, while a considerable number were the result of his own observation. Theophrastus, one of Aristotle's pupils, classified the opinions commonly received regarding the weather under four heads—viz. the prognostics of rain, of wind, of storm, and of fine weather. The subject was discussed only in its popular and practical bearings, and no attempt was made in Italy to explain phenomena whose occurrence appeared so irregular and capricious; but still the treatise of Theophrastus contains about all that was known down to comparatively recent times. No real progress was made till instruments were invented capable of giving with regard to the temperature, the pressure, the humidity, the purity, and the electricity of the air. The discovery of the weight or pressure of the atmosphere made by Torricelli in 1643 was undoubtedly the first step in the progress of meteorology to the rank of a science. As this memorable discovery discloses what passes in the more elevated regions of the atmosphere, it follows that the elevations and depressions of the barometric column largely extend our knowledge of the subject. Indeed, nearly all of the more important of the discoveries of modern meteorology have been made through the barometric observations.

The invention and gradual perfecting of the thermometer in the same century formed another capital advance; as without it nothing beyond vague impressions could be obtained of the most important of all the elements of climate. Fahrenheit constructed small and portable thermometers, which, being carried by medical men and travellers over every part of the world, furnished observations of the most valuable descriptions. C. C. C. Geissler's separation of different countries became known, and the exaggerated accounts of travellers with regard to extreme heat and cold were reduced
to their proper significance. Scarcely less important was the introduction of the hygrometer, first systematically used by De Saussure (died 1799), and subsequently improved by Dalton, Daniell, and others. The invention of these instruments the number of meteorological observers greatly increased, and a large body of well-authenticated facts of real value was collected. The climates of particular parts of the earth were approximately determined, and the scientific and practical advantages by the investigations into the laws which regulate the changes of atmospheric phenomena.

The theory of the trade winds was first pronounced by George Hadley in the Philosophical Transactions for 1735; and it may be mentioned as a remarkable fact that for about half a century it remained unnoticed, and then was independently arrived at by Dalton. The publication of Dalton's Meteorological Essays, in 1793, marks an epoch in meteorology. It is the first instance of the principles of science being brought to bear on the explanation of the intricate phenomena of the atmosphere. The idea that vapour is an independent elastic fluid, and that all elastic fluids, whether alone or mixed, exist independently; the great principles of motion of the atmosphere; the phenomena of the effect of the thermometer on their relation to temperature and time; observations on the height of clouds, on thunder, and on meteors; and the relations of magnetism and the aurora borealis—these are some of the important questions discussed in these remarkable essays, with singular accuracy and helpfulness.

One of the most interesting and fruitful subjects of inquiry that engaged the attention of meteorologists was dew. The observations on this subject were first collected and reduced by Dr Wells, and the theory be advanced, supplemented by the recent researches of Sir John Aikin, gave a complete explanation of the phenomenon (see Dew).

In 1823 Daniell published his Meteorological Essays and Observations, which, while adding largely to our knowledge in almost every department of the subject, are chiefly valuable as bearing on effects of the air. This apparatus gives the practical advantages which he anticipated to flow from it have not been realised, yet this difficult department of meteorology still stands indebted to him perhaps more than to any other philosopher of the diffusion of the atmospheric vapour through the air, its influence on the barometric pressure, and its relations to the other constituents of the atmosphere are among the least satisfactorily determined questions in meteorology. Since this element is so important in originating changes of weather and as an indicator of storms, and since so much remains still to be achieved, it is to be hoped that it will soon be more thoroughly investigated, particularly in its relations to solar and terrestrial radiation. As the humidity to some extent obstructs solar and terrestrial radiation, it follows that the growth of each province of aqueous vapour the extremes of heat and cold would be so intense and insufferable that all life would perish, as there would be no screen shielding the earth from the searching heat of the sun by day, and from the equally searching and blinding effects of the cold nights.

Electrical observations have been, of all meteorological observations, perhaps the least productive of results advancing the science, partly owing to their want of precision, and from the expense and trouble attending them. Humboldt's treatise on Isothermal Lines (1817) constitutes a notable epoch in practical meteorology. Davy and, more recently, the present writer have continued the investigation, and given charts of the world, showing the temperature for each month and for the year. In 1868 another series of important charts were published by the writer, showing, by isolatic lines, the more or less uniform temperature of the atmosphere, and by arrows the prevailing winds over the globe for the months and the year. These charts, since revised by him, and published in one of the Challenger reports, show the movements of the atmosphere and their immediate results. It is thus seen that the prevailing winds are the simple result of the relative distribution of the mass of the earth's atmosphere; or that the direction and force of the prevailing winds are simply the flow of the air from a region of higher towards a region of lower pressure, or from where there is surplus to where there is a deficiency of air. On this broad and vital principle meteorology rests, and it is of universal application throughout the science in explanation not only of prevailing winds, but of all winds, and of weather and weather changes generally. Further, it supplies the key to the climatologies of the globe; for climate is determined by the temperature and moisture of the air, and these in their turn by the prevailing winds. In 1882 Loomis published a map representing in colours the mean rainfall of the globe. This map and others that have followed have shown that the rainfall is everywhere determined by the prevailing winds, considered with respect to the regions from which they have immediately come, and the physical configuration and temperature of the part of the earth's surface over which they move. Thus, the highest rainfall is found with winds which, having traversed a large breadth of ocean, come up against and blow over a high ridge lying across their path: and the amount is still further increased if the winds pass at the same time into regions the temperature of which constantly becomes colder. Of this the winter rains of north-western Europe and the summer rains of Japan are good examples. On the other hand, the rainfall is very small, or nil, where the prevailing winds have not previously traversed some extent of ocean, but have crossed a high ridge and are descending into lower latitudes, or into regions the temperature of which is markedly higher. Good examples of this are the summer rains of California and adjoining regions, and those of the Indus valley.

The development of meteorological societies during the last half of the 19th century must also be commemo-rated as contributing in a high degree to the solid advancement of the science which, more than any other, must depend on extensive and carefully conducted observation. A special object of meteorological societies is to ascertain the degrees of temperature and moisture in various localities, and the usual periods of their occurrence, together with their effects on the health of the people and on the different agricultural products; so that, by a knowledge of the laws by which the growth of each product is determined, it may be ascertained with some degree of certainty whether any given article can be profitably cultivated. But perhaps none of the arts have benefited to so large an extent by the results arrived at by meteorologists as navigation. The knowledge thus acquired, as to the direction of the prevailing winds over different parts of the earth during the different seasons of the year, the regions of storms and calms, and the laws of storms has both saved innumerable lives, and, by pointing out the most expeditious routes to be followed, shortened voyages to a remarkable degree. In the departments of science of Maury (q.v.) deserves special commendation. Another fruit of the multiplication of meteorological stations is the prediction of storms and
"forecasts" of weather, first suggested in the United States about the middle of the 19th century. As regards the British Islands these "forecasts" are based on telegrams which are received every morning from about sixty selected stations in Great Britain and Ireland, and on the Continent, which give the exact state of the atmosphere over the country. From these telegrams, the weather, teni-

censes is thus to these seen but the likely representation only to magnificent or the prob-

the the the the the lat., P.M., the On to this regards the the

inng rage, will be isotlieriiials the Atlantic, vuiictil to meteorology. the temperature of the sea does not vary during the day quite so much as one degree Fahrenheit. Off the coast of Scotland this variation may amount to 10°, in the bottom, the water has a considerable daily range of temperature. Thus, in mid-ocean, from 30° N. lat. to 30° S. lat., the temperature of the surface of the sea does not vary during the day quite so much as one degree Fahrenheit.

regarding the possible phenomena of the important principles of the science are based. Of the sun's rays which arrive at the earth's surface, those which fall on the land are wholly absorbed by the the ocean surface, the temperature of which conseq-

quences rises. A wave of heat is thence propagated downward through the soil, the intensity of which rapidly lessens with the depth at a rate depending on the conductivity of the soil, till at a depth of about 4 feet it ceases to be measurable. Part of the heat of this surface layer is conveyed upwards into the atmosphere by convection currents. But as regards the surface of the ocean the case is totally different. Here comparatively little of the heat is absorbed at the surface, but it penetrates, as shown by the observations of the Challenger expedition, to a depth of about 500 feet. Hence in deep waters the temperature of the surface is but little heated by the direct rays of the sun, though in shallow water, especially near the coast, on the bottom, the water has a considerable daily range of temperature. Thus, in mid-ocean, from 30° N. lat. to 30° S. lat., the temperature of the surface of the sea does not vary during the day quite so much as one degree Fahrenheit.
METEOROLOGY

It has been further shown from the Challenger observations that the force of the winds on the open sea is subject to no distinct and uniform diurnal

by.

Meteors ex small bodies travelling in vast numbers to various distances through space. Our earth continually encounters them in its orbital path, and they are then revealed to our observation as aerolites, fireballs, and shooting or falling stars. Every night, if the sky be clear, some may be observed, on the average five to seven every hour, while on certain occasions there are so numerous as to present the spectacle of a perfect rain of fire. Besides those visible to the eye, there are numbers unseen, some of which are occasionally noted in the course of telescopic observation. The total number encountered by the earth in one day does not exceed five or six, according to Professor Newton, of Yale College, United States, at 7,500,000. Their total mass, however, he estimates at only 100 tons, so that individually they must in general be exceedingly minute. They dissipate, however, a quantity of dust in the upper regions of the air, which in its slow descent and fall upon the earth is easily detected by proper means. Our air in this case acts as a shield, so that, instead of frequent showers of stones descending with deadly force, we have this quiet falling of impalpable dust.

Our conclusions regarding meteors are reached by a proper interpretation of various phenomena, which, although long considered as having no mutual connection, have now grouped coherently under one simple explanation. In order to appreciate the reasoning which has led to this result, it will be convenient to consider first the observed facts regarding (1) aerolites, (2) fireballs, and (3) shooting stars.

The first group, aerolites, includes all stony or metallic masses actually falling to the earth from the sky. They have been classed as (1) siderolites, or siderites, chiefly consisting of meteoric iron; (2) aerolites, or siderolites, conglomerates of meteoric iron and various kinds of stony material, generally consisting of stone. The common title aerolites embraces, however, all kinds. The descent of such bodies, though rare, has occurred with greater frequency than would be imagined. The British Museum alone has specimens of more than three hundred, of which nearly two hundred were seen to fall. Some sacred stones, as the black stone worshipped at Enesa in Syria, the holy Kaaba of Mecca, and the great stone of the pyramid of Cheops in Mexico, owed their sanctity to a report, probably true, that they fell down from heaven. It has been suggested that the earliest image of Diana of the Ephesians, which 'fell down from Jupiter,' had taken the place of an actual meteorite. Livy mentions the falling of a shower of stones on the Alban Mount near Rome, about 654 B.C. A Chinese catalogue records the fall of an aerolite on January 14, 1916 B.C., which broke several chariots and killed ten men. Plutarch and Pliny mention a great stone, as large as a wagon, the latter says, and of a burnt colour, the fall of which, at Agospotamos on the Hellespont about 437 B.C., is recorded in the Parian Chronicle. In 1492 A.D., 'on Wednesday, November 7,' a stone weighing 260 lb. was seen to fall near Einsheim in Alsace: part of it is still preserved in the village church there. In 1510 about 1200 stones, one weighing 210 lb., another 60 lb., fell near Padua in Italy. We are told that the Emperor Tiberius had the Emporer's sword to be forged from a mass of meteoric iron which fell at Jullunder in the Punjab in 1629. On November 27, 1927, the astronomer Gassendi witnessed the fall of a stone weighing 59 lb. at Mount Etna in Sicily. At Wold Cottage, Yorkshire, December 13, 1920, a stone weighing 56 lb. weight fell near him in a field. But the most interesting of such modern observations was made on April 26, 1801, near L'Aigle, in Normandy. About 1 p.m. a brilliant fireball was seen traversing the air at a great speed. Violent
explosions followed, apparently proceeding from a small and lofty cloud, followed by a shower of thousands of stones, one 8 lb. in weight. A large meteorite exploded with prodigious noise over Madrid on 10th February 1896. On April 20, 1876, a mass of meteoric iron more than 7 lb. weight fell at Rowton in Shropshire, accompanied by a shower of fragments. On a night in August 4, 1887, a large aerolite fell at Krasnoslobodsk, in the government of Penza. It was accompanied by a loud explosion, and in it (as in some others) were found crystals having all the chemical properties of iron. It is as good as demonstrated that these and other cases are noticed the following features—a noise, often an explosion; (2) cloud or smoke; (3) partial fusion of the mass or masses, especially on the surface. These indicate that the aerolite has been by a very high temperature, at least above the melting-point of iron, which often causes it to burst into fragments. Pieces of which fell in India in 1851, though picked up miles apart, were found by Maskelyne to fit together into one whole, the fractures coinciding. This high temperature, on the surface of the mass, would cause a vapour to form, which would give off a cloud of the air in the case of a body moving with sufficient velocity. There is no observed connection between aerolites and volcanoes, nor can volcanic agencies account for their velocity, and so this simple explanation of aerial friction is now universally accepted. It is equally easy to understand how when we consider aerolites as simply fireballs whose mass and course are such as to bring them entirely through our atmosphere into contact with the earth. Meteoric iron is also alloyed with nickel, cobalt, manganese, magnesium, copper, carbon, and tin, in various proportions, and is not unlike some of the terrestrial minerals; and this also points to its chemical origin. Altogether twenty-four of the terrestrial chemical elements have been found in aerolites—viz. oxygen, hydrogen, chlorine, sulphur, phosphorus, carbon, silicon, iron, nickel, cobalt, magnesium, chromium, manganese, antimony, aluminium, calcium, potassium, sodium, lithium, titanium, arsenic, and vanadium. No new element not found on earth has been found in them.

The second class of meteors form fireballs, which appear as brilliantly luminous bodies, traversing the sky, often with noise, and always with great velocity. Aerolites before their fall have often been seen as fireballs, and the substantial unity of the two classes is now almost universally accepted. Fireballs, whilst traversing the air, differ in appearance from earth or sea, at a height of 50 miles and with a speed of 30 miles per second, giving off a greater light than the full moon. More recently, on November 17, 1887, a splendid specimen, seen first over the Irish Sea, crossed Bremen, and that night at Hamburgh, at a height of probably about 20 miles, and disappeared above the Atlantic. Many hundreds of such, though usually less brilliant, have been observed. Arago enumerates 813. More are constantly being seen. Their height is obtained by comparison of observations at stations which are 120 miles apart, and from the observed speed the actual velocity is computed. From a careful comparison of many observations made by a committee of the British Association it appears that in general they appear at a height of between 20 and 130 miles, and have a velocity of between 20 and 80 miles per second, with an average of 34'4 miles per second. Their actual size has been enormously overestimated, at 12,000 to 100 feet in diameter. The effects of irradiation and the luminous gases discharged during their course no doubt give them an apparent diameter enormously greater than the reality. It is probable that in most cases they are much smaller than aerolites. They generally leave behind them in their track and are occasionally accompanied by a noise that disappears at once, and at other times persists for some minutes after the fireball itself disappears. These 'tails' are variously coloured, according probably to the different chemical constitution of the bodies.

That these bodies originate altogether beyond our earth is evident from several considerations. First, no sufficient terrestrial cause has been assigned. It has never been shown that volcanic explosions can communicate to ejected masses the necessary velocity. No proof has been advanced of the theory that aerolites and fireballs are condensed in the atmosphere itself. There is no volcanic activity on the moon, which might project such masses beyond the influence of her feeble gravity so as to enable them to fall upon our earth. Even if they were able to pass through the atmosphere with the velocity of projection required it is so great as to place such a cause outside consideration. Secondly, no good reason can be advanced against the theory of comical origin. That numerous masses, of various sizes, are in motion through interplanetary space is now almost universally admitted, and many are commonly observed when we consider aerolites as simply fireballs whose mass and course are such as to bring them entirely through our atmosphere into contact with the earth. Velocity, averaging 34'4 miles per second, is only comparable with such velocities as that of the earth in its orbit, which is 18'2 miles per second, or of Sirius (see STARS), or of the meteoric showers, and stars. It is a velocity not on the terrestrial but on the cosmical scale. Fourthly, there is no special line to be drawn between fireballs and meteors, luminous bodies of all degrees of size between the smallest meteor and the fireball having been observed by many, and even their origin is not in doubt to the observer to which class he should relegate an observed example. To regard all as of common extra-terrestrial origin is then reasonable, and this view is now adopted almost universally.

We are to turn towards the phenomenon of shooting-stars, as both the most numerous class of these appearances, and that class by observing which a satisfactory explanation of them all has ultimately been reached. On any fine night a watcher who is careful and patient for a sufficient time will see some of these, but occasionally they are much more numerous. On these occasions they are noted as originating all in one or more distinctly marked parts of the sky. From their point of origin they appear to radiate, and if it be overhead, and the meteors very numerous, the appearance is like an 'umbrella of fire' above the earth. But this point may not be overhead. It may even be below the horizon. In the latter case the meteors appear to come up over the horizon like rockets and ascend into the sky. This 'radiant,' as it is technically called, remains fixed among the stars, so that if at the beginning of an observation it be overhead, it will perhaps be below the horizon before the observer ceases his work. It is either named from the constellation in which it is placed, or indicated by its north polar distance. It is usual to observe that the apparent motion of the meteor is, like that of the radiant, due to the apparent motion of the earth, so that the meteor appears to ascend or descend in the sky, and the radiant fixed. Meteors from more than one radiant are frequently passing at the same time, but usually each radiant sends forth a particular kind. Leonids (i.e. the meteor whose radiant is in Leo), or the famous November meteors, are bright and swift, leaving very durable trains of light. The Taurids (from constellation Taurus) give us many fireballs. Other

assemblies of co-pastors, exercising mutual discipline and taking mutual counsel on all subjects specifically pastoral, and in part an assembly of 240 ministers and 240 laymen convened to deliberate on the general interests of the Connection. The pastoral session consists of three weeks, while the mixed session finishes its business in a week. 'The legal Conference' is a body of one hundred ministers constituted and perpetuated by Wesley's Deed of Declaration, which as a matter of necessary legal form adopts and endorses all that has been done by the General Conference.

Intermediate between the Conference and the circuit are the district meetings, which are in effect provincial synods. Like the Conference itself, during the transaction of pastoral business they are composed of ministers only, while for all other business they are mixed assemblies, the ministers being joined by the circuit stewards and the laymen who have charge of foreign missions, home missions, education, chapel, and temperance affairs. In the district meeting a searching inquiry is made by the pastors into the character and administration of every society, whether of the Wesleyan or of the Primitive Method. Every society that can find a person who is willing to do what God requires of them to be done at one of the circuit, and pay them over to the 'stewards' of the society. Each society has its stewards, who take charge of the moneys contributed in the classes and congregation, and whoever to their proper distribution. The leaders and stewards of each circuit are elected; the circuit-stewards being invested with disciplinary functions. A circuit is an aggregate of the societies for a particular neighborhood; and, according to its size, having from one to five ministers appointed for a period of not less than one or more than three years. The senior minister is superintendent of the circuit. The administration of the spiritual affairs of each society is vested in the leaders' meeting, and that of the general business of the circuit in the quarterly meeting, composed of the ministers, stewards, local preachers, leaders, and trustees. These bodies invite the ministers, fix their stipends, appoint and reject candidates for the ministry, review all the interests of the circuit, send memorials to the district meeting or Conference, have the right to appoint a court of appeal from the findings and verdicts of the superintendency, be consulted on discipline, and to suspend for one year the operation of any new Conference law intended to be binding on the circuit or societies, until it shall have been reconsidered by the Conference. The annual assembly which governs the whole Connection is called the Conference, and Wesley's preachers as he chose to call together to take counsel with himself; but in that year he gave it a legal constitution defining its rights over the chapels, the disciplinary control of the ministers and tithe holders, his dispensation to it as the head of the church. It is so organized that the Conference was composed of ministers only; but in that year a scheme of lay representation was adopted, and was brought into operation the year following. So now the Conference is in part an assembly of co-pastors, exercising mutual discipline and taking mutual counsel on all subjects specifically pastoral, and in part an assembly of 240 ministers and 240 laymen convened to deliberate on the general interests of the Connection. The pastoral session consists of three weeks, while the mixed session finishes its business in a week. 'The legal Conference' is a body of one hundred ministers constituted and perpetuated by Wesley's Deed of Declaration, which as a matter of necessary legal form adopts and endorses all that has been done by the General Conference.
that 'Christian perfection does not imply an exemption from ignorance or mistake, infirmities or temptations; but it implies the being so crucified with Christ as to be able to testify, ' I live not, but Christ liveth in me.' He regards the 'person' of the 'Methodists' as 'invariable transgressions,' and does not think they should be called 'sins' at all, though he admits that they need the atoning blood of Christ. The mode of worship is elastic, ranging from the full and stately liturgical service of the Church of England, and Wesley's abridgment, to the more primitive observances of extempore prayer, the singing of four hymns, and a sermon. The more elaborate services are found principally in the large cities, the more simple in the country towns and villages. The 'love-feast' is for members only, and is held in each society once a quarter; it is a narration of vivid and inspiring experience, mingled with praise and prayer. The Covenant Service is held on the first Sabbath of the New Year. In this service the members of the church solemnly reconstitute themselves to God, 'heartily contending that He appear them their way and station,' covenanting to endeavour to order and govern their whole life according to the divine direction, and not to allow themselves in the neglect of anything they know to be their duty. The service concludes with the Lord's Supper.

The Methodist Church has for many years the history of Christian effort to evangelise the neglected 'masses' of England. The labours of Wesley, and of those whom he inspired to imitate his example, were of the noblest description, and met with remarkable success. The refashioning of life which was the result of the preaching of the gospel, for example, among the Kingswood colliers and the Cornwall wreckers, is a testimony to the power of religion which cannot be too highly estimated. The zeal which has inspired the body in regard to foreign missions, although its origin and inception is only the logical development of their efforts at home—for they originally regarded their society in England as simply a vast 'home mission,' and neither Wesley nor his followers desired to consider themselves a 'sect,' a new church, in the common understanding of that word—has steadily increased, and is now a recognized and important branch of the work of the church. There was a movement, which lasted several years, to found an all-British society, and consider themselves among her true children. When Wesley died (1791) his 'societies' had spread over the United Kingdom, the continent of Europe, the States of America, and the West Indies, and numbered 80,000 members, whereas then they have largely increased (see below).

The Wesleyan Methodists have four theological colleges for the training of ministers—at Richmond Hill, Surrey; Didsbury, South Lancashire; Headingley, in Yorkshire; and Handsworth, Birmingham. They have, besides, numerous secondary schools, and also (in 1889) 841 day-schools, with 179,678 scholars; the total income of the schools being £240,478. The Methodist Book-room is situated in the City Road, London, and issues hundreds of thousands of religious publications (tracts, &c., monthly). The newspapers and other periodicals professionally in connection with the body include four quarterlies, and about 150 journals in English and other languages. Among the more eminent Methodist authors may be named the two Wesleys, Philip, John and Charles,8 their works were translated into ten languages. Dr. Edmundson, Sutcliffe, Jackson, Trevett, Rule, Nichol, Smith, Etheridge, Rigg, Pope, Gregory, Beck, and Pearson.

The METHODIST EPISCOPAL CHURCH is the society of Wesleyan Methodists in the United States of America, where the first members of that body—immigrants from Ireland—established themselves as a religious society in New York in the year 1766. In the course of a year or two their numbers had considerably increased, and they wrote to John Wesley to send them out some competent preachers. Two immediately offered themselves for the work, Richard Boardman and Joseph Pilmoor, who were ultimately joined by the Rev. Richard Wright. The agitation preceding the war of independence, which soon afterwards broke out, interrupted the labours of the English Methodist preachers in America, all of whom, with the exception of Asbury, returned home before the close of the year 1777. The American church had been supplied by others of native origin, and they continued to prosper, so that at the termination of the revolutionary struggle they numbered 43 preachers and 13,740 members. Up to this time the American Wesleyan Methodists had held no claim to being a distinct religious organisation. Like Wesley himself, they regarded themselves as members of the English Episcopal Church, or rather that branch of it then existing in America, and their 'preachers' as a body of irregular auxiliaries to the ordained clergy. 'Episcopal churches,' we are informed, 'are still standing in New York and elsewhere, at whose altars Embury, Pilmoor, Boardman, Strawbridge, Asbury, and Rankin, the earliest Methodist preachers, received the holy communion.' But the recognition of the United States as an independent country, and the difference of feelings and interests that necessitated the admission of new denomina-
tions at home and those in America, rendered the formation of an independent society inevitable.

Wesley became conscious of this, and met the emergency in a manner as bold as it was unexpected. He named William Asbury, one of his preachers, appointed Asbury coadjutor bishop, and ordained several preachers to the offices of deacon and elder. Wesley also granted the preachers permission (which shows the extensive ecclesiastical power he wielded) to organise a separate and independent church under the government. Nevertheless, there were not a few who were dissatisfied with the Episcopal form of government. This feeling grew stronger and stronger, until in 1800 a secession took place, and a new ecclesiastical organisation was formed, called the 'Methodist Protestant Church.' In 1812 a second secession took place, chiefly on the question of slavery—the seceders pronouncing all slave-holding sinful, and excluding slaveholders from church membership and Christian fellowship; and in 1843 a meeting was held at Utica, New York, where a new society was constituted and named the 'Wesleyan Methodist Connection of America.' It has continued up to the present a small and unimportant body. But in 1844 a far larger and more important secession took place on the slavery question, and the Methodist societies in the then slave-holding states, conceiving themselves aggrieved by the proceedings instituted at the general Conference of New York (1844) against the Rev. James O. Andrew, D.D., one of the bishops, and a citizen of Georgia, who had married a church un faithful of slaves, and had break off connection with their northern brethren. Hence originated the Methodist Episcopal Church, South. In 1869 a movement (unsuccessful) began.
METHODISTS

in favour of the re-union of the northern and southern Methodist Episcopal Churches, slavery, the main obstacle in the way, having been finally abolished. There are now 10 theological schools, including 6 universities, and a great number of other educational institutions belonging to the body in America, with some 30,000 students. The publications of the church, managed by a General Book Committee, extend to far above 200,000,000 pages of books and tracts in a year; while its foreign missions alone exceed 3000 American missionaries are employed.

Returning to the English Wesleyan Methodists, we mention the various secessions from the parent body in the order of time. (1) The Methodist New Connexion, a small society detached itself from the older body in 1797. Its doctrines and order are the same, the only difference being that it admits one layman to each minister into the Conference, and allows them to share in the transaction of all business, both secular and spiritual. These laymen are chosen either by the circuits or by 'guaridan representatives' elected for the life by the Conference. (2) Primitive Methodists, vulgarly designated Ranters, were first formed into a society in 1810, though the founders had separated from the old society some years before. The immediate cause of the secession was the demand for the propriety of camp-meetings for religious purposes; and also upon the question of women being permitted to preach. A third point of difference is the admission to their conference of two lay delegates for every meeting. (3) Independent Methodists, which separated in 1810. They are chiefly distinguished by their rejection of a paid ministry. (4) Bible Christians, also called Brynmawr, were formed by a local preacher named Bryan, who seceded from the Wesleyans in 1815. The only distinction between them and the original body appears to be that the former receive the eucharistic elements in a sitting posture. (5) United Free Church Methodists have been formed by the amalgamation of two sects of nearly equal numerical strength. The older of these, called the Wesleyan Association, originated in the removal of the influence of two influential ministers from the original Connection. Points of difference subsequently appeared with regard to the constitution of the Conference. — The younger sect, called the Wesleyan Reform Association, came into being through the demands of several ministers from the parent body on a charge of insubordination, and, being founded on the same principles as the last-mentioned community, arrangements were entered into for their union, which was subsequently effected in 1857.

Church independence and freedom of representation in the annual assembly are two of the most prominent distinctive traits in the organisation of the United Methodist Free Church.

The Welsh Calvinistic Methodists are not a sect as defined in this history, but a movement, associated partly in the preaching of his friend and fellow-evangelist, Whitefield, and partly in that of Howell Harris. Whitefield was a Calvinist; Wesley, as we have seen, was on some points decidedly Arminian. A difference arose between them on the subject of election. Henceforward their paths lay in different directions. Whitefield, however, did not form a religious sect; and after his death (1770) his followers, being left without any distinct bond or organisation, either followed the leading of the Countess of Huntingdon, (q.v.), or became distributed among other denominations. A large portion especially in Wales, becoming absorbed in the new society gradually forming itself through the preaching of Howell Harris and his coadjutors. They became a separate body in 1810, and in have now about 130,000 communicants.

METHODISTS

The total number of members and adherents of Methodist churches is estimated at 25,000,000; the following table shows the distribution of members and groups in 1889-91:

<table>

For Methodist missions, see Missions.

Methodism. See Cyril.

Methoden Treaty, a commercial treaty negotiated in 1703 by Paul Methuen, the English ambassador in Portugal, with that country, to admit it to the consumption of English wines at a duty of less than that on French wines, the Portuguese undertaking in return to admit English wool, imposing on it, however, the old duty of 23 per cent. ad valorum. It was annulled in 1835.

Methyl is an organic radical homologous with Ethyl (q.v.). Its formula is CH₃, but, as it cannot exist in the free state, two such groups of atoms unite together to form ethane, CH₃—CH₃. As in the case of ethyl, methyl is the centre of a whole group of substances known as the methyl-group. Thus, the hydride of methyl, CH₃H, known as light carburetted hydrogen, marsh-gas, or fire-gas, is well known as the cause of explosions in coal-mines. It is a light, inodorous gas, half as heavy as air; non-poisonous and very inflammable, forming an explosive mixture with seven volumes of air. Methyl alcohol, CH₃OH, is obtained as a by-product in the manufacture of beet-root sugar, and also by the distillation of wood. It is a colourless, liquid, resembling ordinary alcohol in many of its properties. Methyl oxide or methyl ether, (CH₃)₂O, corresponding to ethyl ether or common ether, is a gas at ordinary temperatures, very soluble in water and alcohol, and capable of being condensed to a liquid by pressure and cold. It is largely prepared for use in freezing-machines, owing to the intense cold which results when the liquefied gas is allowed to evaporate. It is prepared by the action of sulphuric acid on wood spirit.
Methylated Spirit

Besides the above, methyl enters into the constitution of many ethereal salts and amines, such as methyl chloride, dimethyl amine, and salicylate, as well as methylamine, dimethyl amine, &c. (see Amines). The salicylate, CH₂C₆H₅O₆, is interesting as being the ethereal oil of Gaultheria procumbens, from which pure methyl alcohol and pulegolic acid can both be made. For Methyl Violet, see Dyestuff; and for Methylene, see ANESTHESIA.

Methylated Spirit consists of a mixture of 9 parts of alcohol of specific gravity 0·920, with 1 part of Pyroxyline (q.v.) or wood-spirit. This addition of wood-spirit renders it unfit for drinking, although it scarcely interferes with its power as a solvent. It is allowed by the excise to be sold duty-free for manufacturing purposes, and for preserving specimens in museums.

Metonic Cycle. See Chronology, Golden Number.

Metope. See Entablature.

Metre is that regulated succession of certain groups of syllables in which Poetry (q.v.) is usually written. A greater or less number of such groups forms a line or a metrical foot in modern languages the verses usually rhyme with one another; but this is not at all essential to the notion of metre. In the classic languages metre depended upon the way in which long and short syllables were made to succeed one another. English metre depends, not upon the distinction of long and short, but upon that of accented and unaccented syllables. Thus in the lines,

The curfew tolls! the knell of parting day
Warriors and chiefs, should the shaft or the sword
the accents occur at regular intervals; and the groups of syllables thus formed constitute each a metre or measure. The groups of long and short syllables composing the metres of classic verse were called feet, each foot having a distinctive name. The same names are sometimes applied to English measures, an accented syllable in English being held to be equivalent to a long syllable in Latin or Greek, and an unaccented syllable to a short. Every metre in English contains one accented syllable and either one or two unaccented syllables. As the accent may be on the first, second, or third syllable of the group, there thus arise five distinct measures, two disyllable and three trisyllable, as seen in the words, conformable to the classic Trochee; 2, agree' (Ianbus); 3, mirr'mur'ring (Duets); 4, confu'sion (Amphibrach); 5, col'manade' (Anapest). These measures are arranged in lines or verses, varying in length in different pieces, and often in the same piece. The ending measure of a line is frequently incomplete, or has a supernumerary syllable; and sometimes one measure is substituted for another. All that is necessary is that some one measure be so predominant as to give a character to the verse. Constant recurrence of the same measure produces monotony. The following lines exemplify the five measures:

Rich the | treasure
Better | six ty | year's | of | Euro pe | than |a | cy le | of | Ca thy.
Aloff' | in | aw ful | state.
The pro per | sty la' |y | of | man kin d | is | man.
Bird of | the | wilderness.
Bright and | best | of | the | sons | of | the | morn ing.
The dew' of | the | morn ing.
O young' Loch | jvar | has | come out' | of | the | west.
As they | run | on | shore.
The Am yr' has gone | down' | like | a | wolf | on | the | ford.

It is instinctively felt that some of these measures are better suited for particular subjects than others.

Thus, the first has a brisk, abrupt, energetic character, appropriate well with lively and gay subjects, and also with the intensity of such pieces as Scott's Rea ha'. The second is by far the most usual metre in English poetry; it occurs, in fact, most frequently in the ordinary prose-movement of the language. It is smooth, graceful, and stately; readily adapting itself to easy narrative, and the expression of the gentler feelings, or to the treatment of severe and sublime subjects. The trisyllabic metres, owing to the number of unaccented syllables in them, are rapid in their movement, with a tripping lightness that suggests the analogy of music of different time. They are still less regular and monotonous than the disyllabic metres. One of them is frequently substituted for another, as in the opening of Byron's Bride of Abydos:

Know ye the land where the Cypress and myrrh Are emblems of grief's that are done in their time, Where the rage of the vain' ture, the love of the tur | tie| where each of the three lines is in a different metre, the first daecyle, the second amphibrachie, the third anapastie. In addition to this irregularity, one of the unaccented syllables is often wanting; as in Mrs. Hemans' poem, The Voice of Spring:

I come', I come! I ye have called' me long;
I come', I come! my name' is on my tongue—
the first line has only one measure of three syllables, although the general character of the versification is trisyllabic.

In a kind of verse introduced by Coleridge, and used occasionally by Byron and others, the unaccented syllables are altogether left out of account, and the prosodization is made to depend upon having a regular number of accents in the line:

There is not wind' enough' to twist
The one red leaf, the last' of its clan.
This verse is of ten' accented syllables.
On the top most twig' that looks up at the sky,
Here there are four accents in each line, but the number of syllables varies from eight to twelve.

The variety of combinations of metres and rhymes that may be formed is endless; but a few of the more usual forms of English versification have received special names, and these we may briefly notice.

Octosyllables are verses made up each of four measures of the second kind of metre, and therefore containing eight syllables:

With fruit' (Res la' b'oor, Ca't'r bind)

Two trochaic measures are in use in English, the fifteen-syllable and the seven-syllable. Of the former the best example is Tennyson's Locksley Hall; the latter was a favourite form with Keats, as in the Ode on the Poets and Mermaid Tavern, and of Shelley, as in the Lines Written in the E乡ecan Hills.

In Elegies the lines are of the same length and
the same measure as in heroes, but the rhymes are alternate, and divide the poem into quatrains or stanzas: of four lines, as in Gray's Elegy. The Spenserian stanza, popularised by Spenser in the Faerie Queene, and much used by Byron, differs from common heroes only in the arrangement of the rhymes, and in concluding with an Alexandrine with two extra lines, giving a measure pleasing to the ear. The Chaucerian heptastich is a seven-line decasyllabic stanza called also rime royal, having three rhymes, one connecting the first and third; another, the second, fourth, and fifth; and the third, the sixth and seventh.

In triple measures, the second is commonly in eights and sixes, and the quatrains in sixes, with the third line octosyllabic, are commonly called long measure, common measure, and short measure. The second has been also called service metre, being the form of versification adopted in the metrical Psalms, in many hymns, and other lyrical pieces. From being frequently employed in old romances and ballads, this metre is also called ballad metre. A familiar example is Chaucer's Rime of Sir Thopas. The first and third lines often rhyme, as well as the second and fourth.

In triple measures the most important are the quatrains, the six-line and the eight-line stanzas. Each may be dactylic, anapestic, or amphibrachic, but the last is the most common; of the first an example is Byron's Song of Soil before his last Battle, and by Wolfe, Burial of Sir John Moore; of the third, in many ballads and songs, as in the line:

I saw 'tis the beach when the morning was shining.

The unrhymed metres are hexameters, blank verse, and choral metres, sometimes, as in Queen Med, tambic; in the Strayed Beveller, trochaic.

There are several more or less definite forms of versification. In many poems, especially the more recent ones, so much licence is assumed that it is difficult to trace any regular recurrence or other law determining the changes of metre, or the lengths of the lines; the poet seeks to suit the modulation at every point to the varying sentiments. But it may be questioned whether much of this refinement of art is not thrown away, upon ordinary readers at least, who, failing to perceive any special suitingness, are inclined to look upon those violent departures from accustomed regularity as the results of caprice.

See also the special articles in this work on Accent, Alliteration, Blank Verse, Hexameter, Lyric, Ode, Poetry, Rhyme, Song, and Sonnet; Guest's History of English Rhymes (2d ed. revised by Prof. Skeat, 1882); Prof. J. B. Mayor's Chapters on English Metre (1886); Drummond's Handbook of Poetics (Boston); and Prof. Schipper's Englische Metrik (Bonn, 1881-89).

METRE, the basis of the 'metrical' or modern French system of weights and measures, and the unit of length. The first suggestion of a change on the previous system dates as far back as the time of Philip the Fair; but up till 1790 no important change had been effected. On the 8th May 1790 proposals were made by the French government to the British, for the meeting of an equal number of members from the Academy of Sciences and the Royal Society of London, to determine the length of the simple pendulum vibrating seconds in N. lat. 45° at the level of the sea, with the view of making this the unit of a new system of measures. The British government, however, did not give this proposal a favourable reception, and it fell to the ground. The French government, impatient to effect a reform, obtained the appointment by the Academy of Sciences of a commission composed of Bois, Lagrange, Laplace, Monge, and Condorcet, to choose from the following three, the length of the pendulum, the fourth part of the equator, and the fourth part of the meridian, the one best fitted for their purpose. The commission decided in favour of the last—resolving that the weight of a quadrant of the Meridian (q.v.) be taken for the basis of the new system, and be called a 'mètre.' Delambre and Meehain were immediately charged with the measurement of the meridian between latitude 0 and Barcelona; and the result of their labours was referred to a committee of twenty members, nine of whom were French, the rest having been deputed by the governments of Holland, Savoy, Denmark, Spain, Tuscany, and the Roman, Cisalpine, Ligurian, and Helvetic Republics. The committee determined that the metre was found to be 443.296 Parisian lines, or 39.370704 English inches; and standards of it and of the kilogramme (see Gramme) were constructed, and deposited among the archives of France, where they still remain. At this time, 3 feet 11½ inches our error will be 11 per cent.

The 'metrical system' received legal sanction 2d November 1801. The following are the fractions and multiples of the metre:

<table>

</tr>
</tbody>
</table>

The term 'metrical system' is also extended to the French square measure based on the Are (q.v.), which is a square of the side of one metre; to the measure of weight based on the Gramme (q.v.), which is the weight of a cubic centimetre of distilled water; to the measure of capacity based on the litre (q.v.), the volume of a cubic decimetre; and to the cubic measurement based on the cubic metre (q.v.), which is a cubic metre. See DECIMAL SYSTEM.

Metronome, a small machine for indicating the correct time or speed at which a musical composition should be played. It is essentially an inverted pendulum moved by clockwork. The pendulum is regulated by a weight which can be pushed up and down the pendulum rod, on which is a graduated scale. The metronome as we have it was patented by Mälzel in 1816, but was really invented by Winkel of Amsterdam.

Metropolitan. See ARCHBISHOP, COLONY.

Metternich, CLEMENS WENZEL NEOFUKI LOTHAR, Prince von Metternich and Duke of Pontell, an eminent Austrian diplomatist, was born at Coblenz, 15th May 1773. His ancestors had obtained distinction in the wars of the empire against the Turks; his family had supplied more than one elector to the archbishoprics of Mainz and Trevies; and his father, Baron Georg von Karl Count von Metternich, had secured a high reputation as a diplomatist and as the associate of Kaunitz. Young Metternich therefore entered the service of his country under the most favourable auspices, of which he was not slow in taking advantage. At the age of fifteen he was educated at the university of Strasburg, where he had for his fellow-student Benjamin Constant, and from which he removed, two years afterwards, to Mainz to complete his education. In 1794, after a short visit to England, he was attached to the Austrian embassy at the Hague, in the following year marrying the grand-daughter and heiress of his friend Kaunitz. He first came into notice at the congress of Rastadt, where he represented the Westphalian nobility, after which he became ambassador to the Hague. From this point his rise was very rapid, as he added to the advantages of his birth and connections a more than
ordinary share of diplomatic ability, with the most graceful and winning manners. At twenty-eight he was appointed Austrian minister at the court of Dresden, and after the lapse of two years he was sent to the court of Berlin. Between these two he played a leading part in the well-known coalition which was dissolved by the battle of Austerlitz. After the peace of Presburg young Metternich was selected for the most important diplomatic appointment in the gift of the emperor—that of minister at the court of Vienna. Before he was made acquainted with the emperor, he was greeted with the remark, 'You are very young to represent so powerful a monarchy.' "Your majesty was not older at Austerlitz," replied Metternich, with a slight exaggeration which could not make the compliment less acceptable; and, indeed, young as he was, he exhibited an address and a knowledge before which Napoleon might blush, but of which he never could get the better. Without much ardour, with very limited sympathies, with no deep convictions, he had a clear head and a firm hand; he could keep his own secrets, and he could worm out the secrets of others; and, making himself the most agreeable man in the world, he plotted with a smiling countenance, manœuvred in a dance, and struck the hardest when he seemed to yield the most.

In 1807 he concluded the treaty of Fontainebleau, very favourable to the interests of Austria; and on the outbreak of the war between France and Austria in 1809 he was detained some time before he could obtain his passport. In the course of the campaign he was succeeded in the department of Foreign Affairs, and it was during his tenure of office that he conceived the idea of a marriage between Napoleon and an Austrian archduchess as a means of purchasing a respite for the empire. Metternich escorted Marie Louise to Paris. Amidst all the difficulties of 1812-13 Metternich maintained at first a temporising policy, but the obstinacy of Napoleon at length led him to resolve upon the declaration of war with France made in August 1813. In the autumn of that year the grand alliance was signed at Teplitz, and Metternich, in the character of the foremost minister of a great power, was brought into negotiation with the negotiations, was raised to the dignity of a prince of the empire. In the subsequent conferences and treaties the newly-created prince took a very prominent part, and he subsequently signed on behalf of Austria the treaty of Peace of Paris on 20th November 1815. He afterwards paid a visit to England, and was made an LL.D. by the university of Oxford—the only honour this man of countless orders ever received from Britain. After this he still continued to conduct the diplomacy of Austria; in 1821 he was appointed chancellor of the empire, and in 1826 succeeded Count Kielz as president of ministerial conferences on home affairs. His efforts were now earnestly directed to the maintenance of peace in Europe and the preservation of the existing state of things in Europe. This was mortally attacked by the revolution of 1848, and Metternich's hatred of revolution was fanatical. The shock, which occurred for a time half the thrones of Europe, was felt at Vienna, and the government fell, in spite of the resistance of Metternich, who maintained his policy of 'thorough' to the last. Leaving Vienna with an escort of cavalry, he fled to England, and there he remained till 1851, in the autumn of which year he made a sort of royal progress to his castle of Johannisberg on the Ithine. From this time, although the advice of the old statesman was occasionally asked by the emperor, he was never again requested to assume office. He died at Vienna on 11th June 1859. The Autobiography of Metternich (French, 1880-83), edited by his son, throws valuable light on the stirring times in which he lived. In these volumes also appears the diary of his third wife, Countess Melanie Zieyi-Ferraris, whom he married in 1831, when he was about fifty-eight years of age. She was a clty and beautiful woman, and gave her husband much effective aid. From many entries in her diary it is evident that, if her husband was stern and harsh in political strife, he was not without warm and genial affections. To her Prince Metternich was as good and great a man as ever lived, and she expresses more than once her opinion that he alone 'could save the world.'

There are works on Metternich by Binder (1836), Gross-Hoffinger (1846), Schmidt-Weissenfels (1861), Beer (1877), and see Metternich, by Colonel Malleson ("Statesmen", series, 1888).

**Mettray, a village of France, 5 miles N. of Tours by rail, noted for its great agricultural and industrial Reformatory (q.v.), the parent of all such institutions. It dates from 1839, and in 1886 had 537 inmates.**

Mettrie. See LAMETTRIE.

Metz, the strongest fortress of German Lorraine (before 1871 the principal bulwark of the north-eastern frontier of France, and capital of the department of Meurthe-et-Moselle). It stands near the Moselle at the influx of the Seille, 216 miles E. of Paris. The strength of the place consists in its exterior defences, of which the principal are a corona of forts, some greatly strengthened and improved since the German annexation, and some entirely new. The ancient city, a small historic edifice (14th to 16th century), is remarkable for its vast size and its architectural lightness, and has a beautiful spire of open work, 363 feet in height. Of other seven Catholic churches, the most interesting is St Vincent's. There are two Protestant and three Huguenot churches. The city has a library, a museum, a military academy, a music school, art and numismatic collections, &c. Apart from tanning and the making of saddles and shoes, there are few industries, though there are several iron-works in the vicinity. The trade is chiefly in wine, branded preserves, fruited leathers, &c. Pop. which in 1869 was 48,325, had in 1875, by reason of emigration into France, decreased to 37,925, or with garrison, 48,596: (1880) 59,723, including a large garrison. The Protestants are less than half as numerous as the Catholics. Metz, known to the Romans as Divodurum, was afterwards called Mettis (corrupted from Mediomatrium, the name of the people), hence the present form. Under the Franks it was the capital of Austrasia, and in 570 passed to the empire; it was afterwards made a free city of the empire, and in 1552 it was taken possession of by the French; and, although Charles V. besieged the place from October 1552 to January 1553, they kept it till it was formally ceded to them in 1648. The fortifications, already strong, were completely restored in 1674; and further repairs were added to at various dates, and after 1830 thoroughly restored. In August 1870 Bazaine was compelled to retire with his army into Metz, which after a long siege was taken by the Germans (see FRANCE, Vol. IV. p. 782); but by the treaty of Frankfort it was annexed to Germany.

See histories of the town by Cester (1871) and Westphal (3 vols. 1875-77); and the account of the warlike operations of 1870 by the German staff (1872). Compare also BAIZAINE.
Mendon, a village 5 miles W. of Paris by the railway to Versailles. The château, rebuilt by Mansard for the Dauphin in 1693, and fitted up for Marie Louise by Napoleon in 1812, was reduced to a ruin by the hands of Paris in 1871. The Forest is a favourite holiday residence, a tributary of the Lys, 24 miles SW. of Ghent. Pop. 9063.

Meulebeke, a town in the Belgian province of West Flanders, a suburb of Ghent, a tributary of the Lys, has very fertile soil, producing corn, wine, potatoes, fruit, beet-root for sugar, hops, &c., and is drained by the Moselle and its tributaries. It has valuable iron-mines, and is the first department in France for iron and steel. The finds of glass and other remains are also important manufactures of pottery, wool, glass, cottons, chemicals, tobacco, paper, beer, artificial flowers, and embroidery-work. Rock-salt mined in large quantities. In point of popular education it ranks second amongst the French departments. Dous being first.

Meuse (Dutch Maas), an affluent of the Rhine, rises in the French department of Hauto-Marne, flows in a northerly direction in a deep, narrow, winding valley, past Verdun and Sédan, entering the country just below Givet, on to Namur, whence it is divided by a branch to the north, then flows north past Liége and Maastricht, and, bending abruptly to the west, finally joins the Waal, one of the mouths of the Rhine, from the left opposite Gorkum. The united streams take the name of the Maas, which soon divides again. The southern branch passes through the city of Maastricht and Hollandsche Diep, and, again dividing, reaches the sea in two channels, the Old and the New Maas, near the Hanshaven at Rotterdam. The entire river is 500 miles in length; it is navigable from Verdun. Area of basin, 18,530 sq. m. Its principal affluents are the Sambre on the left and the Ourthe on the right.

Meursius, Johannes, the elder (properly Jan de Meurs), a learned scholar, was born at Looz-dainen near the Hague, 9th February 1579, studied philosophy at Leyden, next travelled afterwards through Europe with the son of the Grand-pensionary Barneveld, and became in 1610 professor of History, and next year of Greek, at Leyden, and afterwards Historiographer to the States-General. In 1629 he became professor of History in the academy at Sorè in Denmark, and there he died, 20th September 1639. His productions are many, and his works are a storehouse of materials for study, especially on Greek antiquities. He edited Cato's De Ré Rustica, Plato's Timæus, the Character of Theophrastus, and a long series of the writings of the later Greek writers, as Lycurphon, Constantinus Porphyrogénitus, Philostaurus, Aristoxenus, Constantinus Manasses, Theophylact, Theodorus Metrocles, Antigonus Carpystüs, Apollonius Dyskulos, and Philemon. Other works are the useful Glossarium Graeco-Latiniin (1614), Des Belgici (1612), Athene Beati (1629), Historia Dania (1630), and a long series of monographs on questions of Greek antiquities which may be found in the Theaurus Antiquitatum Graecarum of Gronovius. A collected edition of his works was prepared by Lami (12 vols. Flor. 1741-63).--His son, Johannes Meursius, the younger, was born at Leyden in 1613, and died in Denmark in 1654. He wrote a number of monographs, sometimes on works of value, but his name by a singular misfortune survives in connection with the filthy Elegiæ linguae Latinae (best ed. Leyden, 1657), with which it is certain that he had nothing to do. The origin of this work being either very remote, or very late, but was most probably printed about 1680 at Lyon or Grenoble. It contains a little poem by Chorier (1609-92), hence his name has been since easily connected with the book, the origin of which still remains an unsolved puzzle.

Merton-et-Moselle, a department in the north-east of France, formed, after the treaty of 1871 with Germany, out of what remained of the former departments of Moselle and Meurthe. It has four arrondissements—Briey, Lunéville, Nancy, and Tonléau-en-royaume. A clergyman, and a pop. (1872) of 657,137; (1861) 444,150. The capital is Nancy. The department belongs to the plateau of Lorraine, has very fertile soil, producing corn, wine, potatoes, fruit, beet-root for sugar, hops, &c., and is drained by the Moselle and its tributaries. It has valuable iron-mines, and is the first department in France for iron and steel, and the third in France for glass. There are also important manufactures of pottery, wool, glass, cottons, chemicals, tobacco, paper, beer, artificial flowers, and embroidery-work. Rock-salt mined in large quantities. In point of popular education it ranks second amongst the French departments, Dous being first.

Meuse, a department in the north-east of France, touching Belgium in the north. Area, 2404 sq. m. Pop. (1872) 234,725; (1861) 292,293. The surface is traversed from south-east to north-west by the wooded Argonne ranges, which form the right and left bank of the river Meuse, and separate it from the basin of the Seine on the west and from that of the Moselle on the east. The soil in the valleys is fertile and well cultivated. Wheat, oats, beet-root (for sugar), hemp, oil-plants, and wine (nearly 9,000,000 gallons annually) are the principal products. Iron is mined and manufactured, glass and paper are the chief branches of industry. The four arrondissements are Bar-le-Duc, Commercy, Montmédy, and Verdun. The capital is Bar-le-Duc.

Mexico, the most southerly country of North America, is a federal republic, embracing twenty-seven states, a federal district, and two territories. It extends from the United States and Guatamala, with an extreme length of nearly 2000 miles; its breadth varies between 1000 and (in the latitudes of Tehuantepec) 130 miles. It has a coast-line of almost 6000 miles, but with scarcely a safe harbour beyond the noble haven of Acapulco; on the south the province is more extensive. There are only open roadsteads, or river-mouths closed to ocean vessels by bars and shallows; harbour-works, however, were in active construction at Vera Cruz and Tampico in 1890. From the south-eastern and north-western extremities of the republic there extend the peninsulas of Yucatan and Lower California, enclosing the Gulfs of Campeche and California respectively. The islands of Mexico are few and of no importance.
In area Mexico almost equals Great Britain and Ireland, France, Germany, and Austria-Hungary together. The figures given in the following table are official, but in most cases the observations have only as approximate; large sections of Michoacan and Guererro, and also of Sonora, have not yet been explored; and there are still many Indians that have never even come in contact with the white man. Of the entire population the western coast is 30 per cent., the interior highlands, the Indians 38, and the half-castes (mestizos) 42 per cent. The estimated population in 1898 was 12,250,000.

</table>

There are separate articles in this work on most of the states and chief towns. Surface.—For the most part Mexico consists of an immense tableland, which commences in the United States as far north as Colorado, and gradually rises to over 8,100 feet at Mazatlan (the highest town by the railway), 76 miles N. by W. of Mexico city, and the elevation nearly of the whole country is maintained in all the southern central plateau; at El Paso, on the northern frontier, the elevation is only 3,571 feet. The prevailing formations are metamorphic, but partly overlaid by igneous rocks of geologic epoch, rich in metallic ores. In the highest ranges granites and other igneous rocks prevail, with deposits of sulphur and pumice, and other recent volcanic discharges. In the north chalk and sandstones become prevalent. The escarpments of this plateau form most of the southern part of the country, and the continuous chain extending from Patagonia to Alaska has now been abandoned. The most important range is the Sierra Madre (over 10,000 feet, and extending from Tehuantepec into the United States); parallel with this run the Sierra of the east coast and west coast. The interior of the country is also much broken up by short cross-ridges and detached peaks, the principal being the Cordillera de Anahuac (q.v.), culminating in Nevado de Toluca (19,454 feet), the highest point on the North American continent, and the Popocatepetl (17,529). The Pico de Orizaba (20,360) is 18,205 feet high. Most of the Mexican volcanoes are extinct or quiescent, and violent earthquakes are of rare occurrence. No disturbance so remarkable has occurred since the upheaval of Jorullo (q.v.) in 1550. On the Atlantic side the plateau descends abruptly to the narrow strip (about 60 miles) of gently sloping land that forms the Pacific shore, where the coast-lands vary in width from 40 to 70 miles, the descent is more gradual. Of the present lakes the only one of great size is Chapala (q.v.), which is traversed by the Rio Grande de Santiago; but considerable bodies of water collect in depressions in the uplands during the heavy rains, and even flood the surrounding country for a time. The rivers of Mexico are of little use for navigation. South of the Rio Grande del Norte, on the Texan frontier, they are mostly impetuous mountain-torrents, or flow through rocky gorges (bar- rancas), sometimes 1000 feet deep. Only in the narrow strips between the plateau and the coast are they available as channels of trade and communication; and in this respect perhaps Arabia alone is less favoured than Mexico. Climate and Agriculture.—In the plateau region, or tierras templadas, the climate is almost that of perpetual spring, and the atmosphere remarkably free from moisture. It is to this peculiar dryness that the city of Mexico, the soil of which has been soaked with the filth of centuries and never properly drained, owes its immunity from pesti- lence; but on the other hand throughout the plateau agriculture is dependent on the use and control of water for irrigation purposes, and an immense desert tract extends between Chihuahua and Zacatecas. Wood in all this upland region is scarce and dear, though there are valuable forests in the elevated north on the plateaus of Sonora. The lands water and wood are abundant, and the soil fertile, but the climate is such that white men cannot work as labourers there. Yet Mexico contains as fine agricultural land as any in the world, and in most parts two crops a year are grown; while already a score of agricultural colonies, drawn from various nationalities, have been established in the country. Northern Mexico is the original home of the ‘cattle-range’ business, and there vast herds of horses, cattle, and sheep form the principal wealth of the people. The coast belt and the terraces up to 5000 feet constitute the healthiest section, where the temperature ranges from 60° to 110° F., and, in the south at least, the magnificent tropical vegetation and the yellow fever and vonzie reign with equal vigour. Two or three hours by the Vera Cruz Railway carries the traveller from Esperanza, on the west coast, to the very heart of the tropics. The cold lands, or tierras frias, embrace all the country above about 5600 feet, including the few highest peaks covered with perpetual snow. South of about 28° N. there are only the wet and the dry season, the former from June to October. Further north there are four seasons; but in the highest zone the rainfall is very scanty, and northern Mexico and the Californian peninsula especially are exposed to seasons of drought. The vegetation of Mexico has the same wide range as the climate. The eastern rice and woods and valuable timbers abound in the virgin forests, as well as medicinal plants, India-rubber, palms, &c., and oranges and bananas, many varieties of cactus, olives, sugar, coffee, cocoa, rice, indigo, cotton, and tobacco, besides the omnipresent cacti. The climber’s delight is the tropical and the palm garden, including the palms, oranges, cacti, olives, tobacco, and of course the maize, go as readily over a great part of the temperate zone, where the characteristic vegetation embraces pines, evergreen oaks, the magpie or Ayuwe Americana (q.v.), and the hemlock (Apuwe americana), a large tree that is so called. The last two are nearly as frequent also in the tierras frias. The vine flourishes in some districts, especially near El Paso, Durango, and Parras in Coahuila,
where a good wine is made; and mulberry plants have been imported from Europe to develop the silk industry. In Lower California a good deal of Archil (q.v.) is collected, and chicle gum is extracted and prepared in the forests along the coast. Cocoons also in Mexico are widely developed. Primitive methods are followed by the people generally, and the American plough has only in a few localities displaced the crooked stick, sometimes shod with iron, and hauled by raw-hide thongs to the oxen's horns. There is, however, some tendency to improve methods, which date from the hacendados, or great landed estates. To their absence owners such estates, in spite of the expense of irrigation and the shiftless methods in use, are said to return large incomes; but the difficulty and cost of transport are so great that in many parts of Mexico no more corn is grown than suffices to meet the wants of the immediate neighborhood. Of maize, 128,292,000 bushels are raised in an average year. The other principal crops are wheat, 11,144,000 bushels; beans, 7,647,000 bushels; barley, 3,757,000 bushels. The value of the cotton crop averages £1,645,900. Of sugar-cane £3,233,000, of hemp and coffee a third as much, and of tobacco a fourth. In 1889 henequen was exported from Yucatan to the value of over a million sterling. Mexico is rich in minerals, many of which have been worked from a very early date. Silver-mining, especially, has been an important industry ever since the conquest, and a considerable number of the mines are still worked at a profit. Gold, though to a greatly less value, is also produced to a considerable extent, which dates from 1537, and may be taken as substantially accurate, show the production of the precious metals, from that year to 1884, to have been: gold, 114,384,204 dols.; silver, 3,105,979,922 dols.—total, 3,229,363,226 dols. Copper is largely mined in some sections, being found in a pure state in Chihuahua and Sonora; jalisco, and elsewhere associated with gold. Other important minerals are iron, including enormous masses of meteoric iron ore, and the mountain a mile from Durango, the Cerro de Mercado, a solid mass of magnetic iron ore; lead, found associated with silver; gold; sulphur, zinc; alum, pecten; cinna- mar, asphalt, and petroleum; bauxite salt, marble, alabaster, gypsum, and rock-salt in great quantities. There are also said to be large deposits of coal, some of excellent quality, in various localities; but as while there is a large mining at Huatabampo Throughout Mexico over 100,000 workmen are employed in the various mining enterprises—above 350 in number, and largely supported by American and British capital. Formerly the Mexican ores, especially argentiferous lead, were sent for smelting to the United States; but as the American tariff became prohibitive, establishments were set up on Mexican soil, to which in 1890 some American foundries and works also were transferred.

Manufactures and Trade.—In all Mexico the number of factories using steam power does not greatly exceed one hundred. Very little labour-saving machinery of any kind has been introduced, owing partly to the scarcity of fuel and water, and partly to the difficulty of repairing expensive and complicated machinery, usually—on the haciendas and farms in the back country, which are obstinately opposed to any change. In 1888 there were 98 cotton and 16 woolen factories in Mexico, besides 7 paper-mills and 2 pottery employing steam. Flour and unrefined sugar are also prepared, and a large sugar refinery was erected at Lazaro Cardenas in 1890 while there is a large refining for the local manufacture of peulia, and the extraction of henequen fibre, too, is an important industry. Bounties are offered by some states for the establishment of factories within their bounds. But the handier production of such articles as pottery, saddles, sandals, many coarser textiles, the national hat, the sombrero, and the national dress, pulque, mescal, and tequila, which are largely in the hands of the agave family, is much more considerable. The greatestbulk of the Mexican exports is always formed by the precious metals—coin, bullion, and ores; yet the amount of agricultural products and other merchandise has greatly increased since the con- struction of the railways. Of the former, silver was not when there were none; in 1880 there were 655 miles, in 1890 over 5,500 miles open for traffic. The rapid construction of these lines, most of which are in English hands, has saddled the country with heavy responsibilities; the subventions payable to the several companies in the year 1890 amounted to £697,000—about one-seventh of the government's total income—and the sum increases yearly, in accordance with agreements entered into with the companies. Moreover, the spread of the railways has made an excuse for the almost universal neglect of road-making, which is still, on the whole, bad enough before. The fine highways constructed by the Spaniards were allowed to fall into destruction during the long civil wars, and their present deplorable condition makes them either a lure for the robbers or an impeding vexation of the country. A still more serious obstacle to internal commerce is the crushing system of inter-state customs—the aclamaciones—a heritage from the days of Spanish rule; they were abolished by a decree of 1886, but in 1890 the British minister reported that they still existed under various names in the territories and federal district, and in most of the states. Under the excise system, moreover, nearly every possible product, every branch of industry, every social function, even, is taxed; and a swarm of petty officials in every city, town, and hamlet see that nothing escapes its tax, from a bag of seaweed or shavings to a funeral or a bandana. In 1890 the fiscal gendarmeria alone cost four-fifths as much as the foreign office and the judicial power together. Still, in spite of these impediments the trade of Mexico within recent years has steadily increased. During the period 1890-95 the exports advanced from 63,276,400 to 90,834,950 dols., and the imports varied from 30,000,000 to 43,000,000 dols. (=266l.). Of the exports in 1895 the precious metals represented 33,000,000 dols., hemp, coffee, hides, wool, tobacco, and vanilla came next. Nearly two-thirds of the total trade is with the United States, and one-fourth with Great Britain; France follows at some distance, and Germany yet further behind. Home manufactures and the distribution of merchandise are largely in the hands of foreigners. Of late years a large number of French merchants have settled in Mexico, and have nearly everywhere superseded the Germans, who controlled most of the trade from 1850 to 1870. In 1888 there were 12,390 French in the republic, and only 800 Germans, and the former had practically monopolised the dry-goods business of the country, and were pressing their rivals closely in other departments, such as hardware, in which the Germans had secured the lead. Great Britain impr- ised exports from Mexico, followed by Germany, with silver ore, and exports thither cottons, woollens, and linen, iron, machinery, and coal; in 1885-89 the value of the former decreased steadily from £23,24,817 to £465,904, while that of the latter increased from £285,357 to £1,82,906.
and can be re-elected for a second term; the senators (two for each state) and representatives (one for every 40,000 inhabitants) receive a salary of $2,800 a year, and the judges of the Supreme Court are in the same position as that of the United States; and the several states have elective governors and legislatures. It must be added, however, that neither government nor opposition is conducted on any principle: the government is a personal, and often a family, affair. There is no party in the real sense—though it rises and falls with its leader, and in the past has found its favourite and safest expression in revolution, which either lifts the pretender into power or leaves him before a firing-party. Either event dissolves the opposition, for no principle has been involved. A strong government, in these circumstances, is most necessary in Mexico, and the cost of the army (27,000 men) swallows up one-third of the annual receipts. As for the navy, it consists of some revenue cutters, a steam-tug, and a training ship (built 1890), and costs £75,000 a year. The receipts of the Mexican government fell in 1890-95 from 67,306,753 dollars to 43,945,700 dollars: about five-eighths of this is derived from customes. Within the same period the expenditure was reduced in an almost corresponding degree. Both in the republic and abroad, however, the Mexican government has strained every nerve to meet its obligations, and the general confidence has increased of late years; while the individual states, as a whole, succeed in keeping their expenditure within their income. The interest on the national debt has been punctually paid since 1886, in which year an arrangement was come to between the Mexican government and the English bondholders, under which the various debts were converted and redeemed (in 1889) at 40 per cent. The entire foreign debt of Mexico was in 1860 about 43,000,000 dollars, and 5,500,000 dollars of the banking facilities were greatly extended, charters being granted for banks of issue and others in various towns; whereas previously banking had been confined almost entirely to two large banks at the capital, and their branches. In 1890 there were 28,437 miles of telegraph and 4349 of telephones in operation in the republic.

Social Aspects.—Nearly half of the population of Mexico are mestizos, who are the farmers and rancheros, the mistleets and servants. Many of them are intelligent and skilful, but the lower classes are the most hopelessly idle and vicious. The Indians, who constitute over one-third of the population, lead a life of their own, mingling but not mixing with the other races. From them chiefly are drawn the peasants, or agricultural labourers, who, through a system that keeps them permanently in debt, to-day are scarcely less slaves than were their ancestors under the Spaniards. On every hacienda there is a tienda, or store; there everything must be purchased by the employes, whose wages (9d. to 12d. a day) is sometimes deducted from it. The Indian is a poor workman and unreliable, though as a rule tractable if well treated, and easy to manage; his wants are few, and his small surplus earnings usually find their way in a few hours into the pockets of the priest, the pulque seller, or the officers of the hacienda. A pit, or monte table. He has no idea of honesty, however; he does not steal on a large scale, but tools, filth, and crops must be constantly watched. The Indians who are not employed on the estates usually live in communities resembling those of the United States. Some have been taken by the rude Chichimecs, a fresh migration brought, among other kindred nations, the Aztecs into the land. Within two centuries and a half this last people had become predominant. But these Aztecs, in a great measure, fell to savagery. They were a ferocious race, with a religion gloomy and eremite, and they grafted upon the institutions of their predecessors many fierce and sanguinary practices. Thus they produced an anomalous form of civilization, in which the Spaniards, who were mild and unbroken in manners, were mingled with the Spaniards, who were of a childless and ferocity. After wandering from place to place, the Aztecs founded about 1225 the city of Tenochtitlan, or Mexico; a hundred years later they had extended their sway beyond their plateau-valley, and the樛 strength of the empire was found to stretch from ocean to ocean.

Their government was an elective empire, the deceased prince being usually succeeded by a brother or nephew, who must be a tried warrior;
but sometimes the successor was chosen from among the powerful nobles. The monarch wielded despotic power, save in the case of his great feudal vassals; these exercised a very similar authority over the peasant class, below whom, again, were the slaves. Taxa were supported by the wealth of Mexico, which was immense even then. The laws were severe, nearly every crime being met with capital punishment in some form; but justice was administered in open courts, the proceedings of which were perpetuated by means of picture-written records. The Mexicans apparently believed in a supreme deity over the existence of all things, the ruler of the universe; but the popular faith was polytheistic, with a number of chief and many more inferior divinities, each of whom had his sacred day and festival; whilst a crowd of nature-spirits peopled the hills and woods. At the head of the Aztec pantheon was the frightful Huiztilopochtli, the Mexican Mars. His temples were the most splendid and imposing; in every city of the empire his altars were drenched with the blood of human sacrifice, to supply victims for which the emperors made war on their neighbours or the remote territories, or for a certain number of men, women, and children by way of indemnity. The victims were borne in triumphal processions, and to the sound of music, to the summit of the great pyramidal temples, where the priests shed the life-blood, which they believed to be from the sacrificial stone, and, slashing open the breast, tore from it the bleeding heart and held it up before the image of the god, while the captor carried the carcass on to feast on it with his friends. In the years immediately preceding the Spanish conquest, the numbers of the victims annually immolated, including infants, for the propitiation of the rain-gods. These atrocities, originally referable to the entire absence of live-stock, were incongruously blended with milder forms of worship, in which fruits, flowers, and perfumes were offered up among onans and outbursts of song and dance. According to the tradition, Quetzalcóatl, who delighted in these purer sacrifices, had once reigned among the Toltecs in the golden age of the world, but, being obliged to retire from earth, he departed by way of the Mexican Gulf, promising to return. This tradition, the spirit of devotion which sustained the Spaniards, whose light skins and long dark hair and beards were regarded as evidences of their affinity with the long-looked-for divinity. The Mexican priesthood formed a rich and powerful order, of high social rank, and some of the principal Cortes found as many as 5000 attached to the great temple of Mexico. The education of the young of both sexes was entrusted to the priests and priestesses; and the sacrificial class were thus able to exercise a widely-diffused influence, which, under the later rulers, was almost equal to that of the emperor himself. The women shared in all the occupations of the men, and were taught, like them, the arts of reading, writing, ciphering, singing in choras, dancing, &c., and even initiated in the secrets of astronomy and astrology.

Cortés landed in Vera Cruz 1519; the history of the conquest of the Aztec land is told at length in the article on that greatest of the conquistadores, who gave to Spain what for centuries remained her richest province. Before his energy, and the superhuman force of his followers, the last empire of the native empire crumbled away. In 1540 Mexico was united with other American territories—at one time all the country from Panama to Vancouver's Island—under the name of New Spain, and governed by viceroys (57 in all) appointed by the emperor. It is probable that the Catholic clergy led to the suppression of almost every trace of the ancient Aztec nationality and civilisation, while the commercial system enforced crippled the resources of the colony; for all foreign trade with any country other than Spain was prohibited on pain of death. The natives were distributed as slaves on the various plantations, though they were also christianised and looked after by the Inquisitorial tribunals, whose operations, however, were relatively mild. In 1867, Mexico was again abandoned as simply a mine to be worked by the labour of its people for the benefit of Spain. Yet, notwithstanding these drawbacks, it ranked first among all the Spanish colonies in regard to population, wealth, and resources. For nearly three centuries it may be said to have lain in sullen submission beneath its cruel conquerors' heel, till in 1810 the discontent, which had been gaining ground against the viceregal power during the war of the mother-country with Napoleon, broke into open rebellion under the leadership of a country priest, named Hidalgo. After his defeat and execution in 1811 Morelos, another priest, continued the struggle till he shared the same fate in 1815; and a guerilla warfare was kept up until, in 1821, the capital was surrendered by O'Donjón (a Mexican general), and Spain lost all its American possessions.

In the following year General Iturbide, who in 1821 had issued the plan de Iguala, providing for the independence of Mexico under a prince of the reigning house, had himself proclaimed emperor; but he was overthrown by General Santa-Anna, and in 1823 he was banished to Italy with a pension. Returning the following year he was taken and shot, and the federal republic of Mexico was finally established.

For more than half a century after this (till 1876) the history of Mexico is a record of nearly chronic disorder and civil war. Within that period the country had fifty-two presidents or dictators, another emperor, and a regency; and in nearly every case the change of administration was brought about with violence, a respectable proportion of these great men being ultimately shot by some opposing faction. In 1836 Texas secured its independence, for which it had struggled for several years, and which Mexico was compelled to recognize in 1848. In that year Texas was incorporated with the United States, but its western boundary was not settled, and the Americans coveted a particular strip of territory, and sent troops to seize it. The war thus wantonly provoked was continued with great energy by both parties until 1848, when peace was concluded at Guadalupe-Hidalgo. The total amount of the indemnity there provided, including all claims in which the government of the United States was involved, was more than 18,000,000 dollars. The war led to the withdrawal of the last of the Spanish and American troops from the Southwest. The United States now ruled the former province of Texas, and from the Gulf of Mexico to the Rocky Mountains; the armed forces of France and Spain were all driven from the Gulf of California; the Pacific coast was open to their flag, and the Mexican government was reduced to the small islands of the Gulf and the coast of California.
followed by the arrival before that city of the allied fleet. Preparations to advance at once upon the capital alarmed the provisional government, and brought about an armistice, with a view of negotiating a treaty for the future regulation of commercial intercourse between Mexico and the great European powers. This treaty was drawn up and provisionally ratified by the different commanders, but not confirmed on the part of France, and consequently the French troops retained occupation of the Mexican territory after the English and Spaniards had declined to join in further hostile demonstrations. In April 1862 the French emperor formally declared war against the government of Juarez; but the French never met with the welcome they expected from the people, and had ultimately to withdraw, without permanent success, in 1867—mainly because of the jealousy of their action shown by the United States, Maximilian, Archduke of Austria, who had become emperor of Mexico under French auspices, was executed in the same year, and Juarez returned to practically absolute power. For this period, see

Cathedral, City of Mexico.

Juarez and Maximilian. On the death of Juarez in 1872, the chief-justice, Lerdo de Tejada, assumed the presidency, in which, after a revolution, he was succeeded in 1876 by Porfirio Diaz, one of the ablest of Mexican rulers. He was re-elected in 1884, in 1888, and in 1896; and under him the position of the republic, with regard both to security and to development of its resources, has steadily improved.

See David A. Wells's Study of Mexico (New York, 1887); also Madame Calderon de la Barca, Life in Mexico (1843); Brocklehurst, Mexico To-day (1882); Castro, Mexico in 1882 (New York, 1882); E. A. Ober, Travels in Mexico (Boston, 1884) and Mexican Resources (1874); Von Humboldt, Natural History of the Cordilleras (Vienna, 1806); Mrs F. C. Gooch, Face to Face with the Mexicans (1890); and Sir Francis Deny's Report on the Finances and Land System of Mexico (1890). An excellent history is H. H. Bancroft's Popular History of the Mexican People (1888); see also, besides the articles Cortés and Las Casas, Ortega's Apólogica Afanes de la Compañía de Jesús en la América Septentrional (Barcelona, 1754; new ed., Historia de Nayarit, &c., Mexico, 1887); Moris, Mexico y su Revolutions (8 vols., Paris, 1834), and Documentos para la Historia de Mexico (30 vols., Mexico, 1853-57); Lerdo de Tejada, Comercio exterior de Mexico desde la Conquista hasta hoy (Mexico, 1831); Frost, History of Mexico (New Orleans, 1882); Ballon's Aztec Land (Boston, 1890); and Miss Susan Halle's volume in the 'Story of the Nations' series (1901). Mexico (City), the capital of the republic, is situated 3747 feet above the sea, at the lowest level of the Aztec lands. It occupies a north-eastern section of the Analuac plateau. Lake Tezcuco, the largest of the six lakes that occupy this hill-girt valley, and amid whose waters, Venice-like, the city first rose, has now retired 25 miles to the north-west—partly filled up by drainage deposits. In the Aztec city the principal thoroughfares radiated from an immense central square, in which towered the great temple of Huitzilopechti; and this arrangement is yet preserved in the modern capital. All the main streets converge on the Plaza Mayor, which is the site of the old Teocalli occupied by the no less famous cathedral (1573-1637). The walls of this imposing building, forming a cross 426 by 263 feet, alone cost nearly £400,000, and the interior, with its twenty chapels and elaborate ornamentation, much more. Built into the foot of one of the two open towers (218 feet) is the famous 'Aztec' (Toltec) calendar stone. Facing in the courtyard are the principal palace, and on the sides of the plaza are the National Palace (the old vice-regal residence), the national Monte de Piedad, the post-office, and the national museum. Other noteworthy buildings are the national picture-gallery and library, the school of mines, the mint, the Turibide hotel, and the former palace of the Inquisition, now a medical college; and, mostly in secularised ecclesiastical buildings, there are academies of law and engineering, a conservatory of music, and an academy of fine arts. There are still left fourteen parish and a number of other churches, including the cathedral of the American Episcopal mission. The principal streets are broad, clean, and well paved and lighted, with houses of stone gaily painted in bright colours. Among the monuments of the city are the noble Columbia monument (1877), the statue of Cuitlahuettotzin, the last of the Aztec emperors, and that of the engineer Martinez (1883). In addition to the abovementioned, with its statues of bees, Mexico is remarkable for the extent and beauty of its paseos, or raised paved roads, planted with double rows of trees, which diverge far into the country from every quarter; and there are still on Lakes Chalco and Xochimilco, where a line of low floating gardens for which the ancient city was so celebrated. Attempts have long been made to drain the valley of Mexico. A tunnel through the lowest hills to the Tula River (5 miles), cut in 1667-8 by Martinez, proved insufficient, and the city was flooded from 1652 to 1654; and even an open cut through the mountains (1637-67), now 10 miles long and with a greatest breadth of 361 and a greatest depth of 197 feet, has never entirely fulfilled its purpose. Consequently, in the city, with a temperature that never ranges beyond 70° and 50° F., from one
eighth to one fifth of the deaths are due to con-
sumption and pneumonitis, and one-third to typhoid
and other fevers. It is only the extreme dryness of
the atmosphere that renders the site habitable as
well as the very large drying. It is not now intended
to drain the valley, were begun in 1890 by two
English companies, and were practically com-
pleted in 1895, at a cost of £2,000,000. The
trade of Mexico is chiefly a transit trade, and its
manufactures (cigars, religious art objects, potter-
y, silver-work) are unimportant. Foreign
enterprise is already working great changes
and there are now railways to Vera Cruz (263
miles), to El Paso (1224), Laredo (540), and Ciudad
Porfirio Diaz (1089) — the last three on the Texan
frontier — as well as other points. Pop. 550,000.

**Mexico.** Gulf of, a basin of the Atlantic
Ocean, is closed in by the United States on the
north, by Mexico on the west and south, and its
outlet on the east is narrowed by the jutting
peninsulas of Yucatan and Florida, which approach
within 500 miles of each other. Right in the middle
of this entrance is planted the island of Cuba,
dividing the entrance. Two other large islands, and
that of Yucatan, the former connecting the
mouth of the Gulf of Mexico, with the Caribbean Sea. Dr John Murray calculates the
area of the gulf at 716,200 sq. m. Over a fourth of
this area the ocean-floor lies at a depth of between
1000 and 3000 fathoms, while 78,000 sq. m. is deeper
still. The shores, however, are very shallow —
as it were, the broad rim of this central cauldron;
the portion less than 100 fathoms deep exceeds
400,000 sq. m. The extreme length from SW. to
NE. is more than 1100 miles. Of the numerous
bays, the largest is the Bay of Campeche (Chub-
chee). The coasts are mostly low and sandy or
marshy, and are lined with numerous lagoons;
the best of the few good harbours are those of New
Orleans, Pensacola, and Havana. The gulf is
visited from September to March by violent north-
local rivers it receives are the
Mississippi and the Rio Grande del Norte. See
Gulf Stream.

**Meyer.** Conrad Ferdinand, Swiss poet and
novelist, was born on 12th October 1825, at Zurich,
and was educated in Berlin. He settled in 1877. His style
graceful, and he excels in charming poetry and in
genre-pictures of descriptive work. His chief novels are Jörg Jenatsch (1857; 7th ed. 1889), a story of
Switzerland in the 17th century, and Der Heilige
(1899; 9th ed. 1899), two of the best historical
novels of modern German literature. His power is
also well shown in Das Amulet (3d ed. 1882), Der
Schuss von der Kanzlei (3d ed. 1882), Die Leiden
ernen Knaben (3d ed. 1889), Die Hochzeit des Mönchs
(4th ed. 1889), Die Rächerin (1885), and Die Ver-
suchung des Pescarta (1887). His poetical skill is
best displayed in the idyllic epic poem Ritter und
letzte Troje (1872; 7th ed. 1888), in Gelichte (1882;
3d ed. 1887), and in Engelsberg (2d ed. 1886).
There is a Memoir of him by Teitler (1885).

**Meyer.** Heinrich August Wilhelm, com-
mentator, was born at Gotha, 10th January 1800,
studied at Jena, was pastor at Harste, Huy, and
Neustadt, retired in 1848, and settled in Hanover,
where he died 21st June 1873. His name survives in
his Commentaries on the New Testament —
a monument of exegetical science (commenced 1832).
Later editions showed constant improvements, and
since his death this work has been continued by Weis,
Wendt, Bysching, and others. The English
translation in Clark's series is in 20 vols. (1873-82).

**Meyer.** Joseph, publisher and industrial or-
ganiser, was born at Gotha, 9th May 1796, and
died on 27th June 1860. A man of great energy
and liberal ideas, he started several industrial
enterprises, the most important being the issue of
great serial works by subscription at low prices,
such as the German classics, the Konversations-
lexikon (see ENCYCLOPEDIA), People's Library of
Natural Philosophy, History, Languages, Publishing
business, the 'Bibliographical Institute,' was founded at Gotha, but in 1828 was transferred to Hildburghausen, in 1874 (by his son) to Leipzig.

**Meyerbeer.** Giacomo, operatic composer, was
born at Berlin, September 3, 1791. The son of
Hera, a wealthy Jewish banker, his name was originally Jacob Beer; he was afterwards adopted from a benefactor, and the whole consolidated and Italianised. His musical genius was first shown on the pianoforte;
at the age of seven he played in public Mozart's D minor concerto. He was received, when fifteen,
into the house of the celebrated musician, the
Abbe Vogler, at Darmstadt; with his fellow-pupil
Weber he was on terms of the most intimate and
lasting friendship. His earlier works, produced at
Munich and Vienna, were unsuccessful, but in the
latter city he was more fortunate. In 1835 he
might have stood against that of any rival had he
chosen to rely on this talent. His ambition, how-
ever, was to succeed as a composer; and on the
advice of Salieri he proceeded to study vocal com-
position in Italy. There Rossini's music had just
reached the public by storms; and Meyerbeer,
his remarkable adaptability, after three years was
able to produce operas in the new style, which at
once gained a cordial reception; the last of these,
Il Crociato, brought out at Venice in 1824, was
received with universal acclaim, and the composer was
presented on the stage with a laurel crown. From
1824 to 1831 he lived mostly in Berlin, married,
and had two children, whose loss in infancy he keenly
felt. He also applied himself, with the unremitting
industry he evinced from boyhood, to a minute and
comprehensive study of French opera. The result
of this was seen in the production at Paris in 1831
of Robert le Diable (libretto by Scribe), in which
a totally new style was evident. It had un-
paralleled success over all Europe, and made the
fortune of the Paris opera — even Rossini was
drawn rather too the shadow. It was followed by
1836 by the Huguenots, which, with the assistance
of a magnificent cast, almost eclipsed its prede-
cessor. He was soon after appointed by the king of
Prussia as his Kapellmeister at Berlin. Here he
wrote the French opera, Le Prophète, the success of which was signalled by the first appear-
ance of Jenny Lind. After long preparation, Le
Prophète appeared at Paris in 1849, also with
success, though it was not altogether to the mind
of even friendly critics. The composer now ven-
tured into a fresh field, the Opéra Comique; L'Etoile du Nord, given in 1854, carried the day
in spite of the prophecies of French critics, and
was succeeded in 1859 by Le Pardon de Plo-
viron, known in England as Dinorah. He was
subsequently associated with L'Enfant de la
Jeunesse de Goethe, the setting of which M. E. de
Bury, the author of the work, says he saw com-
plete, but which has not hitherto come to light.
In 1861 he set to work with his usual anxiety
and fastidiousness on the production of L'Africaine,
which had been hanging by a thread, and whose
delicate health gave way before his ceaseless
labours, and he died at Paris, May 2, 1864. The
opera had a triumphant reception a year later.
Scarce any composer has been so variously
estimated as Meyerbeer. The magnificent praise
of Félic and the enthusiastic praise of Bury cannot
but the emphatic condemnation of Schumann and
the savage and ungrateful attacks of Wagner. There
seems to be truth in the main charge of the latter,
that Meyerbeer, inspired by no deeply rooted artistic principle, made everything subservient to theatrical effect. His successive adoption of widely-different styles bears this out; and heine, an enthusiastic admirer, mentioning his admitted mastery of instrumentation, still extends it to his never-resting efforts to make everything and everybody concerned in his operas instrumental towards his success. But even opponents concede the power and beauty of such a piece as the famous duet in the fourth act of the Huguenots. Endowed with a considerable native talent, he had by unremitting labour mastered the effects of all the different schools, and was able to utilise his knowledge to brilliant purpose. Written ad captandum, his grand operas, unique rather than original, have accurately hit the taste of the public, and to this day these splendid melodramatic spectacular works are the pièces de résistance of the Paris Opéra. See Bennett's biography in Novello's series; or Fétes, Biographie Universelle des Musiciens.

Mezières, the capital of the French department of the Meuse, on a bend of the Meuse, opposite Charleville (q.v.), 155 miles by rail NE. of Paris. Strongly fortified by Vauban, and protected by a citadel, in 1821 it was successfully defended by the Chevalier Bayard, with 2000 men, against 40,000 Spanish and French troops under Cardone; two months against the Allies, who besieged it after the battle of Waterloo; and in the Franco-German war of 1870-71 capitulated after a frightful bombardment. The principal building is the Flambouyan church, restored in 1884, in which Cardinal Richelieu is buried in 1356.

Mező-Tur, a town of Hungary, 40 miles by rail NE. of Budapest. Pop. (1890) 2,735.

Mezquita, the name of two trees or shrubs, of the natural order Leguminose, sub-order Mimose, bearing pods filled with a nutritious pulp, and found in Mexico, Texas, Arizona, &c. The Commum Mezquita (Prosopis glandulosa, formerly Algaroide) is usually a large shrub (though sometimes 40 feet high), with stems often decumbent, and armed with strong straight spines. In dry seasons it exudes a great quantity of gum (Gums Mezquide), similar in quality to gum-arabic. The Curly Mezquita, Screw Bean or Tornillo (Prosopis juliflora) is sometimes as high as an ordinary shrub or small tree, of great value in the desert regions of the western part of North America, where it occurs along with willow-bushes near springs of water. Its wood is used as fuel, and its pods, which are much liked by cattle and horses; the Indians, too, use them as an article of food.

Mezzanine. See ENTRESOL.

Mezzofanti, Giuseppe, Cardinal, a remarkable linguist, was born at Bologna, 17th September 1774. He was ordained priest in 1797, and appointed to the chair of Arabic at Bologna; soon after he was deprived because of his inability to take the oaths of the Civile Parliament, but was reinstated later. In 1831 he settled in Rome with the rank of Monsignore, and two years after succeeded Cardinal Mai as Keeper of the Vatican Library. In 1838 he was raised to the dignity of cardinal. He died 15th March 1840, at Rome. Mezzofanti's Education was acquired chiefly on his writings, but on the almost miraculous extent of his linguistic acquirements. Towards the end of his life he understood and spoke fifty-eight different tongues. As early, indeed, as 1820 Lord Byron called him a "living polyglot, a monster of languages, and a Urania of parts of speech." Yet he was not in the strict sense a critical or scientific scholar, or even otherwise a man of great intellectual power. See his Life by Russell (1857).

Mica (Lat. micae, 'to glitter'), the name given to an important group of rock-forming minerals, which have all a hardness of about 2, and are characterised by their perfect cleavage in one direction—the lamina being flexible and elastic. They are essentially aluminous silicates containing potash, or soda, or lithium, and in some species magnesia along with potash. They all crystallise in monoclinic forms which approximate closely to hexagonal and rhombohedral crystals. Muscovite or potash mica is a silicate of alumina and potash with some of the latter occasionally replaced by soda and small quantities of magnesia, ferrous oxide, and boric acid. It is seldom colourless, but usually, of yellow to greyish-brown or greyish-green, and is pearly or almost metallic. The thin plates into which it divides are generally transparent, and were formerly much used in setting objects for the microscope, but for this purpose thin glass is now preferred. It is still useful for the mounts of natural history objects which are to be put in spirit, being more easily bored than glass. Plates of muscovite often a yard across are found near Lake Baikal at Acworth in New Hampshire, and in China. Large plates also occur in Sweden and in Norway, and muscovite is widely used in glass with in Groß-Wall. In Siberia, China, Peru, and elsewhere is used as a substitute for glass in windows. It is sometimes preferred to glass for lanterns, especially for the fronts of stoves, as not liable to break with sudden changes of temperature. Muscovite and muscovoid cleavages are frequently painted in distemper on mica. Muscovite occurs as one of the essential constituents of ordinary granite, gneiss, and mica-schist. It is also a ingredient of many other phylitic rocks and crystalline schists, but is not a primary constituent of mica-schist. In this last it is as an alteration-product. Sericite is a tale-like variety of muscovite, not uncommonly met with as a constituent of certain schistose rocks.
MICAH

Michaelis, Johann David, one of the most learned biblical scholars of his century, was born on 27th February 1717 at Hallé, the son of Christian Benedict Michaelis (1680–1764), a theologian and orientalist of some distinction. After completing his studies at his native university, he travelled to England, passing through Holland, where he made the acquaintance of the orientalist Schultens. In 1745 he began to teach at Göttingen, and in the following year was

Michaelmas Daisy. See ASTR.

MICHELANGELO

Michelangelo, often Michael Angelo, Michelangelo Buonarroti, the most distinguished sculptor of the modern world, was born March 6, 1475. His father, Lodovico di Leonardo Buona-
roti Simoni, was a poor gentleman of Florence, who, though bankrupt in fortune, did not lack the consideration which is paid to ancient lineage. When the sculptor was born, his father was podestà or mayor of Caprese and Chiusi, two townships in Tuscany. He returned to Florence when his term of office was expired, and the child was entrusted to the fostering care of a stone-mason's wife at Settignano, where Ludovico owned a small property. The boy's enthusiasm for art revealed itself at an early age, and, though he was sent to the school of Messer Francesco di Uldino to learn the elements, his best energies were devoted to drawing. To his father's aristocratic prejudice sculpture seemed a calling unworthy of a gentleman. The lad, how-
ever, was resolute, and in 1488, while yet only thirteen years of age, he entered the shop of Domenico Ghirlandajo, to whom he was bound apprentice for three years. None was ever more famous than Michelangelo in the time and place of his birth. From his boyhood he was familiar with the masterpieces of Donatello, and he joined his contemporaries in making a pilgrimage to the convent of the Carmine, where he studiously copied the supreme examples of Masaccio's art. By Ghir-
landajo he was recommended to Lorenzo de' Medici, and entered the school which the 'Magnifici' had established in his garden on the Piazza. Here was gathered together, under the care of Bertoldo, a skilful but unformed artist, and many of the primitive works of Michelangelo encountered what proved the most enduring influence of his life. His talent was not long in arresting the notice of Lorenzo, who henceforth gave him a room in his house and a seat at his table; and to the benevolence of his patron he owed the acquisition of the antique style of Hellenistic art that he learned of the day. To this period belong two interesting reliefs. In the 'Battle of the Centaurs' (now in the Casa Buonarroti at Florence) the classical influence of Lorenzo's garden is strikingly apparent. In truth it has little of the dignified calm which distinguishes the work of Phidias and his contemporaries; the style of a later period was its inspiration; but it reveals the lasting characteristics of Michelangelo's genius. The inexhaustible variety of pose, the striding muscles, the contorted limbs, which mark the artist's treatment of his subject is in harrowing contrast to the 'Centaurs' is the 'Madonna,' conceived and executed in the spirit of Donatello, which without a suggestion of movement is quiet and harmonious in composition, and though not consciously antique is far more classical.

In 1496 Michelangelo had spent three years in his house, Lorenzo died, and the school which had conferred so great benefits upon art was straightway dissolved. Piero, Lorenzo's son and successor, it is true, retained for a time the services of Michelangelo, but he was not willing to have treated the sculptor with such consideration as he had previously given him. He was determined to send Michelangelo to Bologna. But did he here wait long for a patron? Gianfrancesco Aldrovandi commissioned him to execute a statue. In Bologna the sculptor lingered for a year; then he once more (in 1496) returned to Florence. It was during this sojourn in his native city that he fashioned the marble 'Cupid' to which he owed his first introduction to Rome. Baldassarre del Milanesi persuaded him to give the work the air of an antique by way of burial, and dispatch it to Rome. Here it was purchased by the Medici, who, though they speedily discovered the fraud which had been put upon them, was quick to detect the talent of the sculptor who had tricked him. He therefore summoned him to Rome, and on June 25, 1496 Michelangelo arrived for the first time in the Eternal City. The influence of the classical and antique is easily discernible in the 'Lucchus,' now in the National Museum at Florence; it is modelled with an elegance and restraint which are evidence of the hold which the classical tradition, as interpreted by the Greek-Roman sculptors, had upon Michelangelo. To the same period belongs the ex-
quisite 'Cupid' of the South Kensington Museum. The 'Pieta,' which is now in St Peter's, was executed in 1497, but presents an amazing con- trast. There is in it a touch of the middle ages, a suggestion of realism which is wholly at variance with the antique ideal. But it is beautifully com- posed, the drapery is handled with a masterly breadth, and the body of the dead Christ is an epitome of anatomical research.

For four years the sculptor remained in Rome, perpetually urged to return to Florence by his father, who was still anxious to have his son in the craft as unbiting of his station, nothing was lost to profit by the wealth which was the reward of artistic success. Michelangelo went back; and Soderini, who was then gonfaloniere, permitted him to convert into a statue the colossal block of marble upon which Agostino d'Antonio had been at work many years before, and out of
the irregular block grew the celebrated David. The sculptor was compelled to modify his composition on account of the shape and size of his material. Indeed, it is characteristic of this titan's impetuous genius that obstacles were ever an incentive. His David is the Gothic treatment of a classic theme. The influence of the antique is obvious, but the spirit of the Renaissance is most apparent (especially in such details as the treatment of the hands). The figure is modelled with strength and simplicity; the surface is not furrowed by an endless series of lines; there is no parade of anatomical knowledge; in pose and conception it is as a statue, as a thing of premeditated solemnity, which do not for an instant suggest that the artist was hampered by material difficulties. Indeed, so far from being a tour de force, it is a complete, well-ordered achievement. In 1504 it was placed upon its pedestal in the Piazza de' Signori; whence it was removed in 1873 to the Academy of Arts. Michelangelo's sojourn in Florence was a period of great activity. A second David (this time of bronze) was commissioned and sent to France, where all trace of it is lost. The sculptor showed admirable taste in the choice of the site for the statue to be passed into the possession of Sir George Bernamont, and is now at Burlington House. The Holy Family of the Tribune and the Manchester Madonna in the National Gallery belong to the same time, and prove that Michelangelo had not wholly neglected the study of annunciation; the Virgin, however, was essentially plastic. He had far more interest in form than in colour; indeed, in his hands pictorial art was but an opportunity for the vigorous modelling of the human form. Of the Sistine Chapel, the Belvedere, the Sforza, the Solasin; the galvanism, in the sense of art imported from Southern Europe, of decorating the Great Hall of the Council. For one wall Leonardo da Vinci was commissioned to design a fresco; a second was entrusted to Michelangelo. The latter chose as his subject an incident in the war of Pisa, and executed a cartoon which Vasari with devout exaggeration proclaims to have been of divine rather than of human origin. A body of soldiers were represented bating their arms; their camp had been attacked by the enemy, and they are hastening to seize their arms and repulse the assault. The men, in admirable taste, are observable as a group, for the variety of pose and the violent action in which he took peculiar delight. The fresco was never completed, and on the return of the Medici to Florence the cartoon was removed to the hall of their palace, to which painters were permitted unrestricted access. The result was that over-zealous admirers of Michelangelo cut the cartoon to pieces. The original is lost as irretrievably as the masterpieces of Zanxis and Apelles; and our impression of it is obtained from literary sources, from the engravings of Marcantonio and Agostino Veneziano, who reproduced single groups, and from a suspicious copy at Holkham Hall.

In 1503 Julius II. succeeded to the pontificate, and, being not merely a warrior but a patron of the arts as well, he lost no time in summoning Michelangelo to Rome. Before the sculptor could meet his match. The two men, indeed, were not unlike in temperament. Each was endowed with the extraordinary vigour of mind and body which was the best characteristic of the Renaissance. Both had the defects of their qualities; Michelangelo, no less than Julius was violent and over-bearing; the sculptor could as little brook opposition as the pope, and their dealings were continually interrupted by bitter quarrels and recriminations. It is impossible to accept Vasari's anecdotes as statements of the literal truth, but there is no doubt that they have solid foundation in fact. Had Michelangelo known the misery and disappointment which were in store for him, he might well have hesitated before accepting the commission of Julius. The pope commissioned the sculptor to design his tomb, and thus began what Condivi aptly calls la tragedia della sepoltura. For forty years Michelangelo clung to the hope that he would yet complete the great monument in honour of Pope Julius and his ancestors, but the obstacles were too formidable for him. Other demands were continually made upon his energy, and the sublime statue of Moses is the best fragment that is left to us of the tomb of Julius. However, at the outset both pope and sculptor were full of enthusiasm. The plans were discussed and the work begun; but at once proceeded not the sculptor one day asked audience of the pope in vain. In a sudden fit of temper Michelangelo left Rome, and the entreaties of the pope availed not to procure his return. After much fruitless negotiation they met at Bologna, and, with the generosity that was characteristic of both, were instantly reconciled. Michelangelo, as a pledge of renewed friendship, commenced a statue of Julius II., which was cast in bronze and placed over the gate of San Pietro in Montorio (afterward converted into a church and then into a ruin). Michelangelo followed the pope to Rome, eager to resume his work upon the monument. In the meantime, however, Bramante, if Vasari's account be true, had poisoned the pope's mind against the sculptor; instead of being allowed to devote himself to the monumental work, which he deemed the work of his life, he was ordered to decorate the ceiling of the Sistine Chapel with paintings. In vain he protested that sculpture was his profession; in vain he urged Raphael's higher qualifications for the task; the pope was obstinate, and in 1568 Michelangelo began the work for which his training had ill adapted him. However, he set himself resolutely to the toil, and in four years achieved a masterpiece of decorative design. The flat oblong space of the ceiling is divided into nine compartments, each of which contains an incident drawn from the Old Testament. The lunettes above the windows, the spandrels, as well as the ressaltars between the lunettes, are filled with heroic figures. The designs are admirably accommodated to the space they are intended to fill, and the colour schemes are characterised by the lightest brushwork. It is only when you analyse the composition and examine each compartment by itself that you realise the superhuman invention, the miraculous variety of attitude and gesture, which place this marvellous work among the greatest achievements of a man's energy. Michelangelo, however, had not forgotten the monument of Pope Julius, and no sooner had he finished his work in the Sistine Chapel than he returned with eagerness to the tomb. But once again his favourite project was interrupted. In 1513 Pope Julius II. died, and, though he had commanded the cardinals Santi Quattro and Aginense to see that his monument was completed in accordance with his expressed wishes, the cardinals were thriftv men, and demanded of Michelangelo another and a more modest design. This was furnished, but before the work could be proceeded with Pope Leo X. had despatched Michelangelo on business of his own to Florence. Leo was of the Medici family, and professed no interest in the tomb of his predecessor; his whole anxiety was to do honour to his ancestors by the adornment of the family church. He therefore commissioned Michelangelo to rebuild the facade of the church of San Lorenzo and enrich it with sculptured figures. The master reluctantly complied, and set out for Carrara to quarry marble. Even here the pope would not permit Michelangelo to work his will, but urged him to leave Carrara and seek what material he needed at Serravezza, which lay in Leo's own territory. In vain the sculptor
Michelangelo insisted that the marble was of inferior quality, and that to convey it to Florence roads must be cut through mountains and laid upon stakes year after year. Nevertheless, for two years and for eight years Michelangelo was forced to devote himself to toil as idle as that of Sisyphus; from 1514 to 1522 his artistic record is a blank. Nor were the next years fruitful of achievement. The sculptor remained in Florence, still working on the tomb of Julius the first building of the Sacristy of San Lorenzo. In 1528 the unsettled state of his native city turned him again from the practice of his art. He devoted himself heart and soul to the science of fortification, and when in 1530 Florence was besieged Michelangelo was foremost in its defence. The city was forced to surrender in the following year, and for some time Michelangelo, fearing treachery, lay in concealment. His safety, however, being assured, he resumed his work upon the tombs of the Medici, and completed the monument to Giuliano, that Lorenzo had seen Michelangelo, which are among the greatest of his works. In 1533 yet another compact was entered into concerning Pope Julius’s ill-fated sepulchre; it was at last determined to reduce it to a mere façade, and Michelangelo would doubtless have carried it to completion had he not been decapiated of too many, the Sistine Chapel with frescoes. After a delay of some years he began in 1537 to paint ‘The Last Judgment.’ The design was finished and displayed on the Christmas-day of 1541, and was the master’s last pictorial achievement. In the following year he was appointed architect of St. Peter’s and devoted himself to the work with loyalty and devotion until his death, which took place on the 18th February 1564.

Michelangelo is by far the most brilliant representative of the High Renaissance. He was not only supreme in the arts of sculpture and painting, but was learned in all the learning of his age, a poet of powerful individuality, an architect and military engineer. From an artistic point of view his was by far the greatest personality, his the most potent influence: De Piles ranks him with the ancients. To the antique was immense, yet it must be remembered that he knew only the decadence of classical art; had he seen the masterpieces which have since been brought to light, it is possible that his style might have been largely modified. But, though the example of his art enjoyed his influence is conspicuous, he was rarely able to exclude his personality. As he was violent in his life, so there is ever a touch of violence in his art. He is making as it were, an emphatic protest against the dark ages which lay behind him; he is discovering the world with its utmost possibilities of the reawakened arts. There is generally to be observed in his works a profound learning, an extraordinary knowledge of perspective and foreshortening, a firm conviction that there is nothing in heaven or on earth that art cannot express. At beauty Michelangelo does not aim. Grandeur, splendour, power, these are his themes. And his recurs to them again and again with the persistence which characterises a man of transcendent genius. Both Donatello, who came before Michelangelo, Raphael, who lived after him, and his contemporaries, were more richly endowed than he with the artistic temperament. Neither the one nor the other was wont to overstep the limits of art. Their ambition was to attain perfection; they did not care what the restraints imposed by beauty and simplicity. Michelangelo, through their inferiority in art, had a far greater, if less governable, genius. He was not content to model a perfect statue, to paint a perfect form; he was ever striving to throw himself and his intelligence into marble or on to canvas. And so, though his works will be ranked till the end of time among the masterpieces of the world, he is neither for sculptor nor for painter. He was the possessor of a genius in which he was more potent than any of his contemporaries, and it can hardly be said that his influence was wholesome. The Flemish and Dutch painters, who visited Italy in the 16th century, carried home with them of distorted limbs and twisted draperies, but failed to catch a breath of that invention and vigour. It is easy, even for the mediocre, to parody a strongly-marked talent.

The master’s career is not without irony. His genius was plastic; by temperament and training he was a sculptor, and yet frescoes were the only works he was destined to bring to full perfection. He has left behind him, it is true, not a few grandiose statues, such as the ‘Moses,’ but none of his elaborate designs for sculptural monuments was ever completed. His career, indeed, was, until he came for the last time to Rome, a prolonged struggle against fate and against his masters. Before time after time his own projects were set aside at the pleasure of a pope. For this his own waywardness and erraticity were in some measure to blame, and throughout his life he seems to have been unable to attack any enterprise except at fever-heat. His successes and accomplishments were disputed; his life, which the artist and the man, reserved for his old age, possess the same qualities as his statues. Just as his ‘David’ was torn from the marble, so his verses are rough-hewn out of the language. In all of them it is meaning rather than form that is sought after. Dr Johnson’s description of them is applicable to them. ‘These are the forced verses of a man of a strong mind, but not accustomed to write verse.’ The best of them were inspired by his friendship for the accomplished Vittoria Colonna, the widow of the Marchese di Pesaro. Michelangelo’s life was untoned by the passion of love, and his one romance belongs to his old age. He is said to have met Vittoria for the first time in 1538, and until her death, which took place in 1547, the closest ties of friendship bound them. Her loss was the nearest blow which ever fell upon him. He painted her portrait, and this honour he conferred on none other save Tommaso Cavaliere, for whom he cherished a romantic attachment and to whom also he addressed sonnets. Michelangelo’s character was a strange medley of conflicting qualities both beneficent and loyal to those who depended on his care—as is proved by his untried interest in his nephew and his devotion to Urbino, his faithful servant—he showed himself resentful and even suspicious to his enemies. He could brook no opposition to his wishes, and he mercilessly attacked those who dared to withstand him. But he lived in an age of treachery and intrigue, and much may on this count be forgiven him. He loved solitude and a simple life. From his earliest youth he was an eager student of literature, and applied himself with peculiar devotion to the Latin classics. To Virgil he rendered by the anxious among his contemporaries, he earned his full meed of praise during his lifetime, and at his death universal honour was paid to his memory. See Lives by Vasari and Condè. The best edition of the letters is Milanese’s Lettere di Michel Angelo (1673), which has since been edited and published by Michelangelo Buonarroti (1863), and translated into English by J. A. Symonds. Of modern and critical biographies there is no lack. The best and most compact is that of M. Laffitte, in 3 vols., 1863. Another good work is Michelangeolo (2d ed. 1863); Hermann Grimm’s Leben Michelangelo’s (5th ed. 1879) includes much that is valuable, but it is diffuse and not a little sentimental.

Michellet. Jules, a great French historian, was born a printer’s son at Paris, 21st August 1798. After a brilliant course of study under Vilemin
and Leclerc, he became at twenty-three a professor of History in the Collège Rollin. Later he lectured at the Collège Sainte-Barbe and the Ecole Normale, and after the revolution of 1830 was given an important live to earn a living. As a historian (3 volumes) wrote 200,000 words on Guizot at the Sorbonne, and tutor to the Princess Clémenceine. In 1838 he was elected to the Academy, and at the same time became professor of History at the Collège de France. Already he had made his name known by admirable handbooks on all antiquity and his new history. He commenced the monumental work which was to give him an illustrious place among great historians, his Histoire de France (18 vols. 1833-47; new ed. 19 vols. 1879), the labour of about forty years. Other works were Origines du Droit Français cherchées dans les Symboles et Formulaires du Droit Universel (1837), Mémoires de Luther (1845), and Proces de Templiers (1841-51). Michelet had a great dislike for priests, but especially for the Jesuits, and he now plunged into controversy with all the impetuosity of his nature and eloquence, a man of all the famous powers of sarcasm and all his unrivalled knowledge of history. Three books were the fruits of his polemic: Des Jésuits, written in conjunction with Edgar Quinet (1843); Le Prêtre, le富民e, et la France (1863); and Leclerc, leïvre (1868). Next followed his famous Histoire de la Révolution (7 vols. 1847-53; centenary ed. 5 vols. 1889), which is not a good history with all its eloquence and enthusiasm. Before its conclusion Michelet had lost his office by refusing to take the oath to the alleged fatal constitution. He then gave his greatest years to the writing of the great Revolution. The second installment continues to the close of the Revolution. In the last years of his life he set himself to complete his task, and thus bequeathed a great continuous history to France, but he did not see the end of his work. (see above). He died at Ilyères, 9th February 1874.

Michelet ever treats history from a personal point of view, and his imagination is prone to bring into undue relief striking figures and dramatic scenes and incidents. Thus his work is a series of tableaux, as these were visible to the eyes of a man of genius, full of prejudices for and against his pupils, and destitute of the sense for historical perspective. Yet the whole stands out a masterpiece of genius, instinct with life, and the whole range of historical literature must be ransacked for specimens of its imitation, from Hugo's epic, the chronicles of Joan of Arc, the Templars, or the immemorial geographical survey of France with which the work opens. See the books by G. Monod (1875), Noël (1878), Corréard (1896), and Jules Simon (1889).

Michigan (Chippewa-Indian Mitche Sauypegwe, or Simply the Michigan) is third in size of the five great fresh-water lakes of North America, and the only one lying wholly in the United States, having Michigan on the N. and E., and Wisconsin on the W. It is about 335 miles long, and from 50 to 89 broad, the mean depth is 923 feet, the maximum amount is 870. It has the same elevation as Lake Huron (with which it is connected by the Strait of Mackinaw)—581.5 feet above sea-level; this is 204 feet lower than Lake Superior, and 8.5 feet above Lake Erie. Its surface area is 22,450 sq. m., or 1350 less than that of Lake Huron; but its drainage area—57,700 sq. m.—is 6000 sq. m. greater than that of Lake Huron. P. The north-western end, 15 miles long, is a spring-tide of about 3 inches. The shores of Lake Michigan, which are guarded by a number of lighthouses, are for the most part level and low; the annual erosion amounts to about 3 feet. Its principal harbours are those of Chicago, Milwaukee, and Racine: See the Chicago Guide, and the Nautical Chart of the Great Lakes (Milwaukee, 1888).

Michigan, a state of the American Union, the nineteenth in area and ninth in population, and having a pop. of 30 per sq. m., is in 41° to 48° 20' N. lat. and 82° 30' to 90° 22' W. longitude. It has an area of 58,915 sq. m., or more than that of England and Wales: 1114 sq. m. are occupied by 573 small lakes, while the surface of 179 islands and islets, from one acre upwards, measures about 633. The coast-line in navigable lake waters is 1854 miles. The state is bounded on the E. by Indiana and Ohio; on the N. by Lake Superior, on the W. by Wisconsin, and on the S. by Michigan. From its north-western point at the mouth of Montreal River to the extreme south-east on Maumee Bay is about 500 miles. It is sometimes called the Peninsula State, from its formation in two great peninsulas, the upper and lower Lake Michigan, which reach an extreme length of 318 and width of 164 miles, the lower of 277 and 197 miles; the latter includes the Huron Peninsula, or the 'thumb' of the 'nitten,' in eastern Michigan, and the small Leelanau Peninsula in the north-west. The eastern part of the other, looking toward St. Mary's River, is sometimes called St. Mary's Peninsula. Keweenaw Peninsula, bearing the great copper-mines, stretches far north into the waters of Lake Superior; and on the south, near Mackinac Island, is the little but picturesque St. Ignace and Mackinac Peninsula. The soil is generally rugged, broken, rocky, and comparatively barren, though teeming with mineral wealth; but hopefull beginnings of agriculture have been made in the eastern half of it. In the north-west, near Lake Superior, is the highest peak in the state, the woods known as the Porcupine Mountains (1830 feet above the sea). The famous Mineral range passes south of this, from Keweenaw Point south-westward into Wisconsin; but it is merely a gentle swell from both sides, nowhere really mountainous. No part of the lower peninsula is more than 1780 feet above sea-level; and the mean height is only 190 feet above the environs of waters of the lakes. The highest part of Detroit is but 75 feet above the river at this point, and the uplift of a few feet in the adjacent river and lake beds would raise it a thousand square miles of lake Michigan. This soil is mainly formed by the glacial drift, in alternated clay, sand, and gravel beds, supplying all the chemical constituents of a good soil, and enabling the growth of all crops adapted to this climate. The mean annual temperature is 40° F. (summer, 68° F., winter, 23° F.); the annual rainfall is 35.8 inches. Both peninsulas, with occasional exceptions of swamps or small prairies, were originally covered with dense forests, the products of which have proved exceedingly valuable. The geology of the state is highly interesting; it represents every rock series known, from the oldest strata to the top of the Carboniferous. In the west of the upper peninsula, on the Wisconsin border, are the Laurentian, and on either side and
eastward the Huronian formations, in which are the great deposits of iron ore. The Mineral range is of eruptive or volcanic rock, with older strata tilted upon its sides. Farther eastward are the long belts of the lower peninsula, cutting off the trap from Green Bay through the St. Mary's Peninsula. The lower peninsula is compared, geologically, to a nest of wooden dishes. Its centre is a coal-bearing area of about 5000 sq. m., carrying, however, comparatively little coal of economic value in workable place and shallow depths. The iron ore, however, is one of the mineral wealths of the state. Iron ore was found in 1829 and 1830. It is mined on the shore of Lake Huron; and other groups yield valuable mineral products.

The output of salt for 1889 was 9,500,000 barrels, the number of wells 234. In salt and timber Michigan leads the United States, and in iron and copper the world. The great Calumet and Hecla copper-mines, the largest operated, with perhaps one exception, are on the Keweenaw Peninsula. The annual copper output in 1890-93 averaged over 45,000,000 lbs. The copper is much used for some purposes unequaled. In 1896, 5,856,169 long tons of iron ore were mined, mainly in Marquette county. Some gold is found in the upper peninsula, and silver and lead in small amounts. Gypsum appears in immense deposits at Grand Rapids, in the chief city, and in Kalamazoo (42,345). Other minerals are sand (there are 2,093,989) and silica (14,859). The output of salt for 1890-93 averaged over 45,000,000 lbs. The copper is much used for some purposes unequaled. years later he was deprived of his chair, having given offence to the government of the day in political utterances in his lectures. For some years he lived a hard and unsettled life—in 1848 he was in Italy, helping to organise the Polish legion that fought side by side with the Italian republicans at Rome—until in 1852 Louis Napoleon appointed him a librarian in the National Library at Paris. He died 28th November 1855 at Constantinople, whither the French government had sent him to organise a Polish legion to fight against Russia. His body was taken to France and buried at Montmorency; but in 1890 his bones were transported to his native country and laid beside those of Koseiusko in the cathedral of Cracow. Mickiewicz is pre-eminently the national poet of the Poles; and next after Pushkin the greatest of all the poets of the Slavs. His collected works were issued at Paris in 11 vols. (1860-61), at Leipzig in 5 vols. (1862-69), and at Lemberg, a popular edition, in 4 vols. (1855 et seq.). See Life by his son Ladislas Mickiewicz (1888), Fontille (Mainard) (1862), both in French, and an anonymous one in German (1857); also the Memoirs of Herzen.

Mickel, William Julius, translator of the LeidenPOSITIONS into English, was born in Hampshire, in 1734. He was educated at Edinburgh High School, failed in business as a brewer, and next went to London to make a living by writing. In 1763 he published his would-be Spenserian poem, The Concubine (in its next edition entitled Syr Martyr), and so prepared the way for his version rather than translation of the Lusiad of Camoens (1771-75), which he completed during four years' seclusion in a farmhouse. In 1779 he went to Lisbon as secretary to Commodore Johnstone, but his last years were spent in London, where he died in 1788. Of his works and their importance, his ballad of Cunnor Hall, which suggested to Scott the romance of Kenilworth, is poor stuff, but the delightful song, 'There's nae luck about the house,' is long since safely assured of its immortality. An attempt has been made to ascribe this song to the ill-fated Greenock postmistress, Jean Adam (1710-68), but her claim will not bear serious examination. See Atheneum for January 27, 1877. The best edition of Mickel's poems is that edited, with a Life, by the Rev. John Sim (1806).

Micmacs, a tribe of Algonquin Indians, the first Nasquonians to come in contact with the English and their colonies till 1670. They now number from 3000 to 4000, and are mostly in Nova Scotia, Newfoundland, and New Brunswick. There is an English-Micmac Dictionary (Halifax, 1888), compiled by the late Dr. T. D. Hall.

Microbe, Microcosmus. See Bacteria, Germ, Microcine. See Felspar.

Microcosm and Macrocosm. The belief of the ancients that the world or cosmos was animated, or had a soul (see ANIMA MUNDI), led to the notion that the parts and members of organic beings must have their counterparts in the members of the universe. This notion was given in the 6th century, and considered the world as a human organism on the large scale, and man as a world, or cosmos, in miniature; hence they called man a microcosm (Gr., ‘little world’) and the universe itself the macrocosm (‘great world’). With this was associated the belief that the vital movements of the microcosm exactly corresponded to those of the macrocosm, and represented them as it were in copy. From this it was easy to transition to the further assumption, that the movements of the stars exercise an influence on the temperament and fortunes of men (see Astrology). Heylin gave the title Microcosmus to a work on cosmography in 1621, and Lotze entitled his great work definitive of man's position in the universe Microcosmus (1856-64).

Microcosmic Salt is used in blowpipe analysis, and may be prepared by mixing concentrated solutions of phosphate of soda and chloride of ammonium. It has the composition NaNH₂₆[P₂O₁₀₄]·4H₂O.

Microlestes, the name given to the earliest known manaulian form—a marsupial; it is discovered in the Trias of England and of Württemberg. Only the teeth, which are of small size, have been met with.

Micrometer (Gr. mikros, 'little'; metron, 'measure') is an instrument used for the measurement of minute distances and angles. Its different forms, depending on different principles, may be divided into two, according to which they are applied to physics or astronomy. Of the former species are the Vernier (q.v.) and the Micrometer Screw, the latter instrument being merely a screw with a very regular thread, and a large round head, which is carefully graduated, generally to sixtieths, and furnished with a tuft of hairs by an index to a complete turn of the screw advance its point y of an inch, a turn sufficient to pass the index from one graduation to another will only advance it y2 of an inch, &c. This is the micrometer used in the construction and graduation of instruments. Of the latter species the astronomical purpose for the most simple is a short tube, across the opening of which are stretched two parallel threads, which are moved to or from each other by screws. These threads are crossed by a third perpendicularly, and the whole apparatus is placed in the focus of a lens. The distance of two stars is found by adjusting the two parallel threads, one to pass through the centre of each star, taking care that the threads are placed perpendicular to the line joining the stars, and finding how many turns and parts of a turn of the screw are required to bring the threads to the same point. The angle of position of two stars is also obtained by turning round the instrument till the third wire, which is normally horizontal, bisects both stars, and reading off on the circumference the arc passed over. Fraunhofer's suspended annular micrometer consists merely of a steel ring, round which is a thin rim of glass, and the position of the star is deduced from the time when it crosses the ring and its path while within it. The Abbé Rochon substituted for the wire micrometer one made of two prisms of rock-crystal or Iceland spar, capable of double refraction.

Microphone. This instrument, invented in 1878 by Professor Hughes, does for faint sounds what the microscope does for matter too small for sight; the fall of a bit of tissue-paper or the tread of a fly being rendered audible at many miles' distance. One applied to the ear sustains the ear drum, and the microphone action is willow-charcoal, plunged in a state of white heat into mercury. The theory is that in a homogeneous conductor of electricity the compressions and dilatations of the molecules balance each other, and no variation of current continues; while, with a state of fine grain, due to the homogeneity of the conductor, variations of pressure in the conductor produce variations in its conducting power, and thus induce variations in the strength of the electric current traversing it; and these variations are heard when they pass through a second similar conductor, induce corresponding variations in its molecular stresses,
which may act upon the surrounding air and give rise to sonorous waves; or the variations in the current may be detected by the Telephone (q.v.). One form of microphone consists of a piece of mercury-tempered carbon, an inch long, placed electrically between two carbon-blocks bolted to receive its ends; wires connect the blocks with the battery and with the receiver by which the sounds are to be heard. ‘A piece of willow charcoal,’ says the inventor, ‘the size of a pin’s head is sufficient to reproduce articulate speech.’

Two wires laid parallel on a third nail laid across them, make a simple form of microphone. A few cells of any form of battery may be used. Many useful applications of the microphone have been made or suggested.

**Microscope** (Gr. mikros, ‘small;’ and skopeo, ‘I see’) is an instrument for enabling us to examine objects which are too small to be almost or quite indiscernible by the unaided eye. Its early history is obscure; but, as it is quite evident that the property of magnifying possessed by the lens must have been noticed as soon as it was made, we are quite safe in attributing its existence in its simplest form to a period considerably anterior to the time of Christ. It is generally believed that the first compound microscope was made by Zacarias Jansen, a Dutchman, in the year 1590, and was exhibited to James I. in Scotland in January 1609. One of the first microscopes was made by Dr. Fabri in 1619. It was then a very imperfect instrument, colouring and distorting all objects. For many years it was no more than a useful instrument, and it was not until the invention of the achromatic lens by Chestermoor Hall (1729) and John Dollond (1752-37) that the perfection of the microscope by Lister and others, that it reached the advanced position it now occupies among scientific instruments.

An object to be magnified requires simply that it be brought nearer to the eye than when first examined; but as the focal distance of the eye ranges from 6 inches to 14 inches—10 inches being the average focal distance—it follows that a limit to the magnifying power of the eye is attained whenever the object to be examined is brought too near. If, however, we place a card, and pierce a hole in it with a fine needle, and then examine a minute object, as, for instance, the wing of an insect held about an inch from the card, we shall see it distinctly, and that, too, magnified about ten times its size. This is explained by the fact that the pin-hole acts as a lens, the image of the object being focused on the retina, and the eye can convert it sufficiently on the retina to produce a distinct impression, which is faint; and did not the blackened card exclude all other light it would be lost. If we now remove the blackened card without either moving our eye or the object under examination, it will be found that the insect’s wing is almost invisible, the unassisted eye being unable to see clearly an object so near as one inch; thus demonstrating that the blackened card with the needle hole in it is as a magnifying instrument as well as a number of lenses.

In Fig. 1 AB is a double convex lens, in front of which, between it and its focus, K, but near that focus, we have drawn an arrow, EF, to represent the object under inspection. The rays drawn from its surface are supposed to be those of light, diverging from these points and falling on the lens. These rays, if not interrupted in their course by the lens, AB, would be too divergent for the eye to bring them to a focus upon the retina (see EYE). But after traversing the lens, AB, they travel, if the object be sufficiently near the point of rays, K, in lines which are nearly parallel, or which apparently diverge from points, such as C, D, not nearer to the eye than the least distance of distinct vision, which is, for most individuals, about ten inches. Suppose the lens is as close as may be to the eye, and that the object, EF, is brought up to it to such a distance that the virtual image, CD, is at 10 inches’ distance from the eye; we may further suppose that the focal length of the lens is such (see LENS) that the image, CD, is ten times, linearly, as great as EF; then the eye, instead of vainly striving to see the distant object, EF, near K, will seem to perceive distinctly an image in ten times as great linearly, and situated at the convenient distance, H. The magnification of the lens is independent of the eye, and is the relation between the size of the image and that of the object. When one of these is known, and the other is given, the third may be found.

The magnification of the microscope depends upon the position of the eye, and is the ratio between the apparent size of the object at any given distance and that of the virtual image as seen with the aid of the lens; this may be seen to increase as the eye is withdrawn to a greater distance, especially when the one eye is used to look at the object, say a page of print, and the other to look through the lens; but the greatest retinal image is formed when the lens is close to the eye.

We have supposed the whole of the light to enter the eye through the lens, AB (fig. 1); but so large a pencil of light passing through a single lens would be so much distorted by its spherical figure, and by the chromatic dispersion of the glass, as to produce a very indistinct and imperfect image. This is partly rectified by applying a stop to the lens, so as to allow only the central part of the pencil to pass. But, while such a limited pencil would represent correctly the form and colour of the object, so small a pencil of light is generally unable to illuminate the whole of the magnified picture with any adequate degree of brilliancy, and is therefore inadequate for the study of objects, such as insects, or plants which are often of so much importance in distinguishing one class of objects from another. Dr Wallaston was the first to overcome this difficulty, which he achieved by constructing a doublet (fig. 2), which consists of two plano-convex lenses, having their focal lengths in the proportion of 1 to 3, and placed at a distance best ascertained by experiment. Their plane sides are placed towards the object, and the lens of the shortest focal length next the object. By this arrangement the distortion caused by the first lens is corrected by the second, and a well-defined and illuminated image is seen. Dr Wallaston’s doublet was further improved by Mr Holland, who substituted two lenses for the first in Dr Wallaston’s doublet, and retained the stop between them and the third. This combination, though generally called a triplct, is virtually a doublet, inasmuch as the two lenses only accomplish what the anterior lens did, although with less precision, in Dr Wallaston’s doublet. In this combination (fig. 3) of
lenses the errors are still further reduced by the close approximation of the lenses to the object, which causes the refraction to take place near the axis, and thus we have a still larger pencil of light transmitted, and have also a more distinct and vivid image presented to the eye.

**Simple Microscope.**—By this term we mean an instrument by means of which we view the object through the lens directly. These instruments may be divided into two classes—those simply used in the hand, and those provided with a stand or frame, so arranged as to be capable of being adjusted by means of a screw to the exact focal distance, and of being moved over different parts of the object. The single lens used may be either a bi-convex or a plano-convex. When a higher power is wanted a doublet, such as we have already described, may be employed, or a Coddington lens, which consists (fig. 4) of a sphere in which a groove is cut and filled up with opaque matter. This is perhaps the most convenient hand lens, as it matters little, from its spherical form, in what position it is held. In the simple microscope single or combined lenses may be placed in a diagonal or quarter-inch tube. There are many different kinds of stands for simple microscopes made, but, as they are principally used for dissection, the most important point next to good glasses is to secure a firm, large stage for supporting the objects under examination. When low powers are used the stage-movements may be dispensed with; but when the doublet or triplet is employed some more delicate adjustment than that of the hand is necessary.

**Compound Microscope.**—In the compound microscope in its simplest form the observer does not view the object directly, but an inverted real image or picture of the object is formed by one lens or set of lenses, and that image is looked at through another lens. The compound microscope consists of two lenses, an object and an eye lens; but each of these may be compounded of several lenses playing the part of one, as in the simple microscope. The eye-lens, or ocular, is that placed next the eye, and the object-lens, or objective, that next the object. The objective is generally made of two or three achromatic lenses, while the eye-piece generally consists of two plano-convex lenses, with their flat faces next the eye, and separated at half the sum of their focal lengths, with a diaphragm or stop between them. Lenses of high power are so small that a very small beam of light, and consequently what is gained in magnifying power is often worthless from deficient illumination. Various devices have been employed to overcome this difficulty. The light may be concentrated by achromatic condensers placed beneath the stage, or the curvature of the lens may be such as to allow as large a number of divergent rays as possible to impinge upon it. Such a lens is said to have a large 'angle of aperture,' the angle of aperture being that made by two lines converging from the margins of the lens to its focal point. Recently lenses termed comparison lenses, have been constructed, of such a curvature that when immersed in a drop of liquid placed over the object light is admitted on all sides. With an immersion lens there is high magnifying power with sufficient illumination.

The accompanying diagram (fig. 5) explains the manner in which the complete compound microscope acts. We have here represented the triple achromatic objective, consisting of three achromatic lenses combined in one tube, in connection with the eye-piece, which now consists of the field-glass, FF, in addition to the eye-glass, EE. The function of the field-glass, FF, is that the rays of light from the object tend, after traversing the objective, to form an image at AA; but coming in contact with the field-glass, FF, they are bent, and made to converge at BB, where a real image is formed, at which place a stop or diaphragm is placed to intercept all light, except what is required to form a distinct image. From BB the rays proceed to the eye-glass, EE, exactly as they do in the simple microscope. The real image formed at BB is therefore viewed by an original object through the eye-glass, EE. The lens, FF, is not essential to a compound microscope; but as it is quite evident that the rays proceeding to AA would fall exterior to the eye-lens, EE, if it were removed, and only a part of the object would thus be brought under view, it is always made use of in the compound microscope.

A mirror is placed under the stage for reflecting converging rays from the object under observation. This method of illumination by transmitted light is used when the object is transparent. When opaque, light is reflected on the object by a bull's eye lens, called a condenser. The best instruments are supplied with six or seven object-glasses, varying in magnifying power from 20 to 2500 diameters. The eye-pieces supplied are three in number, each of which consists of two plano-convex lenses, between which a stop or diaphragm is placed, half-way between the two lenses. As the magnifying power of a compound microscope depends on the product of the magnifying powers of the object-glass and the eye-piece, it follows that its power may be increased or diminished by a change in either or both of these glasses. In the mechanical arrangements it is of importance to have the instrument so constructed that, while every facility is afforded for observation and easy adjustment, there should also be great steadiness. These ends are achieved in various ways, of which fig. 6 is one of the simplest: a, brass stand, supported on three feet; b, mirror supported on trunnions; c, diaphragm, pierced with circular holes of various sizes, to regulate the admission to the object of reflected light from the mirror; d, stage-plate, on which the object is placed; e, screw, with milled head for fine adjustment; f, the object-glass or objective; g, brass tube in which the body of the instrument is moved,
so as to effect the coarse adjustment; 4, the eyepiece, or ocular.

For a more complete account of the different kinds of microscopes, and the various purposes to which they are applied, see Quckett On the Microscope (1885); Carpentier (1862), 4th ed. (1880); works on the microscope by Hogg and Beale, The Microscope, by Wythe (3d ed. 1877).

Microtome, an instrument for cutting thin sections of portions of plants and animals preliminary to their microscopical examination. The objects to be cut are imbedded in some material such as paraffin or other substances, in which sections, by the slicing of minute or delicate objects readily feasible. The cutting used to be done by holding the prepared object in one hand and wielding a razor in the other, but this method, apt to yield sections of unequal or insufficient thinness, has given place to the use of some form of microtome, which is at once quicker and more effective. These instruments are quite simple devices by which a sliding razor slices a fixed but adjustable object, or by which the object is made to move up and down across the edge of a razor. As typical forms they may be divided into that of Hatherford and others; the sliding microtomes common on the Continent; the ingenious 'Rockier' of the Cambridge Instrument Company—a favourite instrument in British laboratories; and more elaborate and automatic machines manufactured by the same company.

Midas, a common name of the ancient Phrygian kings, most famous of whom is Midas, son of Gordius and Cybele, and pupil of Orpheus. For his kindness to Silenus he was promised by Dionysus whatever he should ask, and in his folly he asked that everything he touched should become gold; but, it being objected he touched was at once covered with gold, he was soon fain to implore the god to take back his fatal gift. He was told to bathe in the springs of the Pactolus, and from that day to this its sands have yielded grains of gold. Once, when Apollo and Pan were engaged in a musical contest, the lyre of the former was made to break, and Midas was called in to decide between them. He gave the palm to Pan, whereupon Apollo changed his ears to those of an ass. He concealed the deformity under his Phrygian cap, but could not hide it from his barber, who felt so heavy the burden of a secret he dared not reveal, that he left the house and, with tears in his eyes, went to Midas and whispered into it, 'King Midas has ass's ears. He then filled up the hole, and his heart was lightened; but out of the ground sprung up a reed which ever whispered the shameful secret to the breeze.

Middleburg, capital of the Dutch province of Zeeland, in the island of Walcheren, and 43 miles by rail N.E. of Flushing. In former times it was one of the leading mercantile cities of the United Provinces, sending many ships to the East and West Indies, and the Levant (Thomas Cromwell was one of its merchants); but its commercial importance has greatly declined, except for its sugar, cotton, tobacco, corn, and madder. Cotton-factories represent its only industry of note. The town-house, founded by Charles the Bold in 1485, is adorned with twenty-five statues of counts and countesses of Holland and Zealand. A once celebrated abbey (founded in the 12th century) is now used as administrative offices. The museum of the Academy of Sciences contains one of the earliest telescopes made by Lipperhey, a native of the town, who, there are good grounds for believing, was the original inventor of the instrument. The new church has marble monuments to the sea-heroes, J. and C. Evertson, who were killed fighting against the English in 1666. Pop. (1893) 17,560.

Middlesex

Middle Ages is the collective term for the centuries that intervened between the close of classical times and the dawn of the modern epoch. The term does not apply to Asiatic history, except in part, in the Orient. By general acceptance, the Middle Ages are considered to begin after the overthrow of the Western Empire of Rome in 476, and to terminate at the Reformation, in the first quarter of the 16th century, or even earlier, in the last half of the preceding century, when printing was invented, America discovered, and the Renaissance movement was called forth by the Greek refugees from Constantinople.

Middle Level. See Bedford Level.

Middlesbrough, a great iron-manufacturing and shipping centre in the North Riding of Yorkshire, is a municipal, parliamentary, and county borough, and capital of the district of Cleveland. It is on the south bank of the Tees near its mouth, 18 miles by rail N.E. of Darlington, 50 N. of York, and 940 N. by W. of London. In 1826 the site was occupied by a solitary farmhouse surrounded by marshy land; the town owes its remarkably rapid growth partly to the extension thither (in 1830) of the Stockton and Darlington Railway, but mainly to the discovery of iron ore in the Cleveland district. By the 1840’s the Cleveland iron industry—that of boring salt—was added in 1880. There are here iron and steel works, blast-furnaces, chemical works, wool and iron shipping-buildings, sawmills, marine engineering works, wire, nail, and tube works, salt and soda works, &c. Of the total British production of iron Cleveland contributes nearly a fourth; the make of pig-iron in Middlesbrough rose from 964,000 tons in 1870 to over 2,000,000 tons in 1893. At the shipbuilding yards 3000 men are employed. The export of coal is extensive. Here are a space dock (1859-60); Chubley (1875) at a cost of £120,000; and the South Gare breakwater (1864-88), nearly 23 miles long. There are, besides Anglican churches and Nonconformist chapels, a Catholic cathedral and a Jewish synagogue. The town-hall and municipal buildings were erected at a cost of £250,000, and were opened in 1889 by the Prince and Princess of Wales. Among other public buildings are a market-house, corporation baths, banks, workhouse, royal exchange, high school, &c; and there are theatres, clubs, masonic and temperance halls. The Albert Park of 72 acres was given to the town by Mr B负责同志 of the town. Mr Bolckow (1806-78), the first mayor and member of parliament; on the celebration of Middlesbrough Jubilee in 1881 a monument to Mr Bolckow’s memory was unveiled. There is also a monument in Exchange Place to Mr Vaughan, the founder of the Cleveland iron trade. The first governing body was established in 1841; the borough was incorporated in 1853; and since 1867 Middlesbrough returns one member to parliament. The area of the municipal borough is 2813 acres; of the parliamentary borough, 4,715 acres. Pop. of the town (1891) 23,821; (1891) 53,314; (1811) 5463; (1831) 7631; of municipal borough (1801) 18,892; (1871) 39,824; (1881) 55,283; (1891) 75,316. See H. G. Reid’s Middlesbrough and its Jubilee (1881).

Middlesex, a small county in the south of England, bounded on the N. by Hertfordshire, on the E. by Essex, and on the S. by the Thames and the county of London. The northern boundary is irregular, having been determined originally by the estates of the abbey of St Albans and the bishopric of Ely. On the east the river Lea and on the west the Colne and the Brent form the natural boundaries. Although the area is but 233 sq. m., the population is large (560,012 in 1891), which is accounted for
by the neighbourhood of the county and city of London. We first hear of Middleton as a sub-kingdom dependent on Essex. Its position between the territory of the East Saxons and that of the West Saxons accounts for the name. The greater part of the surface was covered with a forest, of which Epping Chase and Hampstead Heath are relics; but it was traversed by a great road which crossed the Thames, probably by a ford at Westminster, and led north-westward under the name of the Watling Street. The population was very sparse, and it has been remarked that no castle stood within its boundary; and a great abbey except that of Westminster. After the Conquest this part became the 5th county of the county until 1101, when Henry I. granted it in farm to the citizens of London. The position of Middlesex thenceforward until the passing of the Local Government Act of 1833 was wholly peculiar. For a rent of £300 per annum the citizens had the appointment of the sheriff and all other regal rights. It was usual for the sheriffs of the city to hold the office on alternate days, whereas the legal form, "the sheriffs of London and sheriff of Middlesex." The whole body of citizens, excepting the sheriffs and their nominees, were strictly speaking not high but sub-superior, while the Lord Mayor was Lord-lieutenant. Under this régime, as is well known, the county shared in the prosperity of its great neighbour, and its population was so populous that by the act already mentioned the five portions of the county nearest the Thames and the city were severed from it, and, with certain districts of Kent and Surrey, were incorporated into a new "county of London" (q.v.). At the same time a sheriff for Middlesex and a lord-lieutenant were appointed by the crown, and a singular usage which had subsisted for more than seven centuries ceased to obtain.

The geological features of Middlesex are of a simple character. It has no high hills, no great rivers, no picturesque valleys; but the slow rolling undulations consist of what is called London clay, topped here and there with river-dit, in which indications of early human life have been detected, as well as the fossil remains of creatures which are now extinct animals. There is but little tillage, except in the parishes adjoining London, and a great part of the county consists of grazing land, being occupied largely with villæ residences, surrounded in many places with large parks, Brickfields occupy the western border, and the number of parishes in the least villages—without, however, any important town—is remarkable. Brentford, Uxbridge, and Ealing are to the west of London, and the first-named is usually reckoned the county town. Northward are Harrow, with its school, Enfield, and Tottenham. Eastward are Highgate and Hornsey. London, it may be well to note, was never in Middlesex. Middlesex, and especially its eastern border, was the scene of many conflicts with the Danes. During the Wars of the Roses, Barnet on the northern verge gave its name to the battle on the neighbouring Hadleigh Common, where in 1461 the King-maker was defeated and slain. The principal manor houses are Hampton Court (q.v.), Sion House (see Islesworth), and Osterley, near Hounslow, which belongs to Lord Jersey, and is a handsome building by Robert Adam.

Middle Temple. See Inns of Court.

Middleton, a town of Lancashire, on the Irk, 3 miles W. of Oldham and 6 NNE. of Manchester. Dated generally from 1791, when it received a charter for a weekly market, it was incorporated as a municipal borough in 1888. The borough area including the townships of Middleton, Tonge, and Alkington, with parts of Hopwood and Thornham. It is chiefly dependent upon its manufactures of silk and cotton, and has an interesting parish church, a grammar-school (1572), public and technical libraries, &c. Pop. (1881) 18,533; (1891) 21,310.

Middleton, a town of Ireland, 13 miles by rail E. of Cork. At the college (1606) Curran was educated. Pop. 3389.

Middleton, Covyers, a famous controversialist, was born at Richmond in Yorkshire in 1683. He studied at Trinity College, Cambridge, and in 1706 obtained a fellowship, which a prudent marriage soon enabled him to resign. About 1722 he was appointed librarian to the university, and in his later years was presented to the living of Hascombe in Surrey. He died at his seat at Hildesham in Cambridge-shire in 1750. All his life through Middleton was busy in controversy, and in bitterness of tone and ferocity of temper he was a match for any of his contemporaries. His first antagonist was the redoubtable Bentley; but, though at first successful, he was afterwards obliged to apologise to him for libel. His later controversies were theological in character, as his own denomination was that of Nonconformists, but left his own sincerity under grievous suspicion. His Letter from Rome, showing an exact Conformity between Popery and Paganism (1729), was a severe attack on the Catholic ritual, the method employed having been that of much more deadly than dogmatical arguments. He next assailed the orthodox champion Waterland, and startled the devout by giving up literal inspiration and the historical truth of the Old Testament stories. He professed to be giving an unanswerable answer to Tindal and his school of Deists, but it is not certain that he was not himself a freethinker, bent on dealing a secret stab to a religion the tenets of which he ate. In 1747 and the following year he published his famous Introductory Discourse and the Free Inquiry into the miraculous powers claimed to have subsisted in the Christian church after the apostolic age. He attacked the ecclesiastical miracles, pointing out that their true source was in the general intellectual condition of the age that produced them, without needing to postulate either supernatural interference on the one hand or human imposture on the other. It is a little interesting that Gibbon ascribes his boyish conversion to the Roman Catholic faith to the indirect influence of this work, which convinced him not that that church had preserved the gift of miraculous powers, but that this was for the first or four centuries, but that most of its disastrous doctrines were already formulated within that period. Middleton's best-known book remains his well-written and enolgetic Life of Cicero (1741). See Leslie Stephen's English Thought in the Eighteenth Century, chap. iv. part 6.

Middleton, Thomas, dramatist, born about 1570, was the only son of William Middleton, gentleman, who settled in London and married Anne, daughter of William Snow. The earliest mention of Middleton in Henslowe's Diary is under the date 22d May 1602, when he engaged with Mumby, Drayton, Webster, and the others in a new play, Caesar's Fall. First on the list of his printed plays is Blunt, Master Constable (1602), a light, fanciful comedy. Two interesting tracts, Father Hubbard's Tale and The Black Book, exposing the practices of London ronches and sharpers, were published in 1604. The same year was a notable one in The Honest Whore (mainly written by Dekker, but containing occasional scenes by Middleton). The Phoenix and Michaelmas Term (both published 1607) are lively comedies; and even more diverting is A Trick to catch the Old One (1608), The Family of Love (1608) and Your Five Guineas.
n.d. [1658], are of slender merit; but A Mist

Wife, the most successful of which, Aphra

Benthal, a prominent figure of the period,

displayed, performed with singular adroitness.

All these early comedies of Middleton,

even the poorest of them, are dis-

tinguished by smartness and buoyancy. The Roat-

ing Girl (1611), written in conjunction with

Dyce, in which the play is to be published,

noted cut-purse and virago, who is turned into an

attractive heroine by the kindly playwrights.

In 1613, and frequently in later years,

Middleton was employed to write the Lord Mayor's pageant.

The highly amusing but somewhat indelicate comedy,

A Fair Quare (1617), written with

William Rowley, presents in the person of

C aptain Ager a noble example of blusterless

egotism. The Match (1620), to which Rowley contributed,

is an ingenious, well-written masque, contrived with more elaborate

care than was usually bestowed on such compositions.

On 6th September 1629 Middleton was

appointed to the office of City Chronologer. A MS.

City Chronology reveals the Middleton in the 18th century, but has since disappeared. More

Dispensers besides Women (circa 1622, probably

written in conjunction with Rowley), is more elaborate and substantial than the early comedies.

The Trumpet, The Witch, The Mayor of Quin-

borough, and The Old Law are difficult to fix.

The Witch, first printed in 1770, is interesting from the resemblance that it offers in the imitation scenes to

the similar scenes in Macbeth, which (prob.

ably) written earlier. Some of the songs from

Middleton's plays were later incorporated into Macbeth by

the players. The Mayor of Quinborough (first

printed in 1661) was supposed by Dyce to be

one of Middleton's earliest plays; but a passage in iv. 3 is certainly imitated from The Tempest.

The tragic scenes contain some of Middleton's most

powerful work. The Opening scene, the reversal in the Salisburian Court Theatre: and there is more of Rowley in it than of Middleton.

In the three posthumously published plays, The

Changeling, The Spanish Gypsy, and Women-bearer

Women, Middleton's great tragic masterpiece, Rowley had a share in the first two and probably in the third. The Changeling (written circa 1623) has not the sustained tragic power of Webster's

masterpieces, and is weighted with a cumbersome comic subplot (evidently managed by Rowley); but it contains one scene (the collyrie between

De Flores and Beatrice after the murder of Alonso) that for sheer intensity of passion finds no parallel outside Shakespeare's greatest tragedies. It was one of the first plays revived at the Restoration. The Spanish Gypsy (circa 1623), a rich romantic play, is Appenines wisdom, is an example of the tragic issue, but ends cheerful: the breezy Gypsy-scenes are doubtless by Rowley. Women-bearer Women has a lithic beginning, but closes in tragic gloom. As a whole it is even more powerful than The Trumpet.

A very curious, interesting, and skilful play is A Game at Chess, which was acted for nine

years continuously, with unbounded applause, in August

1624. The cause of its great popularity was that it gave expression to the general feeling of satisfaction at the failure of the negotiations for the Spanish marriage. Gondomar ('the Black Knight') was satisifed with scathing severity; and the Arch-

bishop of Spalatro ('the Fat Bishop') was rudely

handled. When the peace with Jonson, Fletcher, and Middleton; but it is difficult to assign any

part to Jonson, and Fletcher's share was slight. The scene in act iv, where Latrocinio disguises himself as an empiric and dispenses his nostrums seems rewritten by Jonson or, at least, revised by some one unknown to Middleton; by whom it was written by him. Anything for a Quiet Life, printed in 1602 and written circa 1619, may have been revised by Shirley.

In 1626 Middleton composed the city pageant,

The Triumphs of Health and Prosperity. On 4th

July 1627 he was buried at Newington Batts.

He had married in 1602 or 1603 Mary, daughter of Edward Morbeck, one of the six clerks in

Chancery; and his son Edward, the only child of the marriage, was born in 1604. The widow survived for about a year. Ben Jonson succeeded to the poetry of the Old Man of the Hill in the hands of Middleton.

Middleton was concerned in the authorship of some of the plays included in the works of Beaumont and Fletcher. Mr. Fleay plausibly assigns to him A Match at Midnight (usually

attributed to Rowley) and the pseudo-Shakes-

peanerian Persian.

Dyce's edition of Middleton's works was published in 1845 (5 vols.); an edition by the present writer appeared in 1885-86 (8 vols.). Selected Plays (2 vols.), with an Introduction by Mr. A. C. Swinburne, are included in the

Mermaid's series, edited by Mr. Havelock Ellis. Jonson, as

is often stated, never lived to write a tragedy. He was, however, a versifier of no mean power, and

his success in the field of comedy was due to

his close study of Shakespeare. He is the

author of a number of plays, some of which are

now included in the canon. One of his most famous plays is The School for Wives, a comedy

of manners set in a country house, where

young ladies are taught how to be charming wives. It was first performed in 1605, and has been

produced many times since then. The play is

characterized by its wit and cleverness, as well as by its satire on the social customs of the time. It is one of Jonson's most successful works, and is still performed today. The play was also translated into French by Lebert in 1606.
at the grammar-school (1872), Cowdray House, 4 mile NE., was built about 1590 by the Earl of Southampton, and for 239 years had been the seat of eight Viscounts Montague, when in 1793 it was reduced by fire to a beautiful ruin. Till 1855 Midhurst bearing (35 sq. m. in area) returned a seat in parliament. Pop. of parish (1851) 1481; (1881) 1615; (1891) 1674.

Midi, Canal du. See GARONNE.

Midianites, an Arab race, descended, according to Scripture, from Midian, the son of Abraham by Keturah. They occupied great part of the country between the Red Sea and the Plains of Moab, and had their headquarters east of what is now the Gulf of Akabah. They were at least partly nomadic, but their caravans brought gold and incense from the south to Palestine, and traded between Egypt and Syria. Some of them lived near Sinai; to them belonged Jethro, priest or sheik of Midian—the father-in-law of Moses. The Midianites were on troublesome neighbours to the Israelites till God's victory over them. Their national god was Baal-Peor. In Midian proper, to the east and south-east of the Gulf of Akabah, the Romans had valuable mines. Sir Richard Burton was convinced that gold was still to be found there, and as an outcome of visits paid in this interest wrote his Gold Mines and Remote Cities of Midian (1878), and Midian Revisited (1879). Later travellers have not confirmed his opinion; but petroleum seems to occur. Midian ceased to be Egyptian and became Turkish again in 1857.

Midlothian. See EDINBURGHSHIRE.

Midnapur, capital of a district in Bengal, on the Kassah River, the Ganges W. of Calcutta by road and canal. There are some manufactures, and an American mission to the Santals. Pop. 33,500.

Midrash, the Hebrew exposition of the Old Testament. See EREDEGIS.

Midshipman, the second rank attained by combatant officers in the royal navy. As a cadet he remains two years in the Britannia, the cadet training school. If he obtains a first-class certificate, he is rated midshipman: on commission, if he only obtains a second-class certificate, he serves six months at sea as a naval cadet and then passes for midshipman; if he only gets a third-class certificate, he cannot pass for midshipman until he has been at sea A year. A midshipman is allowed to serve four years and six months in that rank, inclusive of the time allowed him on leaving the Britannia; then if he is nineteen years of age he can pass his examination as acting sub-lieutenant. He next joins the college at Greenwich, where he receives a nine-months' course in mathematics, navigation, &c., at the end of which time he has to pass his final examination in these subjects to qualify him for the rank of lieutenant. From Greenwich he proceeds to the torpedo school for a three-months' course in mathematics, navigation, science of torpedo, gunnery, and pilotage—he obtains his lieutenant's commission at once as his reward; otherwise he has to wait two or three years, as a rule, as a sub-lieutenant before being promoted. A midshipman's time is principally devoted to his instructions in mathematics, physics, and science of torpedo, gunnery, and pilotage—but his lieutenant's commission at once as his reward; otherwise he has to wait two or three years, as a rule, as a sub-lieutenant before being promoted.
in the majority of cases the necessity of seeking more abundant food-supplies—the *primum mobile* of all roaming—is at the bottom of what seems at first sight a whimsical mode of life. 

Birds are the most marked migrants. The phenomena exhibited by them in this respect have been sufficiently described in Vol. II. p. 172. Various species (the robin and the song thrush, for example) which stay in Great Britain during the winter and move north with the approach of summer. 

Again, all winter there is a drifting over from the mainland to the British shores of species which are not recognised as birds of passage, this shifting of quarters, in a manner akin to migration, cannot be unreservedly determined to be regularly annual, probably due to a lack of food when continental Europe is covered with snow. This reason may also be assigned for those irregular appearances of the wax-wing and the motteacker in the British Isles, and for those sudden arrivals from central Asia in Europe, on to the western limits of Great Britain, of the Pallas sand-grouse, which were the ornithological events of 1859, 1863, and 1888. 

Mammals are less migratory, their movements being restricted by the impossibility of crossing the ocean. The reindeer, however, in many parts of the Arctic circle moves north and south with the approach of summer and south at the approach of winter, and in the Hudson Bay region the Arctic fox—the young more especially—often retreats southward in October, returning northward in spring, though in Greenland, Spitzbergen, and the Arctic regions generally, the animals are not sedentary. The fox shifting its quarters very little, and the reindeer from one valley deeply covered with snow to another in which the lichens and the withered vegetation can be reached more easily. The polar and other seals and cetacea make regular migrations, the latter following the melting ice-fields, while each species of the former reaches the coast at different dates, though their winter haunts are still problematical. But most northern mammals are hibernators when they cannot find sufficient food-supply during winter. The irregular migrants are the most remarkable. Among these the Lemming (*Lemmus lemmus*) is the best known. These animals, at intervals of five, twenty, or even a greater number of years, suddenly start from their home in Northern Scandinavia, in vast droves, by myriads and millions, and steadily pursue a southward course until they meet the sea, when they boldly plunge in and are often drowned in enormous numbers. 

None ever return. The North American gray squirrel (*Sciurus griseus*) will often remain for years in one district, and then suddenly migrate in millions. These two cases—and the lemmings of North America (*M. torquatus*, var. *Andsonian*), exhibit traits similar to their European congener—may, like the corresponding influx of rats and mice in various districts, of the Hesperomys in Brazil, and *Hesperopus* (of which *Pteropus* is the genus) in parts of Australia, be ascribed to the food-supplies in a particular area having suddenly failed or become unequal to the demands upon them; for it is hard to credit the theory that the southward incursions of the lemmings are a result of a food-supply in Scandinavia. 

Migration of Animals. An animal is usually described as 'migrating' when it shifts its quarters at particular periods of the year. 

This, in the northern hemisphere, takes place in spring and autumn, the directions at these seasons being respectively north and south; in the opposite hemisphere the course taken by the migrants is reversed, while in most warm and temperate regions herbivorous mammals, to escape insects and the scourge of winter, retreat to the south, while another large class of animals, the predatory carnivora, ascend in summer to higher altitudes, descending again when the snow covers their grazing ground. Examples are afforded by the deer in North America and Scandinavia, the alpine hares in Scotland, the Ibex in the Alps. In the Southern Hemisphere (*Mignette*) there is every gradation between ordinary sleep and the long-continued dormancy so designated, so it is possible to trace numerous steps connecting the ordinary roaming about of an animal in search of food with the persistent flight or march in one definite direction at a date so determinate that it may be reckoned upon to within a few days. There are, however, in addition, migrations of an irregular character, stimulated by causes still imperfectly understood, though

Thiers signed the famous protest of the journalists on July 25, 1830. After the revolution of 1830 he became Keeper of the Archives at the Foreign Office, but lost this in 1848. In 1833 he went on a confidential mission to Spain, and used the opportunity to explore the famous Simaneas Archives. 

Elected to the Academy of Moral Sciences at its foundation in 1832, he succeeded Counts as its perpetual secretary in 1837, and was elected to fill Romainet's chair among the French in 1836. He died 24th March 1884, within three months of Henri Martin. 

Mignet was the first great specialist in French history who devoted himself to the complete study of particular periods, and in his work he displayed a marvellous mastery of documents.

His works include *Napoleon's relations a la Succession d'Espagne sous Louis XIV.* (1836-42); *Antonio Perez et Philippe II.* (1845); *Vie de Franklin* (1848); *Histoire de Marie Stuart* (1851); *Charles Quint,* *son Abdication,* *son Epitaph* et *son Mort au Monastere de Yuste* (1854); *Essais Historiques* (1843 and 1844); and *Rivital de Francois I. et de Charles V.* (1856). For a great projected history of the Reformation, he is said to have collected a vast amount of valuable correspondence.

See Trefort, *Migne et ses Werke* (Budapest, 1885); the Life by E. Petit (Paris, 1889); and *Jules Simon,* *Mignet, Michelet,* *Henri Martin* (1889).
or were, due to a scarcity of water and naturally of food also. The occasional inroads of bears and wolves on Between these districts are fruit migrations proper, for their boldness is stimulated solely by hunger through the scarcity of food during more than usually severe winters; and to an allied cause may be traced the long excursions of various monkeys (E cantellus and Rhesus) at irregular periods.

Many fishes are regular migrants. The salmon, the shad, some smelts (the North-west American oolecanum, Osmersus pacificus, for example), eels, the sea lamprey, the sturgeon, the river trout, &c., all migrate up river during the spawning season, while the roach and the ide of Scandinavia migrate from lakes into the tributary streams for the purpose of depositing their ova. The herring, sprat, pilchard, and other Clupeidæ move from deep water in spring to shallower places more inshore, by day; and at times settling of the water may hatch the spawn; while other species (e.g. the sudden arrival of the Tenamudon salutaris off the southern coast of Morocco in 1857, and succeeding seasons, after an absence for twenty-seven years) appear and disappear periodically, though the probability most fishes are more or less migratory.

Among reptiles, turtles are the only known migrants, moving on shore at fixed periods to deposit their eggs in the sand, and dispersing their young after departure. Among Invertibrata there are no regular migrants; but many of them perform irregular migrations of considerable interest. The destructive flights of various species of the Locust (q.v.) and Grasshopper (q.v.) in search of green food, the occasional flights of swallow and tern, and the gradual and protracted migrations of the ants are cases in point. In July 1900, near Romershof, in the Riga district, there was witnessed a flight of small beetles. The mass in motion was about 2 miles long, 1½ miles broad, and 7 yards thick. It moved in a north-ward direction, obstructing firemen, and at times settling on the fields. The flights of the various species of locust (especially Paecylus migratorius) are, however, not always impelled by hunger, for though they generally breed in a sandy district when food is too scarce they may yet seek another where it is more plentiful, the reverse course is sometimes taken, as if the species was seeking the barren home of its ancestors. Temperature may also have something to do with locastal migrations, and there is a tendency for the flights to take particular direction. The nearest approach to periodical migration known is the curious movement of butterflies across the Isthmus of Panama and seaward in June and the beginning of July many years in succession. But it is not known where they go, though butterfly showers have been met with in the Pacific several miles from land, and other flights have crossed Ceylon of such an extent that, though miles in breadth, they occupied several continuous days in their passage. It may be taken for granted that all marine animals, like all terrestrial ones, shift about in search of food, when not permanently fixed in their adult condition. Yet, with the exceptions mentioned, it is difficult to point to any which are migrants in the true sense of the term.

A curious inroad of crustaceans—a species of Stenopoma—has been noticed off Cape Verde. At Cape San Antonio, they invaded the houses and the light-tower. Land-crabs are sometimes migratory. The violet species of the West Indies (Gecarcinus ruricola) lives several miles inland, returning to the sea once a year to deposit its spawn. Other species are found at heights of 4500 feet, in the Deccan, though they do not appear to visit the sea, being fresh-water spawners. But in Ascension land-crabs climb up Green Mountains and seek out from their holes, and in Japan the crab Telephusa is found on the tops of mountains several thousand feet high, and in Greece and Italy by streams far inland.

Migration is, therefore, in the vast majority of cases, due to the necessity of seeking new food (1), and (2), as in the case of fishes, crustaceans, reptiles, &c., of finding a suitable place for depositing their eggs. The causes which impel birds to migrate are more complicated, though the two mentioned are the leading ones. With mammals, in all like fashion, the tendency of an origin so remote that it preceded the present distribution of land and water. This is shown by the range of various extinct groups. Thus, true horses of the genus Equus are of older-Pliocene date in Europe, but of Post-Pliocene, or even of later appearance, in America, in the north of the continent, whereas Mammalia, as a whole, seem to have passed into Asia and the Ilamas into South America. We may, indeed, infer with confidence that in the most remote periods of the world's history migration existed; indeed, if we accept (though few palæontologists do) the conclusions of Barrande, they lend support to the belief that, by a date incautiously distant by our methods of measuring time this animal trait was established among the trilobites and other palæozoic invertebrates. It is thus, in some instances, permissible to suggest that the habit is a survival, though it is difficult to point to a case in which it is at present practised without the animal benefiting thereby. For just as hibernation, by enabling an animal to live within its area, serves an important purpose in the struggle for existence, so migration, by enabling the species to escape the revolutions of the globe which would be fatal to it or to its offspring, renders the species more likely to survive longer than it would otherwise be capable of doing.

I, p. 927; Nichollan and Lydekker, Manual of Palæontology (1899); and the geographical Distributional Geography.

MIGUEL, MARIA EVAIR, usurper of the throne of Portugal, was born at Lisbon, 26th October 1862, the third son of King John VI. A dynamic leader of all constitutional principles, he plotted (1824) to overthrow the constitutional form of government granted by his father: he caused the ministers to be arrested and his father to be closely watched in his palace; but the aged king escaped to an English man-of-war anchored in the estuary. Miguel and his mother, his principal abetor, were banished. At the death of John VI. in 1826, the
Miklosich, Franz von, the greatest of Slavonic scholars, was born at Luttenberg in the Slavonian part of Styria, 29th November 1813. After studying law at Graz University, he went in 1838 to Vienna to practice as an advocate, but was led by Kupitar to the study of philology, and in 1844 obtained a post in the Imperial Library. From 1850 to 1885 he was professor of Slavonic at Vienna, in 1851 being elected to the Academy, and knighted in 1859. He died 7th March 1891. His works, nearly thirty in number, include: Schule für die LINGVISTIK der slawischen Sprachen (4 vols. 1862–74), which has done for Slavonic what Grimm and Diez have done for the German and the Romance languages; Die Sprachliche Personennamen (1880); Uber die Mundarten und die Wanderungen der Zigeuner Europas (12 parts, 1872–80); Rumanische Untersuchungen (1882); and Etymologisches Worterbuch der slawischen Sprachen (1886).

Milan Cathedral.

Milan, the third in size of Italian cities, Naples ranked first and Rome second, stands in the great plain of Lombardy, 80 miles S.E. of Turin, 155 W. of Venice, and 25 S. of Lake Como at the foot of the Alps. The city, nearly circular in shape, is surrounded on three sides by walls, has a circuit of nearly 8 miles, and is entered by 14 gates. Although a mere 1000 years and a scant antiquity, it does not possess many very old buildings; it has been too greatly ravaged by war. The modern city is a busy, enterprising, and wealthy community. The streets are broad and regular, and the houses substantial and roomy. The principal church is the cathedral of the archbishop, the foundation of which was laid, on a site where already two cathedrals had stood, by Gian Galeazzo Visconti in 1386; it was completed by order of Napoleon I. in 1805–13. It is built entirely of marble, and in the exterior is adorned with some 6000 statues in niches and a vast number of pinnacles. Other noticeable churches are St Ambrose, founded in 868, on the site of one dedicated by the saint himself in 387—it has early mosaics, an altar with clever goldsmith’s work, and other antiquities; St Eustorgius, dedicated in 320, with interesting sepulchral monuments; St George, founded in 750, but greatly modernised, with pictures by Luini and Ferrari; St Maria delle Grazie (built 1468), on the walls of whose refectory is Leonardo da Vinci’s ‘Last Supper,’ and St Maurice the Greater (1497–1506), adorned with paintings by Luini and his school. The principal secular building is the Brera Palace (12th century), formerly a Jesuit college, now the palace of arts and sciences, which shelter within its precincts a very valuable gallery of paintings by such masters as Raphael, Da Vinci, Luini, Mantegna, the Bellinis, Titian, Van Dyck, &c., an academy of art, a collection of casts for modelling, the magnificent monument of Garzoni de Foix, the national library (1770) of 162,000 vols., and 3650 MSS., an archaeological museum, and an observatory. In Frederick Borromeo’s creation, the famous Ambrosian Library (1609), there are 164,000 vols. and 8100 MSS., besides collections of drawings, engravings, and pictures. The city is adorned with numerous palaces, as that of the archbishop (1570); the royal palace, with fine modern frescoes; the Late Renaissance municipal palace (1558); the former castle of the Visconti (15th century), with frescoes by Luini; the Poldi-Pezzoli palace, with a collection of paintings of Leonardo da Vinci’s school, armour, and artistic objects; and several others. The arched colonnade of Victor Emmanuel (1863–67), lined with fine shops, forms a favourite promenade of the people. The Arch of Peace, built of white marble (1807–38), commemorates the exploits of Napoleon. The Della Scala opera-house (1778) is the second largest (next after San Carlo at Naples) in Italy. Mascare, Manzoni, the popes Pius IV. and Gregory XIV. were natives of Milan. The principal of the scientific and artistic institutions
are an academy, a higher technical institute, several scientific societies, a museum of natural history, schools of veterinary practice, music, and art and the Sforza Castle. Important scientific institutions are numerous and splendidly endowed, having an aggregate property of £7,000,000 sterling; the Great Hospital (founded in 1448) can accommodate 2500 patients. Owing to its central situation in the upper valley of the Po, to the north of the meeting place of the north Italian railways and canals, and owing to its proximity to the Alpine passes, Milan has always been a place of much commerce. It now carries on a vast trade, much increased since the opening of the Gothard railway, in raw silk, cotton, grains, rice, and cheese, and manufactures silks, velvets, gold, silver, and iron wares, railway carriages, tobacco, porcelain, electric-light apparatus, and is an active centre of the printing-trade. Milan is the chief financial and banking city of North Italy. Pop. (1891) 283,238; (1881) 265,543. This is the pop. of the city (214,084 in 1881) and the suburbs; the commune had (1881) 321,589 inhabitants; (1890) 360,000.

Milan (Lat. Mediolanum) was originally a town of the Insular Gauls. It was conquered by the Romans in 39 B.C. and under the Empire became a sumptuous centre of wealth and civic influence; its citizens were noted for their refined manners and literary tastes, and the public buildings for their beauty and elegance. In the beginning of the 4th century it was selected as the residence of the imperial court, and was sacked by the Huns (under Attila) in 452, by the Goths in 539, and passed to the Longobards (568), and to the Franks previous to its subjection by the German empire. Here several of the German emperors were crowned with the Iron Crown, and in the public library of Milan, in the 13th century, the head of the Lombard League of towns that opposed Frederick I., who twice besieged it, and once razed it to the ground. Nevertheless it continued to prosper, notwithstanding that it was distracted by the intestine feuds of the Genoese and Genoese Ligurians. The Supreme power became eventually (from 1277) vested in the Ghibelline Visconti, who extended the ascendancy of Milan over the whole of Lombardy, and in 1365 bought from the emperor the title of duke. The successors of the Visconti in the lordship of Milan were: Filippo Maria Visconti (1341-1383); Gian Galeazzo Visconti (1383-1402); 1413 Milan submitted to the predominance of Spain, and from Spain passed to Austria. Under Bonaparte it was declared the capital of the Cisalpine Republic, of the Italian Republic, and, finally, of the Kingdom of Italy. In 1815 Milan was restored to Austria, and continued the capital of the Austrian-Italian kingdom until the annexation of Lombardy to Piedmont in 1859 by the peace of Villafranca. The 1848 troubles in Italy originated in a revolt of the Milanese against the tyranny of the Austrians. The province has an area of 1213 sq. m. and pop. (1881) of 1,114,991; and (1889) 1,228,218. See Histories by Rosmini (4 vols. 1820), Cantù (2 vols. 1845), and Cusani (7 vols. 1862-67).

Milazzo (anc. Mylae), a fortified seaport of Sicily, on a promontory 21 miles W. of Messina. Off Mylae in 200 B.C. the Romans won a great sea-fight over the Carthaginians; and here on 20th July, 200 B.C. the Great General Scipio Asellus defeated 7000 Neapolitans, and compelled the garrison to evacuate the fortress. Pop. 7071.

Mildew (A.S. Meldew, 'honey-dew'), a general name applied to numerous diseases of plants caused by or associated with the parasitism of certain fungi. The name is obviously most appropriate in reference to those fungi which form white mealy patches on the plants. Some of the most important are species of Erysiphe, and are common both on leaves and green stems of many Dicotyledons and a few Monocotyledons. The filaments of the fungus branch and spread over the epidermis of the plant, sending suckers everywhere and there into the cells. They multiply by the asexual formation of spores, and in most cases also from sexually produced fructifications. Among the common forms may be noted: Erysiphe laeverscens on Composite, Plantago, Verbascum, Labiates; E. graminis on grasses; E. niortii on Umbellifers and Leguminosse; E. communis on Polygonum, Rumex, Tussilago, Ranunculus, &c.; E. (or Oidium) tuckeri on the vine; and a species of E. on the buckeye, and other trees, is a troublesome pest. These are all nearly related, but the mildew or rust of corn (Puccinia graminis or Acidia rum berberidis), whose life is divided between barberry and cereal, belongs to a distinct series. See FUNGI.

Mile, a terrestrial measure of length, is derived from the Roman milelire, which contained 1000 passus (mille passus) of 5 Roman feet each, the pace being the length of the step made by one foot. The Roman foot being between 11·65 and 11·62 English inches, the Roman mile was thus less than the present English mile by from 142 to 144 yards. The length of the modern mile in different countries exhibits a remarkable want of exactness, and is not satisfactorily accounted for. Before the time of Elizabeth, scientific writers made use of a mile of 5000 English feet, from the notion that this was the Roman mile, forgetting the difference in value between the English and Roman foot. The present statute mile was in fact originally defined by an act passed in the thirty-fifth year of the reign of Elizabeth to be '8 furlongs of 40 perches of common land each'—i.e. 1700 yards of 3 feet each—and it has since retained this value. The geographical or nautical mile, also called or known as the sixth part of a degree of the equator (=1·51 English statute mile), and is employed by the mariners of all nations; but in Germany the geographical mile denotes 2/3 part of a degree in the equator, or 4 nautical miles.

Miles, Nelson A., a distinguished American soldier, was born in Westminster, Mass., August 8, 1839, entered the army as a private in the Civil War broke out in 1861, rose gradually, and was mustered out of the volunteer service, a major-general, in 1866. In the same year he became colonel in the regular army, and in 1867 he was brevetted brigadier-general and major-general. He was next successively (1874-90) against the Indians. He was promoted brigadier-general in 1880, major-general in 1890, and was put in command of the army in 1895. In 1900 he received the newly-revived rank of lieutenant-general.

Mileians, another name for the Scots, the last of the prehistoric invaders of Ireland (q.v., Vol. VI. p. 293); from an assumed eponymous ancestor Mileius, whose name is a modification of Miles, a Latin translation of the Celtic Gulam.

Miletus, anciently the most flourishing city of Ionia, in Asia Minor, situated near the mouth of the Maeander; was famous for its woollen cloth and carpets, and its furniture, and for its extensive trade. Before being forcibly colonised by the Ionians (q.v.) under Neleus, it appears to have been inhabited by Carians or by Leleges, its people early founded nearly four hundred of the Black Sea colonies, and in the 4th century the Abydians, Lampacians, Cyzygians, Sinope, Ananis, Olbia, Panticaeum, &c.—sent merchant fleets to every part of the Mediterranean, and even into the Atlantic, and maintained an obstinate war with the early Lydian kings, until Croesus was at length acknowledged as their master. They were believed to be the purest representatives of the Ionians in Asia.
After the conquest of Lydia by the elder Cyrus, Milftol submitted to Persia; but in 500 B.C. it was seized by the Medes, who plundered it, massacred most of its inhabitants, and banished the survivors to the mouth of the Tigris. Afterwards the city was rebuilt, but never reacquired its former importance, although its people resisted the attempt of the Athenians to compel their allegiance, and dared to resist Alexander till he stormed the city. It kept the rank of a second-rate commercial town down to the time of Pliny, and was finally ruined by the Turks. Miltoft was the birthplace of the philosophers Thales, Anaximander, and Anaximenes, and of the historians Cslinus and Heironnus. Short tales, mostly in dialogue, and of a witty and obscene character, were greatly in vogue amongst the Greeks under the name of "Miltoftian tales."

Milfoil, a name applied to several kinds of plants as the Common Milfoil (Achillea millefolium), the Hoodeed Milfoil (Ceratostigma), but not the Water Milfoil (Myriophyllum). The first-name is invariably understood by the term when it is used without any qualifying adjective. The plant belongs to the natural order Compositae. It is one of the commonest of British plants, and is very abundant in certain counties, as Yorkshire. It ranges from the Mediterranean to the Arctic Circle, and extends over a great part of North America. The plant is medicinal, being mildly aromatic, tonic, and stimulant; and yields tannin, a bitter extractive, a volatile oil, and an acid called achillaic acid. In Sweden the plant is employed as a substitute for hops in the making of beer.

Milford, a parliamentary borough (contributory to Pembroke) and seaport of South Wales, in the county of Pembroke, is pleasantly situated on the north side of Milford Haven, about 7 miles ENE. of St Ann's Head, and (by rail) 371 miles W. of London. The town itself, which, with 500 acres of adjoining land, has been acquired by a company as lessee for 999 years, presents no features of interest; the Haven, which as a natural harbour is unequalled both in area, complete shelter, and facility of entrance, being by far the greater attraction. A low-lying sandy land, it varies in breadth from 1 to nearly 2 miles, and has a depth in most places of from 16 to 19 fathoms— even at low-water-spring-tides there being a minimum depth of 8 fathoms—whilst commanding all its approaches over several bays, all armed with heavy guns, thus securing Pembroke as well as Milford from any seaward attacks. In 1485 the Earl of Richmond (afterwards Henry VII.) disembarked here from Brittany shortly before the battle of Bosworth. Docks designed by Sir E. J. Reed and capable of accommodating vessels of the largest size, were completed in 1882, but not opened to shipping until 21st September 1888; their total area is 60 acres, and the depth of water inside 24 feet. Despite their construction, however, the trade of the port has as yet, apart from the lines of passenger and outward service with the Irish ports of Cork and Waterford, made but little progress; but a proposal to run a fast line of steamers between Milford and Labrador has met with considerable success. Pop. 3334.

Milford, a town of Massachusetts, 36 miles W. by S. of Boston, with boat-factories. Pop. 11,376.

Military Frontier. See CROATIA.

Military Law. See MARTIAL LAW, COURT-MARTIAL, AND MUTINY.

Military Orders, religious associations whose members united in themselves the double characters of monk and knight. These orders arose about the period of the Crusades, the first to be formed being the Hospitallers (q.v.). Their primary duties were to tend sick pilgrims at Jerusalem, afterwards to protect the inroad of Saracen to those holy places. The order of the Templars (q.v.) soon followed; their purpose was to protect pilgrims, a duty to which they were added that of guarding the Temple at Jerusalem. The orders of Alemona, of Calatrava, and of Santiago of the Sword, in Spain, had for their immediate object the defence of their country and creed against the Moors. These orders, as well as that of St Benedict of Aviz in Portugal, which was instituted with a similar view, differed from the Templars and the Knights of St John (Hospitallers) in that their members were permitted to marry. The same privilege was enjoyed in the Savoyard order of Knights of St Maurice, and the Bavarian order of St Hubert. On the contrary, the Teutonic Knights (q.v.), who had their origin in the Crusades, but afterwards made the south-east and east shores of the Baltic the theatre of their activity, were bound by an absolute vow of chastity. These religious associations have mostly been abolished or have fallen into disuse, though some still subsist as orders of knighthood. See Berteneuf, Gesch. der geistl. Orden (1842), and Lawrence Archer, The Orders of Chivalry (1861).

Military Schools in connection with the British army are of three classes. First, the Royal Military Asylum (Duke of York's School) at Chelsea, and the Royal Hibernian Military School, Dublin, where the sons of soldiers who have died in the service receive a preparatory education free of charge, and may or may not afterwards enter the army. The commandants of these establishments are officers of the army, but the masters are civilians. Secondly, the Royal Military Academy, Woolwich, the Royal Military College, Sandhurst, and the Army Medical School at Netley, where gentlemen qualify for commissions by undergoing special instruction. Thirdly, those establishments where officers, non-commissioned officers, or men, already in the service, receive technical instruction in various branches of military art—viz., the Staff College at Camberley; the College of Artillery at Shoeburyness (the Artillery College), the School of Military Engineering at Chatham, the School of Musketry at Hythe, the School of Gymnastic Instruction, the Schools of Signalling and of Range-finding, the Army Veterinary School, and the School for Military Catering; a similar school for other auxiliary forces at Wellington Barracks, London; and the Royal Military School of Music at Kneller Hall, IxowsloM. All are under officers of the army, and, with very few exceptions, the staff of instructors are also officers or sergeants. Those under instruction join the schools for periods varying from a month to two years, and then rejoin their regiments. The following is a description of the more important of these establishments: the Royal Military Academy, Woolwich, and its subsidiary, the Royal Military College.

The Royal Military College at Sandhurst, in Berkshire, 5 miles SSE. of Wokingham, and 33 WSW. of London, was established in 1838 by a remodelling of the Junior Department of the Royal Military College (transferred thither from the Military College at Woolwich, 1812). Its object is to give military education to youths destined to receive commissions in the British army. The age of admission was between sixteen and nineteen. On production of satisfactory certificates and references, a youth's name was permitted by the commandant to be put on the list of candidates for the entrance examination. These examinations were held half-yearly, and the list of subjects included English composition, modern
MILITARY SCHOOLS

languages, mathematics, history, geography, natural and experimental sciences, and drawing. The examination was competitive, and those who had the most marks were admitted as cadets as soon as vacancies occurred in the college. The course of study lasted two years, and included a variety of subjects connected with military science. The friends supplied clothing, books, and instruments, and paid annually for education, board, and lodging from $20 to $100. The highest sum was devoted for private instruction, while the lowest for 'the sons of officers of the army or navy, who had died in the service, and whose families were proved to be left in pecuniary distress. Twenty were 'Queen's cadets,' sons of officers who had fallen in action, or had died from the effects of active service, and had left their families in reduced circumstances.' These were admitted on passing a qualifying examination, and educated gratuitously. In 1870 a different system was tried, but the results not being satisfactory, it was very quickly condemned and the old system reverted to. The length of the course of study has never been reduced to one year, and the cadets have much more freedom than formerly, when they were treated in all respects like soldiers in barracks.

See CADET.

In addition to the Royal Military College, Sandhurst, is obtained by open competition at examinations held each half-year under the direction of the Civil Service Commission. Candidates must first have passed the same 'preliminary' examination as for the Royal Military Academy, Woolwich, or have been received as equivalent to it, and the medical examination. They must be between the ages of seventeen and twenty, unless graduates of the universities, when they may be as old as twenty-two. The number of trials is three for ordinary candidates, but only two for university graduates. The 'further' examination includes mathematics, classics, modern languages, English history and composition, experimental sciences, geology, and drawing—divided into twelve subjects, of which seven may be taken. Successful candidates for the Royal Military College are required for one year, and, unless subject to passing the half-yearly examinations in fortification, tactics, military administration, law, and topography, and becoming proficient in drills and exercise (including riding, gymnastics, and musketry), are not appointed as second lieutenants in the cavalry or infantry. They are liable, however, to removal for grave misconduct or incapacity.

At the Army Medical School, Netley, Southampton, medical candidates already professionally qualified are further instructed in pathology, military surgery, medicine, and hygiene. All invalid soldiers from abroad are sent to the hospital at Netley, to which the Army Medical School is contiguous. After passing the prescribed course and examinations, the candidates are commissioned as surgeons in the medical staff of the army.

Entrance to the Staff College, at Camberley, near Sandhurst, is obtained by competitive examination. The first twenty-eight officers who qualify at the annual examination are admitted, with certain limitations. Candidates must qualify in the examination, held every summer, in simple mathematics, one modern language, fortification, military topography, and tactics. A service of at least five years is also required, and candidates must not exceed thirty years of age, be competent or have passed the qualifying examination for that rank, and have been selected by their commanding officers as fit for the staff in physical qualifications, military knowledge, conduct, habits, and temper. The college course commences in February of each year, and includes the study of modern languages, military history and geography, fortification and artillery, tactics, staff duties, military administration, topography, and law. There is an examination at the end of each year, and officers must also pass in military efficiency; if two ful, they leave the college at the end of the second year, and, after being attached for a month to each of those branches of the service with which they have not hitherto served, rejoin their regiments until opportunities occur for appointing them to the staff.

At the School of Gunnery, Shoeburyness, officers and men of the Royal Artillery are put through a course of gunnery and artillery exercises, and experiments with new guns, shells, fuses, armaments, &c, are carried out in connection with the ordnance committee; while at the Artillery College, Woolwich, officers are instructed in the manufacture of ordnance, laboratory work, chemistry, metallurgy, electricity, &c.

The School of Military Engineering, Chatham, is for the instruction of engineer officers and men in construction and estimating, practical fortification, surveying, submarine and military mining, bridging, balloonning, electricity, chemistry, photography, &c. Young officers on appointment from the Royal Military Academy remain under instruction for two years. For officers of other branches of the service there are classes for instruction in 'field-works' and surveying; for cavalry soldiers, a 'cavalry-pioneers' course (hasty demolitions, obstructions, &c), and staff officers studying for commissions.

The School of Musketry at Hythe (q.v.) is for the other arms what the School of Gunnery is for the artillery. For the Royal Military School of Music, Kneller Hall, see BAND.

At the School of Gymnastic Instruction, Aldershot, officers qualify for the appointment of superintendents of gymnasia, and non-commissioned officers or men for that of gymnastic-instructor. The course includes fencing with foil, sword, or bayonet. Recruits are put through a three-months' course of gymnastics here and in every garrison where there is a gymnasium.

Army Schools (q.v.) are provided for the general education of soldiers and their children; and 'garrison classes' under specially qualified staff-officers, generally graduates of the Staff College, for the technical education of soldiers studying for the rank of lieutenants in the cavalry or infantry. They are liable, however, to removal for grave misconduct or incapacity.

For the United States Military Academy, see WEST POINT. Other military schools in the United States include the Virginia Military Institute at Lexington (founded in 1839), the Kentucky Military Institute (1846) at Farmdale, and the school for subalterns of artillery at Fortress Monroe, in Virginia, for infantry and cavalry officers at Fort Leavenworth, Kansas, and for engineers at Willet's Point, Moreover, there are forty commissioned officers detailed to act as professors of military science and tactics at certain colleges which have received from the United States grants of land,—In Canada there is a Royal Military College at Kingston (1876).

Militello, a town of Sicily, 21 miles SW. of Catania. Pop. 10,565.

Militia (Lat. miles, 'a soldier') is the name sometimes given to the troops of the second line of a national army. A national soldier, after serving in the active army and its reserve, passes into the militia available as garrison troops or to form a field army. The corresponding troops in Germany and Austria are called landwehr and landsturm, and in France the territorial army.
Though at first intended for home defence only, these troops are freely used to reinforce the regular army if the exigencies of the circumstances require it. In several respects the militia of Great Britain differs from that of other European nations. It can only be sent out of the country if it volunteers and with the consent of parliament, and with a few individual exceptions the men composing it have no right to serve in the regular army.

It is a constitutional force raised under the sanction of parliament for the defence of the country against invasion. Organised by counties and cities, it is essentially a local force. Under the Anglo-Saxons all men were required to bear arms as a sort of body-guard for the land they held, but there was no special organisation until Alfred's reign. That great king organised the militia or fyrd, making land the basis of numbers, but the family system that of discipline; so many families were a tything, ten tythings a hundred, and hundreds were united into county powers, each under its heretoga, dux, or duke. Each section of the community had not only to furnish its quota in time of war, but also to provide arms, keep them in repair, and train its men for military duty. Every year they must subsist in more or less vigour until the Conquest; then the feudal troops rendered the militia unnecessary; but it never ceased wholly to exist, and when the crown began to contend with the Norman barons it naturally found its most powerful instrument in the militia. It was a system by which 'an assize of arms,' at which every holder of land was bound to produce one or more men fully equipped, and capable of fighting in the national defence. This annual assembly of the fyrd or militia is first recorded after the Conquest in 1181. Further alterations as of the army of the Norman king at war took place in 1558. In 1604 James I. abolished the fyrd, and substituted 'Trained (commonly called Train) Bands,' to the number of 160,000 men—a force partaking of the nature of both the militia and volunteers, but deficient in discipline and drill. During the Civil War the bands were in some part used with the Parliament. Up to that time the command had never by any law been definitely assigned to the crown, but after the Restoration the Royal charter of Charles II, declared 'the sole supreme and undisputed authority in the establishment of the militia to be the undoubted right of his majesty and his royal predecessors.' As, however, the crown from this time began to depend for its support upon a mercenary army, the militia was much neglected until 1757, when, a large portion of the regular army being absent in the Seven Years' War, it was carefully organised for the defence of the kingdom. Several militia acts have been subsequently passed. In 1871 the control of the militia was transferred to the War Office from the lords-lieutenant, who may, however, still recommend gentlemen for commissions. Various laws for the consolidation of the national defences by bringing the army, militia, and other military forces into closer connection were completed in 1876, and the United Kingdom was divided into 69 infantry regimental districts, each of which contains a territorial regiment, consisting generally of two line battalions, and two or more militia battalions, besides the regimental depot, volunteer battalions, and the men in the Army Reserve and Militia Reserve. The latter are militiamen who by taking a double bounty (£3) at the end of each training rendered themselves liable in time of emergency to be drafted into the regular army. The Militia Reserve numbers about 30,000.

The number of militiamen to be provided by each territorial district—known as its quota—is fixed by government in proportion to the number of battalions in each such district. These numbers are enhanced by county recruitment, so that six counties may re-enlist for six more; but should volunteering fail, a levy by ballot would be made upon all the inhabitants of the locality between the ages of eighteen and thirty to serve five years. The power of making this ballot always exists, and would have by law to be enforced, but for the annual Militia and Ballot Suspension Act. Many classes are exempt from the ballot, as peers, soldiers, volunteers, yeomanry, resident members of universities, clergymen, parish schoolmasters, articled clerks, apprentices, seafaring men, crown employees, free watermen of London. The pay of the militiaman is more poor with more than one child born in wedlock; in Scotland any man with more than two lawful children and not possessed of property to the value of £50; in Ireland any poor man not worth £10, or who does not pay 5s. per annum for rent, and has more than three lawful children under the age of fourteen.

Large barracks have been built at the head quarters of regimental districts where there were none previously, so that militia when training need no longer be billeted. Camps are constantly formed for their occupation. The officers are often employed with the ranks in passive service of the army, and in 1815 the militia recruits are if possible trained at the headquarters of the regimental district, and everything possible done to increase the efficiency of the force and assimilate it to the regular army. Young officers, after serving two trainings in the militia under the same training, are posted to regular service, and the militia forces are to be organised in analogous military topography, and law, as well as a literary examination similar to that for cadetships at the Royal Military College (see Military Schools), are given commissions in the line and cavalry, or, if they pass the entrance examination for the Royal Military Academy, recommended for admission. Finally, in 1890 it was decided that the militia should no longer be styled part of the 'auxiliary' forces of the empire.

The militia assembles annually for not more than fifty-six days' training (recruits for not more than six months), and the government can embody the whole or part of the force at any national crisis. In November 1813 a brigade of three militia battalions was formed, and embarked for France in March 1814, serving in the Marquis of Dalhousie's division till the peace. By 1815 the militia had been embodied for nearly twenty years; again, during the Russian war of 1854-56 several battalions served in garrison at Gibraltar and Malta; and many were embodied during the Indian Mutiny, 1857-59. The quota of the United Kingdom (including the Channel Islands) is 143,450 men, of which number 121,000 may be considered as effective, costing the country about 14 millions.

A militiaman receives a bounty of £1 (£1 10s. if re-enlisted) after each training. When out for training or embodied, the officers and men receive the same pay as regular troops of corresponding arms of the service, and are then all under the Army Act of 1851. The officers rank with, but junior to, those of the regular army, and are at all times subject to military law. The only distinction in uniform is the letter M on the shoulder-straps.

The celebrated Local Militia is the old general levy; it was instituted in 1608, and suspended but not abolished in 1810. It consisted of a force for each county six times as numerous as the regular militia quota. The men were drawn by ballot from those between the ages of eighteen and thirty, served four years, and were not paid bounties or allowed to find substitutes. The counties were liable to a fine of £15 for every man short of the quota. These troops could only be marched beyond their respective counties in the event of actual invasion, but
MILK

were liable to be called out in case of rebellion. Their numbers reached in 1811 to 21,000 men.
The militia of Scotland was not organised until 1797, though before that year corps of fencibles had been embodied. It was to be raised by ballot among men between the ages of nineteen and thirty. In 1802 it was brought under the same rules as the English militia. The Irish militia dates from 1715, when all counties were required to train one army of volunteers, or find substitutes. Several subsequent acts of parliament altered the conditions of service, introduced the ballot, &c., and finally in 1809 it was organised in a similar manner to the English force. Besides the infantry and artillery militia there are in England four militia corps: the larger corps are in Monmouthshire, and three in Anglesey; also six divisions of submarine miners (dating from about 1884) at Portsmouth, Plymouth, Chatham, Harwich, Milford Haven, and the Severn month.

The Channel Islands Militia, dating from 1291, consists of four corps of garrison artillery and six battalions of infantry (in all about 4000 men), and is recruited by conscription. All youths between the ages of sixteen and eighteen are liable to drill preparatory to being enrolled in the ranks of a regiment. At the age of seventeen they are trained in the art of arms, and then passes into the reserve, in which he remains up to the age of sixty years. A sum of £5570 is voted by parliament in aid of this force.

In Canada there are artillery and infantry militia for home defence, and similar troops in all important British colonies. The Militia Act of Nova Scotia declares the militia to be the home defence of the country, and so long as the militia is not declared to be in a state of war it is the duty of the governor and governor-general to provide for the efficiency of the militia, and for the maintenance of the peace of the province.

Milk is a pale yellow fluid secreted by the mammary glands of the females of the class Mammalia, after they have brought forth their young, and during the period in which their offspring are too immature to live upon ordinary food. It is devoid of odour, except for a short time after its extraction; it is of a slightly sweet taste, most commonly of a slightly alkaline reaction (except in the Carnivora, in which it is acid); and its average specific gravity (in the case of human milk) is 1.032. When examined under the microscope milk is found to contain countless transparent globules, of very minute size, floating in a clear colourless fluid, the milk plasma. These globules are composed of fat, and they are each enclosed by a thin envelope of an albuminous material termed casein. When milk has stood for some time, the larger globules rise to the surface and form a layer of cream, which is therefore rich in fat and poor in other nutritive substances (presently to be described) that are found in the milk plasma. When the cream is removed skimmed milk remains. If this, or better still unskimmed milk, be agitated in a churn, the envelopes which surround the fat globules are broken, the fat runs together, and we have milk fat or butter. The albuminous casein, which according to some encloses the fat globules, but according to others is present in the plasma, is an albuminous substance combined with calcium phosphate. This calcium phosphate is necessary for its solution, and if its union with the albumen be interfered with, as by the addition of an acid, the casein separates out in microscopic filaments, which interfere with the digestion of the milk globules, and forming a more or less solid clot. If milk be allowed to remain in an open vessel and in warm weather, a few hours will produce this result; the casein clots in little masses, and we say 'the milk has turned.' It is acid or sour to the taste, and contains micro-organisms (bacterium lactis),

by whose agency these changes are brought about. These little microbes have the power of converting the milk sugar into lactic acid, which in its turn coagulates the casein. These microbes do not exist in milk freshly passed from the mammary glands; they must find their way into the milk, where they rapidly multiply; and, as their gerns are very freely distributed, this occurs sooner or later. The dairyman therefore keeps, by the simple process of allowing the casein to coagulate, and the care

ful nurse seals out the infant's bottle in order that they may not multiply, as they will readily do, in any stale milk, rapidly infecting the fresh milk each time the bottle is used. The casein is finally not only clotted by acids, but a secretion of the stomach, called rennet, has a similar action. A teaspoonful of a commercial infusion of rennet will cause half a pint of milk, at a summer temperature, to form a beautiful white clot, which subsequently contracts, expressing the whey, when the heat occurs upon the acid when we drink milk, and this is one reason why milk may disagree: in order to render it more digestible it may be sipped, or it may be taken with lime-water, for in this way the formation of the casein is stopped.

The curds which form after the addition of rennet can be made into cheese. In cheese, therefore, we have a rich supply of nitrogenous matter (casein) together with fatty matter derived from the milk globules held fast in the curd.

Milk contains sugar—in solution, and in addition a rather large proportion of inorganic salts. It contains all that a child requires for the growth and nourishment of its body, and is manufactured at great expenditure of the mother's strength. The first milk that flows from the breast contains the largest amount of lactose, and is rich in fat but poor in casein. After a few days, during which time the child feeds chiefly on its own tissues and losts weight, the secretion becomes thoroughly established. In a healthy, well-fed woman this continues for some months, after which time the secretions occur upon the energy of the mother's body renders the milk poorer and less nutritious. The milk contains the salts, chiefly of lime, from which the infant builds its skeleton. Where the children are ill nourished and rickety, the lactose content of the milk is diminished, and the milk is liable to be contaminated with lime-water, ignorant of the fact that milk contains a considerably larger quantity of lime than the lime-water itself. The lime-water diminishes acidity, and renders the milk digestible, but hardly adds lime; receipts are generally due not to lack of lime-salts in the food, but to want in the child's system of the power to assimilate them. It is well known that many medicines taken by the mother are excreted in the milk, and this point must be borne in mind by mothers suckling their infants; much nonsense is, however, believed in regarding the fatal and sudden injury done to children a result of severe mental excitement on the part of the wet-nurse. Owing to inability of the mother either to nourish her offspring herself or to provide herself with a wet-nurse, it may be necessary to bring it up on the breast of an animal; see INFANT (FEEDING OF), BREASTS.

The following table, which is based on researches of Verwois and Becquerel, show the density and composition of 1000 parts of milk:

It is preferable to use the milk of one animal and not the mixed milk of a dairy, as in that way we minimise the chances of infection. It should be diluted with about one-third of water, and perhaps a pinch of sugar added. It then forms a good substitute for the mother's milk. But disease is very frequently transmitted by milk, not only from using contaminated water for washing the milk cans and for adulterating it, but also from the cow itself (see Typhoid Fever, Scarletina). It is not improbable that many obscure tubercular conditions are thus acquired by children.

The animal is generally prepared from that of the cow, sweetened by the addition of ordinary cane sugar, and evaporated to about 4th of its bulk. While hot it is poured into tins and sealed up. When used for food the milk may be diluted with six or seven times its volume of water, but in the case of infants the dilution must be more liberal. During the first month it may be diluted with twelve or fourteen volumes, and later on with ten volumes of water. It is often found to agree with children better than cow's milk, but it is very fatal to reconstitute an infant on condensed milk entirely, as the diet will suffer from too great uniformity. It is a safe rule when a child has to be brought up on animal milk, and when the household milk does not agree, to change the dairy. If this does not succeed, the ordinary cow's milk may be slightly heated or for morning feeding, with condensed milk at night. In all cases it is better to err in freely diluting milk, for nothing is so apt to disagree with a child as a surfeit of rich milk; dilution will do no particular harm.

Milk is frequently adulterated, chiefly with water (see Distillation). In this case a given volume of milk will contain an abnormally small number of milk globules. As these milk globules are the cause of the opaqueness of milk, a thin layer of the adulterated milk will be less opaque than a similar layer of unadulterated milk. Many forms of lecrosecope have been invented for testing the opaqueness and consequent dilution of milk (see Lactometer). Unskimmed milk should yield in standing 12 to 24 parts per cent. of cream, and its specific gravity should be 1.023 to 1.034. Skimmed milk is heavier—1.022 to 1.018 (see also Dairy). Milk-leaf is a local name for the genus Asclepias; for Milk-tree, see Cow-Tree.

**Milk-fever.** The establishment of the secretion of milk about two days after delivery is occasionally the cause of considerable constitutional disturbance, with all the symptoms of the feverish state, including the infusion of the alimentary canal and of the skin, and not applied soon enough to the breast, and especially when the mother is kept on too low a diet; a fact which probably explains the much greater frequency of the condition in former times, when such treatment was considered necessary. The affection is not serious, and passes off when the breasts are emptied.

In the lower animals, also, milk-fever comes on within a few days after parturition. One variety, common to most animals, consists in inflammation of the membranes of the womb and bowels, and is produced by exposure to cold, overdriving, or injury during labour; it is best treated with oil and laudanum, tincture of aconite, fomentations to the belly, and antiseptics such as carbolic acid (largely diluted) injected into the womb itself. The other variety is a species of the term 'milk-fever' should be applied, is almost pathetic. It attacks animals in high condition, that are good milkers, and have already borne several calves, and consists in congestion of the brain and large nervous centres, and impairs all the vital functions, leading to dullness, loss of sensation, inanition, and complete unconsciousness. Blood must be drawn early, whilst the cow is still standing and sensible; later it only hastens death. A large dose of physic, such as a pound each of salts and tincture, a drachm of calomel, an ounce of gamboge, and two ounces of ginger, should be at once given, solid food withheld for a little while, and the amount of secretion being kept up every hour, cloths wrung out of hot water applied along the spine, the teats drawn several times daily, and the animal frequently turned. Although treatment is uncertain, prevention may be ensured by milking the cow regularly for ten days before calving, feeding sparingly on laxative, unstimulating food, giving several doses of physic before and one immediately after calving, and, when the animal is in very high condition and prone to milk-fever, bleeding her a day or two before calving.

**Milkworts** (so called from the milky juice) are various species of plants belonging to the natural order Polygalaceae or Polygalaceae. The order comprises about 20 genera and 500 species which are widely distributed over the tropical and subtropical parts of the world; several species are natives of North America and of Europe. They are herbaceous plants, simple, or, occasionally in the latter case being of climbing habit. The leaves are usually simple and destitute of stipules; the flowers are irregular. Their qualities are generally tonic and slightly astringent; and some, as Krameria, are very astringent.—The Common Milkwort (*Polygala vulgaris*), an annual perennial plant, growing in dry hilly pastures, with an ascending stem, linear-lanceolate leaves, and a terminal raceme of small but very beautiful flowers, having a finely-crested keel. It varies considerably in size, in the size and even shape of the leaves, and in the size and colour of the flowers, which are sometimes of a most brilliant blue, sometimes purple, pink, or white.—*P. Senega* is a North American species with erect simple tufted stems, about one foot high, and terminal racemes of small white flowers. The root, which is woody, branched, contorted, and about half an inch in diameter, is the Senega Root, Seneka Root, or Snake Root of the United States, famous as an imaginary cure for snake-bites, but really possessing important medicinal virtues—stimulating, diuretic, diaphoretic, emenagogue, and in large doses emetic and purgative—employed in catarrh, pulmonary affections, rheumatism, low fevers, &c. Its chief active principle is Polyglycic Acid, C_{12}H_{11}O_{6}. The root of *P. vulgaris* is employed as a cure for snake-bites by the American Indians from time immemorial, and it is a curious fact that *P. crotalariaeoides* is employed in the same way in the Himalayas. *P. vulgaris* is tonic, stimulant, and diaphoretic; and *P. amara*, a very similar European species, possesses the same properties in a
higher degree, as does P. rubella, a small North American species. The root of P. pungens, a Balsam and woolly with a white juice, is in a state active, and in a fresh state is employed in bilious fevers. P. tinctura, a native of Arabia, furnishes a blue dye like indigo. P. venenosa is by the natives of Java dreaded on account of its noxious heavy odour, which they say causes severe headache and violent sickness. Another medicinal plant of the order is Rattany (q.v.) Root. The bark of the roots of Monnina polyotica and M. salicifolia is used in Peru as a substitute for soap; and Mandua spinosa, a South African shrub, produces an estable fruit.

**Milky-way.** See **Galaxy**.

**Mill.** This word is now used in a general way as a name for almost all kinds of manufactories, as well as for machines used for grinding; but in this article we shall hereafter it by a flour-mill. For other mills, see **SPINNING**, **WEAVING**, **COTTON, FLAX, WOOL, &c.**

From time immemorial, until quite recent times, wheat has always been ground between two stones. At first hand-mills were used such as are so often mentioned in the Bible and amongst civilised people (see QUERN); but the mill subsequently passed through many mechanical developments up to the large merchant mills now found in every civilised country, some of which recently combined upwards of three hundred of large millstones. They were made of 'basalt,' a very hard silicate, the best stones coming from the valley of the Seine. The millstones were circular, usually about four feet in diameter, formed of wedge-shaped pieces strongly cemented together, and bound together by hoops. The surfaces were cent into a series of radiating ridges and furrows, by which means the wheat was pushed from the centre to the circumference of the stones, as well as broken between the edges of the ridges. Great care had to be taken that the surfaces of the two stones were perfectly level and perfectly parallel to each other. Only the upper stone or 'runner' revolved, the lower or 'bedstone' being fixed. The first successful steam flour-mill was erected in London in 1784. The first of millstones were first practically tried at the roller mill in Pest, founded in 1840 by the patriarch Count Széchenyi. This new system, called 'the high grinding or gradual reduction roller system,' ultimately spread throughout Hungary, and made Budapest for many years the greatest flour-milling centre in the world. By 1875 this system had been adopted by the millers of the north-western states of America, and has enabled them to outstrip their teachers: Minneapolis is now the largest flour-milling centre in the world, and its mills send a great quantity of flour to England. Since 1880 this system has been universally adopted by large mills, and is being gradually introduced into small mills also. The great advantage of rollers over millstones is found to be that the former avoid the rasping of the outside of the wheat berry which was inseparable from millstones, and produced a small quantity of very dark powder which necessarily mixed with the flour and greatly deteriorated its colour.

The following is a description of the different processes which together form the 'high-grinding' or 'gradual reduction' system of flour-milling: (1) The wheat is cleaned or 'smutted,' as it is termed, by means of sifting, winnowing, and being put through a cylinder of wire-cloth, with rapidly revolving arms inside, which combines the actions of sifting and polishing the wheat. A machine furnished with hard brushes is often employed to scrub the wheat. (2) The cleaned wheat is sent to grooved chilled-iron rollers (see fig. 1), and slightly broken between them; the product is sifted by means of cylinders covered with wire-cloth or silk-gauze, by which means a proportion of flour is separated, mixed with a substance composed of small pieces of the floury part of the wheat berry, and called usually 'middlings,' sometimes 'semolina.' The pieces of broken wheat are sent to other rollers to be again broken, and the product sifted as before. This process is repeated from four to seven times, according to the ideas of the miller and the nature of the wheat, until, as far as possible, all the floury part has been scraped from the husk or 'bran,' which is sold for fodder.

![Fig. 1.—Roller Mill](image-url)

We are thus left with the mixture of flour and 'middlings' from the four to seven breaking processes. The products from the different breaking processes are generally mixed together and then sifted as before described, in order to separate the flour which is then ready for use from the 'middlings,' which are then put through the process called 'purification.' It may here be mentioned that the making of a large quantity of 'middlings' is the principal difference between the former 'low-grinding' and the present 'high-grinding' system, and is the chief advantage of the latter. By the former process it was sought to reduce the wheat at one grinding as far as possible into flour and bran; it was, however, found to be impossible to keep the two separate, a portion of finely-powdered bran being inevitably mixed with the flour, greatly to the detriment of the latter. By high-grinding, the floury part is reduced in the first instance principally to a granular state, and, though bran particles are mixed with the flour granules, they may be almost entirely separated, owing to the difference in their specific gravity, by means of this process of purification. (3) The size of the granules of the middlings varies from that of fine sand to that of a pin's head. The middlings are therefore first separated by sifting into as many sizes as may be thought desirable, and each size is sent to one or more machines called 'middlings' purifiers.' These are of two types, called 'gravity' and 'sieve' purifiers. In the first type, which is generally used for the large sizes of middlings, the material is directly acted on by a draught of air. The machine usually takes the form of a series of sloping boards, or of revolving discs, by either of which devices the middlings are caused to fall repeatedly in a thin even stream through a current of air produced by a revolving fan. As the specific gravity of the flour granules is greater than that of the bran particles, it is obvious that the current of air may be so regulated as to carry away the particles of bran, leaving the flour granules to fall to the bottom of the machine.

The sieve purifier generally takes the form of an oblong box, or case, of wood; occupying the centre
plane of this case a sieve formed of silk-gauze is suspended by springs from the top of the case, and is made to oscillate by means of a crank. A revolving fan is placed at the top of the machine, which draws air through the meshes of the sieve, the current of air being so regulated that the loose particles are either carried away by the draught to a suitable receptacle, or are kept suspended on the top of the sieve until they are carried over the end of it, while the heavier flour granules fall through the sieve. This type of machine is always used for the smaller sizes of middlings. It is the dust drawn from these machines by the fans that, when mixed in a certain proportion with air and accidentally ignited, has caused several very serious explosions in flour-mills. In consequence of this, whereas it was formerly usual to send this dust-laden air to a large chamber where the dust was allowed to settle by its own weight, and where the explosions generally occurred, within recent years many ingenious contrivances called 'dust collectors' have been invented for separating the dust in small quantities, and thus minimising the danger. These are now generally used. The middlings, after being thoroughly cleaned (by repetition of the process when necessary), are ground between smooth chilled-iron rollers and the product sifted; the flour thus produced is of fine quality, and is usually called 'patent' flour. Millstones may still be profitably employed to grind the finest sizes of middlings, but this is the only use to which they are put in a modern mill.

Fig. 2 represents one type of cylinder used for sifting (technically, 'dressing') the products in flour manufacture, to which we have several times had to refer. These cylinders are of two kinds, the ordinary 'reel' or cylinder being a framework covered round with wire-cloth or silk-gauze, and made to rotate, thus setting in motion the enclosed material. The other type is called a 'centrifugal dressing' machine (see fig. 2). In this machine, in addition to the rotating cylinder, there is a frame with long pieces of wood or iron attached, made to revolve independently inside the cylinder. By this means the material is thrown against the circumference of the cylinder, so that a much smaller surface is required than in the ordinary reel to do the same amount of work. The 'Planschlichter,' introduced in Budapest in 1888, whilst, as its name implies, is a horizontal sieve, has a special contrivance for keeping the material in motion, and the meshes clear. This machine has made considerable progress in Hungary, but it is as yet too early to predict that it will supersede the cylindrical 'dressing' machines. Almost all modern mills are constructed on which is termed the automatic system, which means that all the conveyance of the material from one point in the mill to another is done by mechanical means; so that of the great bulk of the flour it may be said that it is never stopped or touched on its journey from the time it leaves the wheat sack until it reaches the flour sack. The conveyer generally used to move material in a horizontal direction is a helical screw, but sometimes a screw is attached to a crank and is raised to a higher level by means of cranks (q.v.) are used.

See Fairbairn, Mills and Mill-work (1878); Kick, Flour-manufacture (trans. 1878); Voller, Modern Flour Milling (1889); Bennett and Elton, History of Corn Milling (1888).

Mill (Lat. mille, 'a thousand'), in the United States, is the tenth part of a cent, the thousandth part of a dollar. As a coin it has no existence.

Mill, James, was the son of a shoemaker, and was born in Logie-Port parish, near Montrose, Scotland, 6th April 1773. He studied, with a view to the church, at the university of Edinburgh, where he distinguished himself in Greek and in Moral and Metaphysical Philosophy. He was licensed to preach in 1798; but instead of following out the ministry, he went to London in 1802, where he settled as a literary man. He became editor of the Literary Journal, which after a time was discontinued; and wrote for various periodicals, including the Eclectic and the Edinburgh Review. In 1806 he commenced his History of British India, which he carried on along with other literary work, and published in the winter of 1827-28. This history was so popular that many requests were made for the second edition, which was published in 1828. In 1829 he published his Elements of Political Economy, a work prepared primarily with a view to the education of his eldest son, John Stuart Mill. In 1830 his Analysis of the Human Mind appeared. His last published work was the Fragment on Macintosh, brought out in 1835. He was also a contributor to the Westminster Review, and to the London Review, which merged in the London and Westminster.

Not long after he settled in London, he made the acquaintance of Jeremy Bentham, and for a number of years lived during the summer in Bentham's country-house. Although he must have derived some much benefit from his intercourse with the great law-reformer, he was not a mere disciple of Bentham, but a man of profound and original thought, as well as of great reading, in all the departments of moral, mental, and political philosophy. His conversation was impromptu only, and never lacking in a powerful intellectual stimulus to a number of young men, some of whom (including his own son, and Grote, the historian of Greece) have since risen to eminence. He took a leading part in the founding of University College, London. He died at Kensington, 29th June 1850.

See the Autobiography of J. S. Mill; and Professor Bain's James Mill (1882).
Mill, John Stuart, the eldest son of James Mill, was born in London on 20th May 1806. He was educated by his father, by whom he was subjected from his earliest years to a careful and systematic training, which was to fit him to carry on the work and champion the opinions with which the elder Mill was identified. Almost from infancy he was his father's intellectual slave. He is said to have begun Greek at the age of four, and before he was fourteen he had read extensively in Greek, Latin, mathematics, and English, had begun logic and political economy, and already possessed the intellectual acquirements of a well-educated man. Before he was seven he was able to complete his own age. As he himself says, he 'never was a boy.' His nearest approach to recreation was the long walks—in reality peripatetic oral examinations—for which he was regularly taken by his father. In 1820 he went to France on a visit to the family of Sir S. Bentham (Jeremy Bentham's brother), and was thus removed for more than a year from his father's immediate influence. His studies were never interrupted. His residence in France not only gave him a keen interest in French politics and social conditions, but stimulated his botanical examination of the vegetable forms of life, which became the chief relaxations of his arduous life. After his return home he worked at history and law, and read the English and French philosophers. His first published writings appeared in the Edinburgh newspaper in 1822. In the following year a career was secured for him by an appointment under his father at the India Office, from which he retired as head of his department in 1838, on the transfer of the Company's government to the crown. At the same time he declined a seat in the House of Commons, and moved to London and his old home at Claydon, near Derby. During the years 1825-26 he was a member of a small Utilitarian society which met for the purpose of discussion at Jeremy Bentham's house. The name 'Utilitarian' was suggested by an expression in one of Galt's novels, and seized upon by him, 'with a joy's fondness for a name and a banner,' to describe himself and others of like opinions. In the Speculative Society, which was founded in 1825, and of which he remained a member till 1829, he met men of a greater variety of opinions and views, and formed an intimate friendship with Maurice and Sterling, and other men of different types from those he had met at his father's house, and influenced by Coleridge, not by Bentham.

Before he was twenty, Mill was recognised as the champion and future leader of what may be called the Utilitarian School of philosophy and politics, and had become the most frequent contributor to the newly-established organ of the party, the Westminster Review. But the 'mental crisis' through which he passed at this time (1826-27) led to a modification of his attitude. Bentham's Treatise on Legislation, which he had read four or five years before, formed the keystone of his previous position. It gave him a creed, a doctrine, a philosophy; in one among the best senses of the word, a religion; the incitation and diffusion of which could be made the principal outward purpose of a life. The crisis which his enthusiasm for his old creed and opinions broke down was attributed by himself not merely to a dull state of nerves, but to the purely intellectual education which weakened his sympathies at the same time that it increased his power to feel them to their origin. He ultimately emerged from the state of depression by discovering that feeling was not dead within him. The experiences of this period left, he tells us, two very marked effects on his opinions and character. In the first place, they led him to a new conviction of the limits of human knowledge. The conviction was forced upon him that happiness—although the test of all rules of conduct and the end of life—was only to be obtained by not giving in the direct and conscious hand into sense and fixed on some such ideal end as the improvement of mankind, or even some art or pursuit. His 'mental crisis' further led him to see the necessity for human well-being of the internal culture of the individual. He ceased to attach exclusive importance to the ordering of the direct and conscious hand into sense, and forced training of the human being for thought and action. And soon after this time he found in Wordsworth's poems 'the very culture of the feelings' he was in quest of.

The wide experience of speculation and literature brought about by this new attitude may be seen in his reviews of Tennyson's poems (1835), and of Carlyle's French Revolution (1837), as well as in his article on Coleridge (1840). His article on Bentham (1838) made clear the extent of his divergent force which combined these aspirations and their copies, or ideas, into systems of thought, modes of feeling, and habits of acting. His System of Logic (1843)—perhaps the most original and important of his works—traces, and gives a rationale of, the way in which the real, disjointedly given in sensations, is interpreted as knowledge. Its treatment of the methods of inductive science—in which it owes much to Herder, Schelling, and Comte—has become classical. His Examination of Sir W. Hamilton's Philosophy (1867) and of that James Mill's Analysis of the Phenomena of the Human Mind (1869), contain a polynemic defence and exposition of the association-psycho logical, notable for their clear recognition of the mental elements which that psychology assumes without explanation. His essay on Utilitarianism (1861) defends the greatest-happiness theory, but suggests modifications inconsistent with it (see Ethics, p. 433 b.). He held that government was to be purified and made into a utilitarian instrument by means of representative institutions; but by less confidence in Bentham and his father he had in the effect of reason upon men, disapproved of an equal suffrage, distrusted the ballot, and argued eloquently for individual liberty of thought and action against the tyranny of the majority (Considerations on Representative Government, 1866, On the Benthamite System and On Liberty, 1859; On Liberty, 1859). His Principles of Political Economy (1848) is a systematic treatise, which does not depart in its main teaching from the theory laid down in abstract fashion by Ricardo; but it recognises more clearly the hypothetical character of this theory, and it discusses the social applications of economic doctrines. Mill was M.P.
for Westminster from 1855 to 1863. In parliament he voted with the advanced Radical party; and his advocacy of women's suffrage in the debates on the Reform Bill of 1867 led to an active movement for placing the legal and political rights of women on the same footing as those of men. Mill died at Avignon, 8th May 1873, and was buried in the cemetery there.

In addition to the works already mentioned, Mill was the author of Essays on some unsettled Questions of Political Economy (1853), Subjection of Women (1869), and Autobiography (1873), and Three Essays on Religion (1874). His more important occasional writings are collected in four volumes of Illustrations and Discussions (1860-75). His views on various opinions, see biographies by A. Bain (1882) and W. L. Courtney (1889), and a study by C. M. Douglas (1890).

Mill, John, a New Testament critic, was born about 1545, at Shap in Westmorland, entered Queen's College, Oxford, as scholar in 1561, and was successively fellow and tutor of his college, rector of Blechington in Oxfordshire (1631), principal of St Edmund's Hall (1635), and prebendary of Canterbury (1704). He died 23d June 1707, just fourteen days after the publication of his great New Testament (1706). He is the thirty-third of various readings, the labour of thirty years.

Millais, Sir John Everett, P.R.A., painter, was born at Southampton, 8th June 1829, the descendant of an ancient Jersey family. In the winter of 1838-39 Millais began to attend the drawing academy of Henry Sass, passing, two years later, into the schools of the Royal Academy. At the close of his studies he exhibited in the Royal Academy his 'Pizarro seizing the Inca of Peru,' ranked by competent critics of the day as on a level with the best historical subjects then shown. Till now his work had been upon the lines of art generally current in England at the time; but there followed a phase of revolt from accepted standards, a period of search for new paths. He became associated with the knot of young artists known as the Pre-Raphaelite Brotherhood, of whom the other chief were Dante Gabriel Rossetti and Holman Hunt; and undoubtedly he was marvelled, and men marvelling, by the powers of both of these men, and by Mr Ruskin their literary ally. From them, in particular, his art received an impetus towards imagination and symbolism, which—has been proved by the criticism and mark of all subsequent qualities from his later and more independent productions. These were great extent foreign to his native genius. His marvellous technical skill enabled him to embody in visible artistic form conceptions that were essentially those of others with far greater adequacy than their own less trained hands could possibly have done. His first Pre-Raphaelite picture, a scene from the Isabella of Keats, strongly recalling the manner of the early Flemish and Italian masters, figured in the Academy in 1849, where it was followed in 1850 by the striking 'Christ in the House of his Parents,' in the year of 'The Carpenter's Shop,' in 1851 by 'The Woodman's Daughter,' in 1852 by 'The Huguenot' and 'Ophelia,' and in 1853 by 'The Order of Release' and 'The Proscribed Royalist.'

In 1856 he was elected an Associate of the Royal Academy, and in 1859 he was elected the first and most poetical of the productions of his Pre-Raphaelite period—the 'Autumn Leaves' in 1856, the 'Sir Isambra at the Ford' in 1857, and 'The Vale of Rest' in 1859. In the finer of the works which ensued ('Hylas is my Darling' [1864])—the year in which the painter received full academic honours—'The Minuet' (1861), and 'Rosalind and Celia' (1868), the precision and clear definition of Pre-Raphaelite methods still survive; but in the exquisite 'Gambier's Wife' (1869) there became visible a larger and freer method of handling, which is yet more fully established in 'The Boyhood of Raleigh' (1870), a picture in which, as in many of his earlier subjects, marks the transition of his art into its final and, technically, most masterly phase, displaying all the brilliant and effective colouring, the effortless power of brush-work, and the delicacy of flesh-painting. The interest and value of his later works lay in their splendid technical qualities. In great part they are actual or fancy portraits, varied by a few important landscapes, of which in many ways the finest is 'Chill October' (1871), and by such an occasional figure-piece as 'The North-west Passage' (1873) and 'Effie Deans' (1877). Millais executed a few etchings, and his innumerable illustrations, dating from about 1857 to 1864, and most of them published in Good Words, Once a Week, and the Cornhill Magazine, placed him in the first rank of woodcut designers. He was D.C.L. of Oxford; in 1885 he was created a Baronet and elected P.R.A. in February 1886, and died 13th August of the same year. A collection of nearly twenty of his works was brought together, by the Fine Arts Society, London, in 1881, and 159 examples of his art formed the Grosvenor Gallery Winter Exhibition in 1886.

See Ruskin's Notes on that exhibition: Armstrong's Life and Work of Millais (1885); Sir W. Richmond, Leighton, Millais, and William Morris (1888); M. H. Spielmann, Millais and his Work (1898).

Millau, a town of Aveyron, France, on the Tarn, 92 miles N.W. of Montpellier. During the 16th and 17th centuries it was a Calvinist stronghold. Leatherwork was a large industry at this place, and there is a good trade. Pop. (1872) 13,879; (1886) 14,705; (1891) 15,871.

Millbank Prison, or The Penitentiary, demolished in 1891, was situated in the parish of St John's, Westminster, facing the Thames. It was erected at an enormous cost to carry out the plans of the philanthropists Howard and Benham; the latter's contract with the Treasury was signed in 1794, but the building was not actually commenced till 1812, and not completed till 1821. It had accommodation for 1100 prisoners, and was so constructed that, from a room in the centre, the governor was able to view all the cells; in which solitary confinement was rigidly enforced. Convicts condemned to penal servitude used to undergo first a term of solitary confinement in Millbank; but the prison ceased to be a convict establishment in May 1886, and was finally closed in November 1890. See Griffiths, Memorials of Millbank (24 ed. 1884).

Millboard is the name given to 'board' made of paper material, and varying in thickness from 1/6th to 1/4th of an inch. It is of a grey colour, as the various kinds of waste substances—viz. old ropes, old sucking, scraps of paper and of cardboard—from which it is made, are not bleached either separately or when mixed and reduced to a pulp, as in the manufacture of white paper (see Paper). The best millboard, such as that employed for binding ledgers, is made on moulds by hand; but by far the larger quantity of millboard put on the market is made by machines. In the latter a revolving wire-cloth cylinder dips into a cistern containing the pulp, and takes on a layer of it about the thickness of stout brown paper. This pulp layer is by pressure taken continuously off the wire cylinder by a felt blanket passing over a wood roller. The felt carries the single layer, in the wet state, to a pair of rollers 7 feet away from the wire cylinder. Here the layer is wound upon
the upper or wooden roller till the required thickness is made up. The lower or iron roller presses by means of the lever, and the weight at almost the one with sufficient force to consolidate the layers of pulp. The hollow cylinder of millboard on the wood roller is then cut longitudinally with a knife, and opened out into a flat sheet. It is afterwards dried by steam heat or otherwise, calendered by chilling iron rolls, and cut to size by strong circular cutters.

Millboard is used for bookbinding and for making boxes, but has been largely superseded by Strawboard (q.v.). It is still employed for jointing flanged pipes and other engineering work; but for this purpose asbestos millboard (see Asbestos) is now preferred. Millboard or thick cardboard made from straw or wood is used for many miscellaneous purposes. Mounting board consists of several layers of paper pasted together. A few years ago a mill on a large scale was in operation near London for the manufacture of millboard from stable manure, but the process was not a success commercially.

Millbury, Massachusetts, on the Blackstone River, is 30 miles by rail W. of Boston, and has several cotton and woollen factories. Pop. 4400.

Milledgeville, the former capital of Georgia (q.v.), is 22 miles N.W. of Milledgeville, Macon.

Millenary Petition. See HAMPTON COURT.

Millennium (Lat., ‘a thousand years’), a long indefinite period, after the kingdom of Messiah will, according to the belief of many Christians, be visibly established on the earth. The idea originated proximately in the Messianic expectations of the Jews; and the Christians’ belief in the Parousia, or Second Coming of Christ, was developed from it. The period of which there were long subject. The chief basis of the millenarian idea, in Judaism as well as in Christianity, is the ancient hope for a visible divine rule upon earth, and the identification of the church with that of which it is nearly a symbol. In the 1st century of the church, chiliastism (the Greek equivalent of millenarianism, from chilios, ‘a thousand’) was a widespread belief, to which the books of Daniel and the Apocalypse (chaps. xx. and xxi.) gave authority; while various prophetic ideas, of the most extreme lat and the beginning of the 2d century—such as the Testament of the Twelve Patriarchs, the Christian Sybilline Books, the Epistle of Barnabas—lent it a more vivid colouring and imagery. Not only the heretic Cerinthus, but even orthodox doctors—such as Papias of Hierapolis, Irenaeus, and Justin Martyr—delighted themselves with dreams of the glory and magnificence of the millennial kingdom. The Sybilline Books, for instance, held that the earth will be cultivated throughout its length and breadth, that there will be no more seas, no more winters, no more nights; everlasting wells will run honey, milk, and wine. Papias indulges in monstrous representations of the rebuilding of Jerusalem, and of the colossal vine and grapes of the millennial reign.

Millenarianism is often, in one opinion, which was as much Christian as Jewish, the millennium was to be preceded by great calamities. The personification of evil appeared in Antichrist (q.v.), the precursor of Christ (identified during the 1st century with Simon Magus in Luke xxii. 53 and 54), a frightful war in the land of Magog (Ezek. xxxviii. and xxxix.) against the people Gog, after which the Messiah would appear, heralded by Elias, or Moses, or Melchizedek, or Isaiah, or Jeremiah, and would bind Satan for a thousand years, annihilate the godless heathen, or make them slaves of the believers, and overture the Roman empire. From its rise a new order of things would spring forth, in which the ‘dead in Christ’ would arise, and along with them the righteous dead. This parable is of the city of the ‘New Jerusalem,’ which was expected to descend literally from heaven. With the innocence which was the state of man in Paradise there was associated, in the prevalent notions of the millennium, great physical and intellectual changes.

The lapse of time, chilling the ardour of the primitive Christian belief in the nearness of the Parousia, had without doubt also the tendency to give a more shadowy, and therefore a more spiritual aspect to the kingdom over which the expected Messiah was to reign. The influences of the Alexandrian philosophy contributed to produce the same result. Origen, for example, started the idea that, instead of a final and desperate conflict between Paganism and Christianity, the real progress and victory of Christianity would consist in the gradual spread of the truth throughout the world, and in the voluntary homage paid to it by all seeing powers. Yet even in the Egypto-Alexandrian Church millenarianism, in its most literal form, was widely diffused. The Montanists (q.v.) generally held a future divine rule on earth, and, being considered a heretical sect, contributed largely to bring chiliasm into disrepute, or, at all events, their own eminal form of chiliasm, which Tertullian himself attacked. Laetantius, in the beginning of the 4th century, was the last important Christian writer who voiced chiliasm dreams. In the 5th century, St Jerome and St Augustine expressly combated certain fanatics who still hoped for the advent of a millennial kingdom whose pleasures included those of the table. From this time the Church slid, millenarianism in its sinister ‘visible form,’ although the doctrine every now and then made its reappearance, especially as a general popular belief, in the most sudden and obstinate manner. Thus, the expectation of the Last Day in the year 1000 a.d. reinvisted the doctrine with a trinity importance.

At the period of the Reformation, millennialism once more experienced a partial revival, because it was not a difficult matter to apply some of its symbolism to the papacy: the pope, for example, was consecrated, as it was said, from the table of the Millennium, and by the use of the power of the Keys; and was, therefore, adopted by the great body of the Reformers, but by some fanatical sects, such as the Anabaptists, as also by various theosophists in the next century. During the civil and religious wars in France and England it was also prominent; the Fifth Monarchy Men (q.v.) of Cromwell’s time were millenarians of the most exaggerated type. The extravagances of the French Mystics and Quietists culminated in chiliasm views. During the Thirty Years’ War enthusiastic and learned chiliasm flourished. Among the foremost chiliasm teachers of modern centuries are to be mentioned Exechiel Meth and Bishop Conenius in Germany; Professor Jurieu of Solan, and Poiret; Serratius in Holland; and in England Joseph Mede (Clev. Aprod. 1627), while Thomas Burnet and William Whiston endeavoured to give chiliasm a more scientific form. Most of the chief divines of the Westminster Assembly were millenarians; so were Sir Isaac Newton and Bishop Horsley. Bengel revived an earnest interest in the subject among orthodox Protestants. Spencer and Leibnitz held the doctrine; Schleiermacher employed apocalyptic images to set forth the transfigured world of the senses. Bengel’s millenarianism was adopted by the Swabian theosophist Oetinger (died 1782), and widely spread throughout Germany by Jung Stilling, Lavater, and Less. Charles Wesley and Toplady were millenarians.

Modern millenarians or pre-millenials (as
MILLEPEDE

believing in the pre-millennial advent of Christ) differ in many minor points from one another, but agree in holding that the millennial age will be heralded by the personal return of the Lord Jesus, to establish a theocratic kingdom on earth, in which righteousness and truth will reign, and white rocks will remain on earth but be greatly diminished. Immediately on Christ's appearing will take place the resurrection of the righteous dead and the translation of living Christians, who will be rewarded according to their works. The judgment of the nations will occur, and will exist throughout the millennial period. The Jews, restored to their own land, will repent and be converted. All the hosts of Antichrist will be destroyed, Satan bound, and the Holy Ghost poured out. At the end of the millennial age Satan will be thrown into the lake of fire, and his hosts into the same. The earth will be renewed by fire, and be the scene of the everlasting kingdom of Christ over all sanctified mankind. Attempts to fix the date of the advent are generally disapproved. Dates that have been fixed for the beginning of the millennium have been 1785 by Stilling, 1836 by Bengel, 1843 by Miller in America, 1860, 1867, and 1868 by Dr. Cumming, and 1800 by the Mormon Church. Some adventists teach the doctrine of pre-tribulation (a.q.), others the final annihilation of the impenitent. See Adventists (second), and Hell.

Many of the greatest modern German theologians have been more or less pronouncedly pre-millennialists; such as Rothe, Hofmann, Nitzsch, Ebrard, Lange, Delitzsch, Christieth, Luthardth, as also Osterzee, Gaussen, and Godet. The Free Church of Italy and the Plymouth Brethren collectively hold these views. The Irvingites expect the speedy appearance of Christ. Pre-millennial views appear in the writings of many important Anglicans, such as Archbishop Trench, Bishop Ellicott and Ryle, Canon Fremanville and Hoare, Dean Alford. Amongst Presbyterians Dr. John Cumming and Dr. Horatius Bonar are conspicuous names. Great conferences of pre-millennialists were held in London in 1879. See Correlli, Geschichte des Chiliasmus (1781; 24 ed. 1794); J. P. Lange, Das Land der Herrlichkeit (1838); Volek, Der Chiliasmus (1859); Bickersteth, Glory of the Church (1853); Bonar, Coming of the Kingdom of Jesus (1859); Preparatory Landmarks (1859); Cumming, Apocalypse Sketches (1849); E. B. Elliott, Horn Apocalypse (5th ed. 1862); Sismon, The Last Times (7th ed. Phila. 1872); the Pre-millennial Essays of the attempted Complete Gonfalo (Chicago, 1879); and, against Millenarianism, David Brown, Christ's Second Coming (1846).

Millepede, a popular name for the members of one of the orders of Myriapods, of which Julus is a good type. See Centipede, Myriopoda.

Millepore. See Coral.

Miller, Hyrum, a distinguished self-taught geologist, was born at Cromarty, in the north of Scotland, October 12, 1805. He was descended from a family of sailors, and lost his own father by a storm at sea when he was only five years of age. In consequence of this misfortune he was brought up chiefly under the care of his maternal uncle, John Miller of 'Sandy.' He imbued him with a taste for natural history, and the other ("Uncle James") for traditional lore. He acquired a good knowledge of English (the only language he knew) at the Cromarty grammar-school. Before his eleventh year he had read the usual romances of childhood, besides other works of higher literary pretensions. As he grew older he became extremely fond of the great English poets and prose-writers. From his seventeenth to his thirty-fourth year he worked as a common stone-mason, devoting the enforced leisure of the winter months to writing and reading, to independent researches in natural history, and to the composition of inventions. In 1829 he was invited to Edinburgh by Dr. Candlish and Robert Paul, who had read his famous letter, as editor of the Witness, a newspaper started in the interest of the Non-interruption party in the Church of Scotland; and in 1830 he published in its columns a series of geological articles, which were afterwards collected into the title of The Old Red Sandstone, or New Walks in an Old Field (1841). These articles were very remarkable, from both a scientific and a literary point of view. They contained a minute account of the author's discovery of fossils in a formation believed, until then, to be pre-tribulation (a&q.), others the final annihilation of the impenitent. See Adventists (second), and Hell.

Miller, Horace, a distinguished journalist and geologist. He was the second son of Hyrum Miller, and was born at Cromarty, Scotland, January 23, 1825. He was educated at the University of Edinburgh, on the night of the 23rd December 1835. Miller contributed several tales to the series known as Wilson's Tales of the Borders (1833), and was also a contributor to Chalmers' Journal. He was not a ready writer; Chalmers said of him that he was as steady as a London clock, but he required a deal of time to lend. Yet he contributed at least a thousand articles to the Witness; Peter Bayne terms them complete journalistic essays, symmetrical in plan, finished in execution, and of sustained and splendid ability. Miller's works, besides those already mentioned, are First Impressions of England and its People (1847), the record of a journey to England in 1845; Footprints of the Creator, or the Astrolabe of Stromness, in which he expounded the evolution theory (1850); My Schools and My Schoolmen, or the Story of My Education (1854); and Testimony of the Rocks (1857), an attempt to reconcile the cosmogony of Genesis with the geology of nature, by the hypothesis that the days mentioned in the first chapter of Genesis do not represent the periods of the earth's history, but only the time occupied by God in unrolling a panoramic vision of these periods before the eyes of Moses. To the above list was afterwards added the following posthumous volumes: Cruise of the Beatty (1848), being geological investigations on board the Beatty, of the Northumbrian Naturalists' Club; Popular Geology, with preface by Mrs Miller (1850); Headship of Christ, with preface by Bayne (1861); Essays, Historical and Biographical.
Millet

Millet, Joaquín, the pen-name of Cincinatius Hiner Miller, an American poet, born in Indiana, in 1841. Removing with his parents to Oregon in 1854, he became a miner in California, was with Walker in Nicaragua, and afterwards lived with the Indians of Chile. He then studied law in Oregon, and set up in practice in 1863, after a Democratic paper that he edited had been suppressed for disloyalty. He was a county judge from 1866 to 1870, and then visited Europe; in England his first volume of verse was published. He afterwards settled as a journalist in Washington, and in 1887 in California. In 1890 he revisited England.

His poems include Songs of the Sierras (1871), of the Sunlands (1873), of the Desert (1875), of Italy (1876), and of the Mexican Sierras (1887); his prose works, The Danites in the Sierras (1881), Shadows of Shasta (1881), and "Or the Gold-seekers of the Sierras" (1884). He also wrote The Danites, a successful play, and My Life among the Modocs (1875).

Miller, Joe. See Jest-Books.

Miller, William. See Adventists.

Miller, William Hallows (1801–80), professor of Mineralogy at Cambridge, is especially distinguished for his system of Crystallography (q.v.).

Miller's Thumb. See Bullhead.

Millet, a grain, of which there are several kinds, the produce of species of Panicum, Setaria, and allied genera. The genus Panicum contains many species, which in temperate and tropical countries, and some of which, as Glyceria Gracilis (q.v.), are amongst the largest fodder grasses. The flowers are in spikes, racemes, or panicles; the glumes very unequal, one of them often very minute; each spikelet containing two florets, one of which is often barren. The genus Setaria has a spike-like panicle, with two or more bristles under the glumes of each spikelet.—Common Millet (Panicum miliaceum) is an annual grass, three or four feet high, remarkably covered with long hairs, which stand out at right angles. It has a much-branched nodding panicle; the spikelets are oval, and contain only one seed. It is a native of the East Indies, but is extensively cultivated in the warmer parts of Europe and other quarters of the world. The grain, which is very nutritious, is only about one-eighth of an inch in length. It is used in the form of groats, or in flour mixed with wheat-flour, which makes a good kind of bread; but bread made of millet alone is brittle and full of cracks. Poultry are extremely fond of millet.—Other species, P. vindemiaeum, P. frumentaceum, and P. pilosum, are cultivated in different parts of India, chiefly on light and rather dry soils, yielding very abundant crops. Millet of various species is the staple food-grain of India as a whole, and not rice, as is often thought.—German Millet, or Mohar (Setaria germanica), and Italian Millet (Setaria italicna)—regarded by many as varieties of one species, and probably originally from the East, although now naturalised in the south of Europe—are cultivated in many of the warmer parts of Europe, in India, and other countries. Italian millet is three or four feet in height; German millet is much lower, and its spike comparatively compact, and erect; it is less valuable as a corn-plant. The grains of both are very small, only about half as long as that of Common Millet; but they are extremely prolific, one root producing many stalks, and one spike of Italian millet often yielding 6000 ounces of grain. The produce is estimated as five times that of wheat. The grain of these millets is imported into Britain for feeding cage-birds. It is used for soup in the south of Europe. To the same tribe of grasses belong the genera Phalangium, Pennisetum, Pennicillaria, Dighiera, and Millum. Paspalum androscoriana is common in Africa; and P. scrobiculatum is cultivated on poor soils in India. Pennicillaria spinacea or Pennisetum typhoidicum, often called Egyptian Millet and Guinea Corn, is cultivated in Africa and India, and the south of Europe. Pennisetum glaucum causes much inconvenience to the traveller in Central Africa, the little bristles which are attached to its seeds making them stick to the clothes and pierce the skin.—Ditharia sanguinolenta, or Polish Millet, is cultivated in Poland, where the grain is used like rice. Pennisetum elatum is a common grass in tropical and warm countries, and in many parts of Europe; in Britain it occurs in the south of England, where it is probably only an introduced weed of cultivation. The spikes in this genus are compound, and from their appearance give it the names Digitaria and Finger-grass.—The Millet Grass (Milletum effusum) of Britain, occasionally found in shady woods, is a very beautiful grass, three or four feet high, with a spreading pale panicle of small flowers. Another species of the same genus (M. nigricans) is the Maize of Guinea of Peru, where its seeds are converted into a very white flour.—The name Indian Millet is sometimes given to Dura (q.v.).

Millet, Jean François, painter, was born in the village of Gruchy, near Gréville, on the 4th of October 1759. The son of a farmer, he owed much in his childhood to his grandfather, a woman of great piety and individuality, and to her brother, who had been a priest; and he was taught enough Latin to enjoy the Vulgate and Virgil. For a time he added his father as a farm-labourer; but, having manifested a great taste for drawing, he was at length, in 1832, placed under Moncel, a painter in Cherbourg, whom he assisted in the execution of two sacred subjects now in the church of the Trinity there, and who induced the municipality
of Cherbourg to grant an annuity to aid his pupil in his studies being afterwards supplemented by the council of La Manche. In 1837 Millet came to Paris, and worked in the studio of Paul Delaroche, learning, however, more from his study of the works of Michelangelo, Poussin, Correggio, and the Venetians. Next he painted and drew in Paris, and in 1838 he visited England. In Paris he struggled hard amid the revolutionary troubles that followed to maintain himself and his family by his art. In 1848 he fought at the barricades of the Quarter Roche-chouart; and in the following year he settled in Barbizon, near the Forest of Fontainebleau. Along with his teacher Charles Jacque, and there made the acquaintance of Theodore Rousseau. At Barbizon, where he remained for the rest of his days, living much like the peasants around him, he began in good earnest to paint the life of rustic France, entering upon a sublime struggle with such a genius as no other painter has shown. Here the famous 'Sower' was completed in 1850, mainly, however, from recollections of Normandy. In 1855 his 'Peasants Gathering' won Gautier's praise, and was bought by an American for 4000 francs. It was followed by 'The Clearears' in 1857, 'The Angelus' (1859), 'Waiting' and 'The Sheep-shearers' (1861), 'The Man with the Hoe' and 'Women Carding' (1863), 'Shepherdess and Flock' (1864), works in which, without any departure from the most absolute truth, he imparted a beauty and a poetic dignity to his figures of the men and women who labour in the fields, and to their environments of ordinary nature. In addition to paintings, he produced many charcoal drawings of a very high quality, and he etched a few plates. All his life long he struggled against the preconceived prejudices of his contemporaries, but though he received medals at the salons of 1853 and 1854, and a first-class medal at the Paris International Exhibition of 1867, when he also received the ribbon of the Legion of Honour. He died at Barbizon, 20th January 1875. Since his death he has been fully recognised as one of the greatest of French painters, and the productions of his brush have realised very large prices. At the Sèvres sale in Paris, in 1889, his most celebrated picture, 'The Angelus,' sold—along with the government commission of 5 per cent.—for £25,226; it was afterwards exhibited for a year in the United States.

See works on Millet by Redinguel (1876), Sensier (Eng. trans. 1881), Yriarte (1884), Minard (1890), Roger-Miles (1895); D. C. Thomson, The Barbizon School (1890); and his Life and Letters by Julia Cartwright (1896).

Millet, the French collective name for a thousand and one individual figures grouped with the five millions of France (5000 millions of francs, or £200,000,000) paid by France as war indemnity to Germany in 1871-73 (see France, Vol. IV, p. 780).

Milloon, a town of Cumberland, on the west side of the Duddon estuary, 30 miles SSE. of Whitehaven. It has mines and ironworks. Pop. (1851) 1076; (1861) 2225; (1891) 8850.

Milman, Henry Hart, dean of St Paul's, poet and ecclesiastical historian, was the youngest son of Sir Francis Milman (1746-1821), physician to George III., and was born in London, 10th February 1791. He was educated at Greenwich under Dr Burney, at Eton, and at Brasenose College, Oxford, where in 1812 he won the Newdigate with his Belevedere Apollo, the best of all Oxford prize poems. In 1815 he was elected a fellow; in 1816 was ordained priest, and appointed vicar of St Mary's, Reading; from 1821 to 1831 was professor of Poetry at Oxford, where in 1827 he delivered his famous Lectures, On the Character of Evidence and Conduct of the Ancient and Modern Prophets; in 1835 became rector of St Mary's, Westminster, and a canon of Westminster; and in 1839 was promoted to the deanery of St Paul's. He died at Sunninghill, near Ascot, 20th July 1844, and was buried in the church of St Paul's.

The collected editions of Dr Milman's Poems and Dramatic Works (3 vols. 1839) comprises Fazio, a Tragedy (1815), which, without his consent, was acted first at Bath, and then in 1818 at Covent Garden, with Charles Kemble and Miss O'Neill in the leading parts. Somor. Lord of the Bright City, an heroic poem (1818); The Fall of Jerusalem (1820), a beautiful dramatic poem, with some fine sacred lyrics interspersed; three other dramas, The Martyr of Antioch (1822), Belshazzar, (1822), and Anne Boleyn (1826); and Nala and Damayanti, with the other Poems, has been altogether forgotten. As a whole, the poem lives, and will live through three or four much prized hymns—

"When our heads are bowed with woe," 'Brother, thou art gone before us,' and 'Ride on, ride on in Majesty.' The complete edition of Dean Milman's Historical Works (15 vols. 1850-57) comprises History of the Jews (1850), History of Christianity to the Abolition of Paganism in the Roman Empire (1840), and History of Latin Christianity to the Pontificate of Nicholas III. (1854-56). The last—"a complete epic and philosophy of medieval Christendom"—is really a great work, great in all the essentials of history—subject, style, and research. But, though vastly inferior, the History of the Jews was in a way more important. For 'it was,' in Dean Stanley's words, 'the first decisive inroad of German theology into England; the first palpable indication that the Bible "could be studied like another book;" that the characters and events of the sacred history could be treated at once critically and reverently.' Milman also edited Gibson and Horne, and wrote much for the Quarterly Review. After his death, his son, Sir Anthony Milman, M.P., edited his Works, including the Quarterly Review, 1868, and Savonarola, Erosania, and other Essays (1870). See an article by Dean Stanley in Macmillan's Magazine for January 1869.

Milne-Edwards, Henri, naturalist, was born at Bruges, 23rd October 1800. His father was an Englishman. Milne-Edwards studied medicine at Paris, where he took his degree of M.D. in 1825, but devoted himself to natural history. After having for many years taught natural history at the Collège de Henri IV., he was elected in 1838 member of the Académie des Sciences in the place of Cuvier. In 1839 he became professor of Natural History and of the Gard du Plantes, and in 1844 became also professor of Zoology and Physiology. He was a member of the Académie de Médecine, and of most of the learned academies of Europe and America, and held several orders—amongst others, since 1860, that of Commander of the Legion of Honour. He published numerous original memoirs of importance in the Annales des Sciences Naturelles, a journal he himself assisted in editing for fifty years. His Eléments de Zoologie (1834), when reissued in 1831 as Cours Elémentaire de Zoologie, has been translated from the original text into foreign languages, and long formed the basis of most minor manuals of zoology published in Europe. His Histoire Naturelle des Crustacés (1834-40) and Histoire Naturelle des Corallinaires (1857-60) were almost equally noteworthy. The Lectures on the
Physiology and Comparative Anatomy of Man and the Animals (14 vols, 1857-81) have a great permanent value for their immense mass of details, and copious references to scattered sources of information. He had an importunate share in a splendid quarto of Anatomical and Zoological Researches on the Coasts of Sicily. Other works were researches on the natural history of the French coasts (1832-43) and on the natural history of the mannaqlis (1871). In some of his later works he was assisted by his distinguished son Alphonse. Milne-Edwards must always hold high rank amongst the naturalists of the 19th century. His researches in the distribution of the lower invertebrates led him to the theory of centres of creation; he adhered throughout life, in spite of the general acceptance of the newer and larger views of Darwin by his fellow-scientists. He died on the 29th July 1885. His elder brother, Frederick William, was almost equally celebrated. He founded the Ethnological Society in Paris, and is considered the father of ethnology in France.

Milton, Joseph, an ecclesiastical historian, was born near Chichester, in 1858. He studied at Catharine Hall, Cambridge, and afterwards became well known as head-master of Hall grammar-school. He was vicar of North Ferriby, 7 miles from Hull, and lecturer in the principal church of the town. He died in 1877 from rupture of Holy Trinity Church. He died on 15th November of that year. Milner's principal work is his History of the Church of Christ, of which he lived to complete three volumes, reaching to the 13th century; a fourth volume coming down to the 16th century, was edited from his MSS by his younger brother, Dr Isaac Milner, dean of Carlisle, who also published a complete edition of his brother's works in 8 vols, 1810. The principles on which the history is written are of the narrowest kind; the scholarship, literary style, and critical insight are alike poor.

Milton, John, after Shakespeare the greatest English poet, was born in Bread Street, Cheapside, on December 9, 1608. His father, John Milton, was a prosperous scrivener, a Puritan but a resister, and for several pieces much admired by his contemporaries. He was the son of a family of yeomen settled in Oxfordshire, and had come to town upon being disinherited for his religious convictions by his father, a Catholic recusant. He appears to have from the first been disposed to turn to literature, and was determined to give himself the best education he could. After studying under private tutors, young Milton was admitted about 1620 into St Paul's School, where he distinguished himself not only as a scholar, but as a poet. In February 1625 he entered Christ's College, Cambridge, where his historical course was not wholly smooth; he seems to have been chastised—not, as the legend says, flogged—by his tutor, and was certainly rusticated for a short time in 1626. After his return, however, he went through the university course with credit, graduating as Bachelor at the proper time, and proceeding Master of Arts in July 1632. The condition of the church, over which Land then ruled supreme, deterred the young Puritan from taking orders; he felt no vocation towards any other profession; and, left without a means of supporting himself, he married the fortune he had acquired in business, he settled quietly down with the distinct purpose of making himself a poet by study and self-discipline. His poetical genius had already been attested by two noble productions, the ‘Hymn to the Nativity,’ and ‘Al a Sikel, in Honour of Music,’ as well as much Latin verse of the highest quality; but it is remarkable how little stimulus he seems to have felt to occasional composition. During his six years' residence at Horton he produced, so far as known, only two English poems of importance which can be ascribed to direct poetical impulse from within, the Allegro and the Penserone. Comus was written at the instance of his friend, the musician Henry Lawes, to celebrate Lord Bridgewater's assumption of the stewardship of the Welsh manor. It was performed at Ludlow before a select assemblage in September 1634. Lycidas was evoked by the death of his friend, Edward King, shipwrecked on his passage to Ireland in 1637. There is, perhaps, not another instance in literature of a great poet so completely dependent on external inspiration, and, while meditating the highest things, so content to hide his time in calm reliance upon his ability to do what he pleased when he pleased. The four productions of this Horton period were indeed of themselves not sufficient to place him in the first rank of English poets. Their most individual characteristic is perhaps chasterene exuberance—boundless poetical wealth severely controlled, and splendidly displayed without lavish-
Milton's visit to Italy is one of the most memorable chapters of his life. He was cordially received by the Italian literati, especially at Florence, where he made not only pleasant acquaintance, but permanent friendships. At Rome, notwithstanding his undaunted profession of Protestantism, he was treated with especial attention, and at Naples the venerable Marquis Manzo, half a century earlier the protector of Tasso, gave him hospitality and presents, which Milton requited with an elegant Latin poem. The impression which Milton thus produced upon foreigners is a proof of something imposing and attractive in his style. His skill in the Latin language was already of course a sealed book to the Italians. His journey home was hastened by news of the outbreak of hostilities between Charles I. and the Scots, and his return was saddened by tidings of the death of his friend Diodati, whom he celebrated in later life in one of the finest Latin elegies of the time. The list of his Latin poems. He settled in St. Bride's Churchyard, afterwards in Aldersgate Street, and devoted himself to the education of his widowed sister's children, the two young Phillips. Unconcerned of the long farewell he was about to bid to poetry, he occupied himself leisurely in the careful polishing of his Latin poems. The conception of Paradise Lost as a mystery or miracle play gradually dawned upon his mind, and Satan's address to the Sun was actually written about this time. But the Civil War came, and for long silenced Milton's muse, except for an occasional sonnet.

It has been much debated whether the world has lost or gained more by Milton's absorption in politics. His religious zeal is somewhat like; to wish for Milton other than he was is to wish for a succession of Comus rather than a Paradise Lost. No man capable of conceiving such a work as Milton's epic could be unaffected by the situation of his country at that tremendous crisis, and with Martin Powell's allowing that 'the greatest part of anything signified total occupation by it for the time. The tracts which he now poured forth are as truly lyrical inspirations as any of his poems; by no mean masterpieces of reasoning, but didhyrambic casquettes of love or hate. Three appeared in 1641, two in 1642. All five relate to church government, never was diatribe so magnificent called forth by a theme so unpromising. In fact, however, the writer's thoughts are much higher and deeper than his subject, and, stripped of what is temporary and accidental, the latter, that appear magnificent idealisations of the possibilities of a long future, which to Milton seemed ever at the door. The great drawback to their enjoyment at the present day is the scrappiness of their invective, which passed comparatively unreceived amid the events of the revolution.

In 1643 Milton's activity as a public writer was diverted into a new channel by private affairs which, however, he so handled as to render of universal concern. In June of this year, after a very short courtship, he married a young lady, Mary Powell, daughter of an Oxfordshire squire, previously known to him as a debtor to his father for money advanced on mortgage. The bride's family were puritans, and she would seem to have been as little suited to her husband in every other respect as by her education and connections. The idealising imagination of the poet must in all probability have been at work, and the thoughtless precipitancy of the whole transaction would alone cause her how long and how bitterly she was to regret her marriage. The estimate of Milton's character needs revision. The poor girl was naturally shocked at the sudden transfer from a jovial country household to the apartments of an austere scholar, whose intellect and philosophical vagaries were utterly unable to appreciate, and whose principles remained completely alien. After a few weeks' trial of marriage she walked away with her husband, under a promise, Milton's nephew says, to return at Michaelmas; but doubt is cast upon this statement by the fact, discovered by Professor Mason, that Milton's first tract on divorce was written and printed at the very time of the separation. She certainly did not return, and early in the following year Milton put forth another edition of his Doctrine and Discipline of Divorce, greatly extended, and enriched with erudition and illustration, and containing many passages of a satirical cast, mainly from the Presbyterians, from whose views on church and state he had been more and more dissociating himself. He replied to his opponents in three supplementary pamphlets, and a threat of prosecution by a parliamentary committee, which never came to nothing. Milton's contributions (October 23, 1644) to The Doctrine and Discipline of Divorce, have been further stimulated by the overthrow of the Royalist cause, which had occasioned the total ruin of her family. Concessions, probably, of his own failings in temper and considerateness, Milton did not prove obdurate; and by September his household was re-established in the Hackney. She further induced him to receive her mother and other members of her impoverished family, persons whom he had little reason to love, and of whose incompatibility he complains in a letter to an Italian friend. Little else is said of her, except that she brought him his three daughters; she died in 1652. He lost the father to whom he owed so much in 1647, a year after the fruits of his education and the partial accomplishment of the purpose of his life had been manifested in a collected edition of his poems, and the schoolmaster of his boyhood, Thomas Powel, had been buried.
defence of the deed, The Tenure of Kings and Magistrates. Having thus definitively est in his lot with the ruling party, he was appointed on March 15 to a post which no other man in England was fit to fill. His position of eminence, and the dignity of his country seems to have been admitted from the first, though in the absence of reviews his fame travelled slowly. The year 1671 witnessed the publication of Paradise Regained, probably written in 1665-66, and of Samson Agonistes, written later still. Milton's formidable purpose was not to make himself known: the Quaker Ellwood, working on the suspicion Milton could not but entertain that he had after all made Satan the hero of Paradise Lost, Samson Agonistes, dramatic in form, is lyrical in substance, a splendid lament over the author's forlorn old age, and the apathy, as he deemed it, of his nation. Both pieces evince the continued tendency of his style towards simplicity, which sometimes degenerates into baldness. They are noble pendants to Paradise Lost, but the more their relation to this palmary work is studied the more one feels that it and it alone places him among the supreme poets of the world.

Milton's domestic life during this period had not been fortunate. The great cause of sorrow was the undutifulness of his daughters—very ordinary women, living without checking, and for whose performances no one was necessary to provide him with an assistant in his official duties. His domestic life at this period was tranquil, distinguished chiefly by his second marriage and the loss of his wife (1656-58), and the pleasing intimacy of young friends, recorded in his sonnets. The magnificent sonnet on the massacre of the Vaubois was written in 1653. Several controversial pamphlets with Alexander Morsa followed his contest with Salmasius, chiefly remarkable for the durability and dignity of his references to his affliction, and for his flattering portraits of the great men of the Commonwealth, especially Cromwell. Always leaning to the more radical side, he had supported Cromwell in all his extra-legal measures, though the disappointment of his early republican ideal must have cost him many pangs. He retained his secretaryship until the abdication of Richard Cromwell, when the condition of public affairs again made him a pamphleteer. His writings of this period, greatly inferior in splendour of diction to his first productions of the kind, are still most interesting as passionate protests, conclusive of his whole history, and the different temper and poesy of his essentially poetical temperament. The Restoration drove him into concealment. Few had more bitterly exasperated the Royalist party; but the new government was not bloodthirsty, and about the beginning of 1661 he found himself settled in Jewin Street (afterwards in Artillery Walk, Bunhill Fields), honourably released from politics with the gratifying consciousness of having done his duty and his best, and free to devote himself entirely to the permanent purpose of his life.

Paradise Lost was written during the great fire of 1666, but still above want: executed as a regicide by the majority of his countrymen, but already acclaimed by the discerning as the first poet of his age; worn by attacks of gout, but cheerful and even joyous in the intervals of pain, unfulfilled designs of his youth, written the early history of England and endeavouring to amend men's conceptions of grammar and logic. These writings are indeed of little value; but his Latin Treatise of Christian Doctrines, though devoid of all pretensions to eloquence, is a memorable work. Milton's theocentric, a profound and enthusiastic; the head of that great fire of 1666, but still above want: executed as a regicide by the majority of his countrymen, but already acclaimed by the discerning as the first poet of his age; worn by attacks of gout, but cheerful and even joyous in the intervals of pain, unfulfilled designs of his youth, written the early history of England and endeavouring to amend men's conceptions of grammar and logic. These writings are indeed of little value; but his Latin Treatise of Christian Doctrines, though devoid of all pretensions to eloquence, is a memorable work. Milton's theocentric, a profound and enthusiastic; the head of that
epital treatment, partly to his exceptional qualifications for treating it, but most of all to the actual superiority which his own genius imparts to him. And the Hellenic spirit appears thoroughly at one. His theme and his credit connect him with the Scriptures, but his literary tastes and models are the tastes and models of the Renaissance. As an English poet he fills up the great gap which would otherwise yawn between the age of Shakespeare and the age of Dryden, and, like Wren in architecture, proves that the classical style need not necessarily be synonymous with pedantry or inanity. In the artful harmony of blank verse he surpasses every English poet, though he may not have caught the "wool-notes wild" of Shakespeare and his contemporaries. His magnanimity as a man matched his sublimity as a poet; but he had perhaps more than a usual share of the failings attendant upon the magnanimous character, and at first sight appears arrogant and unamiable.

It is not until we consider that the circumstances of his life are not characteristics which are usually admitted by that the biographers have too commonly thought the softer and more familiar traits unworthy of record; until we remember that the company of this austere idelist was frequented by the young, and that the pleasures of the social hour have been exclusively supplied by him; above all, until we note his almost entire dependence for composition upon external impulse, the rashness of some of his actions and the chivalry of others, that we perceive him to have possessed his full share of the emotional temperament common to poets.

The principal contemporary authority for Milton's life is his nephew, Edward Phillips. To this has added some interesting notices, Symmons, Mifford, Todd, and others worthily usefully in their day in collecting and investigating particulars, but their labors have been entirely superseded by Professor Mason (6 vols. 1876-79), who has left nothing unexplored, and whose verdict is in most cases decisive. Johnson's short biography, however, must always answer, as Johnson mightily remark, the instance of insuperable antipathy striving to be just. Milton's Life has been written on a small scale by Mark Pattison ('Men of Letters,' 1880) and by Richard Garnett (1888, with full bibliography). There is an excellent and comprehensive German biography by Alfred Stern (2 vols. Leip. 1877-79). Addison, Johnson, Channing, and Macaulay are especially distinguished among Milton's critics.

MILLVILLE, a city of New Jersey, on the Maurice River, 41 miles by rail S. by E. of Philadelphia. It has manufactures of cottons and glass. Pop. (1890) 10,062; (1900) 10,583.

MILWAUKEE, county seat of Milwaukee county, Wisconsin, and the largest city in the state, is beautifully situated on the west shore of Lake Michigan, 83 miles north of Chicago. It stands at the mouth of the Milwaukee River, which, with its confluent and a number of channels, furnishes 25 miles of dockage. The eastern division of the city occupies high bluffs along the shore of Milwaukee Bay, an arm of Lake Michigan having a width of seven miles separating and constituting a barrier of refuge for the largest lake vessels. Milwaukee's residence streets are wide and well shaded, and her residences comprise many palatial homes. The public parks, eight in number, have an aggregate area of 876 acres (of street width). There are 182 streets embracing sixteen electric lines with 158 miles of track, and also provides the city with electric light. It is connected with an electric line running to Waukesha, twenty miles westward, and another to Kenosha, thirty-five miles southward, to be eventually extended to Chicago. The water supply is drawn from Lake Michigan through a tunnel and a series of aqueducts and spreaders, the whole, however, not very disturbed water. The city is well drained by an extensive sewerage system, and Milwaukee River is flushed with lake water forced into it two miles from its mouth, through a tunnel, by a screw-wheel pump having a capacity of 450,000,000 gallons per day.

Milwaukee's federal government buildings include: The National Soldiers' Home, 20 asylums and lunenomary establishments, 11 hospitals, 3 convents and a Capuchin monastery, 152 churches, 51 parochial schools with about 20,000 pupils, 52 public schools with an aggregate enrolment of 34,000 pupils, a public library containing 50,000 volumes, a public museum, an art gallery, 11 banks, including five national banks, and life and fire insurance companies.

Eight daily newspapers are published here, and there are many weeklies printed in various languages. Milwaukee is essentially a manufacturing city, although the grain and lake shipping interests are quite large. Besides the lake lines which provide connections for the trunk railroads, there are eleven lines of passenger and freight steamers running to various ports on the lake, and a car ferry plying across Lake Michigan. Eleven railroad lines are connected with the city from the eastern states.

The coal received during the same year amounted to 1,492,000 tons. The value of Milwaukee's manufactured products during 1890 was $126,676,112, including $30,467,283 in the metal-working industries, $13,797,250 in brewery products, and $13,419,233 in the leather-working industries. Beer brewing is the largest industry, the output in 1897 aggregating 2,271,448 barrels. Population of the city (1890) 204,465; (1900) 285,315.

Miînas (from the Sanskrit mîna, 'to investigate;' hence, literally, investigation) is the collective name of two of the six divisions of the Vedanta, the Hindu philosophy. It is distinguished as Pûrvî and Uttara-mînâs, the latter being more commonly called Vedânta, while the former is briefly styled Mînâs. Though the Mînâs is ranked, with the ancient writers, with the five other philosophies, the present system is remanent, and the name is applied to it in the same sense as to them; its object is merely to lay down a correct interpretation of such Vedic passages as refer to the Brahmanic ritual, to solve doubts wherever they may exist on matters concerning sacrificial acts, and to establish any nomothetic grounds—according to the Mînâs, always apparent only—of Vedic texts. See Sanskrit, Vedas.

Mînes, the name given by the ancients to certain dramatic performances, in which, with little attempt at art, scenes of actual life were represented, sometimes in improvised dialogue. The Greek names appear to have been invented by the Greeks of Sicily and Southern Italy. They were a favourite amusement of convivial parties, the guests themselves being generally the performers. Sophron of Syracuse (about 420 B.C.) composed many in the Doric dialect, which were much admired, and which Plato was accustomed to read. The Roman names were not borrowed from the Greek, but were of native Italic growth. They were not only far ruder and coarser, but in some respects they were essentially different—the dialogue occupying a smaller place, and mere gesture and mimicry predominating. The human frame, as a theatre, having been dignified, though rough and even indecent, and they were generally relished by all classes; even the patrician Sulla was fond of them. Their most famous mimic poets were Deoclas Laberius and Pub. Syrus.

Ministry, the fact that insects belonging to very different groups often bear an extremely
close superficial resemblance to each other has been known for a long period of time. The names given to various species of British moths are sufficient proofs of this. Such names as Bombylo-
formis, Apiformis, Beuncetformis, &c. imply a recog-
nition of the resemblance between these species and others belonging to an entirely different order. The meaning of such likenesses was, however, unknown until the appearance of H. W. Bates's classical paper in 1892. In this essay the author shows that the species which has departed from the normal type of its group (the mimicker) is far rarer than the form which it resembles, while the latter (the mimicked) is abundant and well defended by some special protection, such as the possession of an unpleasant taste or smell or the power of stinging. Bates's observations were con-
ducted in tropical America, where abundant, con-
spicuous, slow-flying, nasonia butterflies (Heli-
combre and Dainaiide) are closely mimicked by Pterine (the family containing our common garden white butterflies) and other butterflies, and in many cases by day-flying moths. Subsequent observation has confirmed Bates's suggestion. Wallace found numerous instances of mimicry among the Lepi-
doptera of India and the Malay Archipelago, and Trimen directed attention to similar facts among South African butterflies. The latter include the most remarkable instance of mimicry yet discovered. The male of a South African swallow-tailed butterfly (Papilio cenus) is typical in appearance and possesses the characteristic 'tails' on the hind-wings: the female is utterly unlike the male in the colouring and form of the wings, the 'tails' being entirely absent. While the female is so different from the male of its own species it appears in three well-marked varieties mimicking three different species of the nasonia genus Danais—viz. the black brown-spotted D. Echeria, the

black and white D. niaius, and the black reddish-brown and white D. chrysippus (see fig. 2A). In West Africa a closely related swallow-tail (P. mer:ope) has a very similar male, and females mimicking D. chrysippus and the West African form of D. narius. While such remarkable changes have occurred on the mainland of Africa, the an-
cestral form from which these mimetic species have been developed has been preserved comparatively unchanged on the island of Madagascar, as the closely related Papilio meriones in which the female much resembles the male and is non-mimetic. Similar species with sexes almost alike have been found in the Comoro Islands (P. humbolti) and in

* * *

Albusia (P. antinori). This example strongly enforces a conclusion also arrived at by Bates and Wallace—viz. that the females are far more fre-
quently mimetic than the males. Wallace has explained this because of the especial dangers incurred by the female during her slow flight when laden with eggs, and her exposure to attack during oviposition.

The examples selected for illustration were lent by Colonel Swinhoe; the latter was about half the natural size. Fig. 1 represents the male of the Indian and African Hypolimnas misippus; it is non-mimetic and very unlike the female, being distinctly marked with a large iridescent blue spot on each of the four wings. The iridescent spots on the right wings appear to be larger than those on the left, because they are seen at a different angle. The male remains unchanged in the localities where its female alters in correspondence with the form it mimics. Fig. 2 is the commonest form of female, which mimics the above-mentioned Danais chrysippus (fig. 2A), occurring nearly all over the Old World. In Aden and some parts of Africa the latter butterfly is represented by a variety or sub-species with white hind-wings (Danais alecippus); see fig. 3A. In the same region there is a similar variety of the female Hypolimnas (the Dora form), shown in fig. 3. Finally, in Aden and certain African localities there is another variety or sub-
species of the Danais (D. dorippus) without the black and white marks at the tip of the fore-wing, shown in fig. 4A; while the Hypolimnas follows with a similar form of female, seen in fig. 4. This latter is also common in the south-west of India, where it has been stated that the mimicked form (D. dorippus) does not occur. Colonel Swinhoe, however, felt sure that the existence of the mimicker could not be doubted on the evidence of the mimicked species. He tested this hypothesis by examining large numbers of the Danais, and he found that the dorippus form does exist in that part of India, although it is extremely rare; he came across about a dozen in four or five years. It is probable that dorippus has been nearly im-
planted by the dominant form chrysippus, the resemblance between the two being sufficiently close for the mimic of the former to be mistaken for the latter. The case forms a most interesting exception to Bates's third condition.

The butterflies which afford models for mimicry chiefly belong to the two families Danaide (including Euploea, Danais, and Hostia) and Aenidae, in addition to the Heliconidae of tropical America. There is some direct and much indirect evidence to show that all mimicked species are specially pro-
tected by an unpleasant taste or smell. Wallace has concisely stated the conditions under which mimicry occurs, as follows: (1) That the imitative species occur in the same area and occupy the same station as the imitated. (2) That the imitators are always the more defenseless. (3) That the imitators are always less numerous in individuals. (4) That the imitators differ from the bulk of their allies. (5) That the imitation, however minute, is external and visible only, never extending to internal characters with respect to such as do not affect the external appearance.

Examples of mimicry are also well known in other orders of insects. The formidable Iden-
optera (including the hornets, wasps, bees, and ants) are frequently resembled by butterflies: the hornets (Lepidoptera), beetles (Coleoptera), flies (Diptera), &c. The most remarkable example yet described was discovered by W. L. Schletter in tropical America. The leaf-cutting ants (Eccosoma) are extremely abundant in this part of the world, and present a
very characteristic appearance, each homewarm-

unresemblance

Mimicry is, however, by no means

overhead, is generally regarded as a

piece of leaf, which she held in her

turning the piece of

Mimicry is, however, by no means

unknown in other animals. Thus, the gaudy

colours of the deadly coral snakes (Elaps)
of tropical America are mimicked by harmless

snakes; and the powerful frigate-birds are

resembled by defenceless orioles in various

Malayan islands. All the

instances cited above illustrate protective mimicry

— a resemblance which serves to

defend the imitator from attack. But there are

other although far rarer examples of aggressive mimicry, in which the resemblance

bears the attack of the imitator upon the

mimicked species or upon species which accompany

the latter. Thus, the larvae of certain flies (Volu-
cellia) bear a resemblance to the larvae of

humming-bees and wasps. The parent fly resembles the humble-bee or wasp, and is thus less likely to arouse suspicion

when engaged in laying its eggs in or near the nest.

Mimetic appearances are often combined with

other methods of defence; thus, many cater-
pillars are well concealed by protective resemblance, and

only assume the terrifying snake-like appearance

when alarmed. It is of great interest to trace

the relation of mimicry to the other uses of colour

in animals. This relationship is shown in

the above table. The difference between mimicry and

protective resemblance (with which it is often

confused) will be seen when A is compared with B.

The term mimicry has been criticised as seeming

to imply conscious volition on the part of the imitator.

Such a misapprehension is unlikely to arise in

any one who has read the literature of the subject.

Authorities are agreed that the resemblance has

been gradually produced by the operation of the

natural selection which has ensured the persistence of all

variations tending in the direction of some well-

defended insect avoided by foes.

Mimosce, a sub-order of Leguminoseae, distin-

guished by regular flowers and petals valvate in

bud. Over 1500 species are known, all natives of

warm climates, a few only extending beyond sub-
thropical regions in the southern hemisphere. The

genera Acacia (q.v.) and Mimosa are the best

known. To the latter genus belong the

Sensitive Plants (q.v.), also a great

variety of trees

usually of beautiful foliage (though their

leaves, as in Acacias, may be reduced to

phyllodia) and often also of good timber.

The fruits are often esteemed,

but the roots and

seeds not unfre-

quently possesses
dracigraphic or even poisonous

properties. They are also rich in tannin

gums.

genus of plants of the

natural order Scro-

phulariaceae, having

a prismatic 5-toothed
calyx, a somewhat bell-shaped corolla, of which the

Mimulus maculosus—var. Arlequin.
upper lip, is bifid and the lower lip trifid, two long and two short stamens, and a stigma of two lamellae, which close together upon irradiation. The species are mostly herbaceous plants, natives of America. Some of them are very frequent in flower-gardens, and many fine varieties have resulted from cultivation. They sometimes receive the name of Monkey Flowers. One species, M. lutea, is native of Peru and Chili, and there used as a potherb, has become naturalised in many parts of Britain. The little yellow-flowered Musk Plant, now so common in gardens and on window-sills in Britain, is M. moschata, a native of Oregon and other north-western parts of America.

Minna, a Greek weight and money of account, the sixtieth part of a Talent (q.v.), containing 100 Drachmes (q.v.).

Minas Bird. See Myna.

Minars. See Sareans.

Minaret. Minar, a tall turret used in Saracen architecture. It contains a staircase, and is divided into several stories, with balconies from which the muezzins summon the Mohammedans to prayer—bells not being permitted in their religion—and is terminated with a spire or ornamental finial. These are amongst the most beautiful features of Mohammedan architecture, and are an invariable accompaniment of the Mosques (q.v.). For an illustration, see ARABIAN ARCHITECTURE. In India Minars, or pillars of victory, are frequently erected in connection with mosques; some of these are lofty and splendid monuments, that of Kutub, at Old Delhi (q.v.), being 47 feet in diameter at the base and 236 feet high. The form of the minaret was derived from the Pharaohs (q.v.), the ancient lighthouse of Alexandria; and the same is from the Arabic mandarat, 'a lighthouse.'

Minas, capital of a wild, mountainous province (area, 4944 sq. m.; pop. 23,000) of the same name in southern Uruguay, 75 miles by rail NE. of Montevideo. Pop. 7000.

Minas Geraes, the most populous state of Brazil, lies inland from Espirito Santo and south of Bahia, and has an area of 222,160 sq. m. Pop. (1918) 3,019,801. Lying wholly in the tableland, its surface is occupied with grass and bush-covered campos, rising, however, in the Serra do Espinhaco to 5000 feet. The principal rivers include the navigable Sao Francisco and the Rio Grande, which unite with the Parana to form the Parana. Agriculture and stock-raising are the chief industries. Some gold is still obtained, and diamonds, iron, and lead are mined. The inhabitants include very few whites; among the Indians the Botocudos (q.v.) are met with.

Mince-pies, an important item of English Christmas fare, composed of very numerous in- gredients (such as apples, lemons, currants, figs, almonds, flavoured with mace, cloves, ginger, &c.) variously compounded and baked in pastry. Formerly mutton or nett's-tongue was an essential ingredient. The shape of the crust was not originally round, but is said to have been intended to represent the manger in which the Holy Child was laid.

Minc, the channel separating the island of Lewes from the mainland of Scotland. It is 24 to 40 miles wide, and has a rapid current. The Little Minc, separating Skye from North Uist and the three neighbours islands in the Outer Hebrides, is 14 to 20 miles wide, and is navigable.

Minchinchon, a market-town of Clones- tershire, 3½ miles SSE. of Stroud. James Bradley is buried in the churchyard. Pop. of parish, 4561.
to constitute natural groups by having regard to both. Some minerals being of great use, and others highly valued for their beauty, have received much attention from the earliest ages. The ancient naturalists describe few minerals. The first attempt at a classification of them was by Agrippa in the 16th century. The systems of the Swedes Wallerius and Cronstedt, in the later half of the 18th century, were the first worthy of the name. That of Werner followed, and was extensively adopted. The discoveries of Hauy in crystallography and the loss of chemical knowledges have not, however, created a new character; and then sprang up two schools of mineralogists, one resting chiefly on external characters, and the other on chemical composition.

The chemical classification of minerals is rendered difficult by the endless variety of combination and proportion in the elements of which they are composed, the presence of substances not essential to the mineral, and yet more or less affecting its character, and the frequent impossibility of determining what is to be deemed essential and what accidental. Chemical purity is almost never found in nature. Even the purest diamond, when burned, leaves some traces of ash; and the various colours of diamond, quartz, and other minerals are due to the presence of substances which are often in such small proportion as to affect the arrangement of the forms or other physical properties. Again, some minerals of identical chemical composition differ in their crystallisation, so that an arrangement founded upon it would separate them too widely. There are also many minerals which are often found in mineralogical or artistic varieties, which are always so. In the arrangement of minerals into natural groups, their chemical composition, although not alone to be regarded, is of the first importance, so that the place of a new mineral in the system can never be determined without analysis; and in determining the nature of a mineral chemical tests, such as the application of acids, are continually resorted to. It is also necessary to know its specific gravity, and how it is acted upon both by a moderate heat and by the blowpipe. An examination of the crystalline forms, with the arrangement of the angles of the crystals, is often sufficient to distinguish minerals which have otherwise much resemblance.

The cleavage of crystals is also important—a readiness to split in planes parallel to certain of their faces only, by which the primitive form of the crystal may be ascertained.

Mineralogical crystals exhibit important varieties of structure, as laminated, fibrous, granular, &c. Certain peculiarities of form are also frequently characteristic of uncrystallised minerals, as mamillary, botryoidal, &c. Minerals exhibit, when broken, very different kinds of fracture, as even, conchoidal, splintery, and others which have a tendency to cleavage. These properties, and transparency are more or less characteristic of different kinds; electric and magnetic properties demand attention; and very important characters are derived from lustre, which in some minerals is metallic, in others semi-metallic, in others pearly, vitreous, &c. Colour is not generally of much importance, but in some minerals it is very characteristic. The colour of the powdered form when a mineral is scratched often differs from that of the solid mass. This is the streak of the mineral, and is very characteristic. Hardness and tenacity are very important, and are different in all various degrees. Unevenness and other peculiarities to be ascertained by the touch are very characteristic of some minerals, and peculiarities of taste and smell belong to others.

Mineralogists have very important relations with geology, which cannot be studied without regard to the mineral constituents of rocks. The mineral composition of soils greatly affects vegetation and agriculture. The economical uses of minerals are also very important and various. It is enough merely to allude to salt, sulphur, borax, alum, graphite, eryolite, native metals, metallic ores, &c. Minerals are also used as fuels in melting, alloying, or in other processes, to a great extent; and they are of well-known utility: and a high value has always been attached to gems and other ornamental stones. There are special handbooks by Bauernh, Dana, Wöhler, Brüll, and Erni. See GEOLOGY, CRYSTALLOGRAPHY.

Mineral Oil. See BAKE, NAPHTHA, PARAFFIN, PETROLEUM.

Mineral Waters, or Hatchettine, a remarkable saline water found in several places in Britain, Germany, Siberia, &c., and soft and flexible, yellowish white, yellow, or greenish yellow, resembling wax or tallow, often flaky like spermaceti, inodorous, melting at 115° to 170° F., and composed of about 86 per cent. carbon and 14 per cent. hydrogen. The mineral is chiefly employed related to the same with ozokerite or native paraffin. Like other hydrocarbons, such as naphtha, petroleum, asphalt, &c., Hatchettine appears to have resulted from the chemical alteration of organic matter.

Mineral Waters, spring waters which possess qualities in relation to the animal body different from those of mineral waters, and which are employed as remedial agents from a very early period. The oldest Greek physicians had great faith in their curative power, and the temples erected to Asen- lapus were usually in close proximity to mineral springs; the warm baths of Calirhoe, near the Dead Sea, being the best known. The Romans also have been tried by Herod in his sickness. We are indebted to the Romans for the discovery not only of the mineral thermal springs in Italy, but of some of the most important in other parts of Europe, amongst which may be named Aix-la-Chapelle, Baden-Baden, Bath, Spa in Belgium, and many others; and Pliny (Natural History) mentions a very large number of mineral springs in almost all parts of Europe (see BATH, HYDROPATHY). The therapeutic action of mineral waters or spas depends chiefly upon their chemical composition and their power of affecting other circumstances, as situation, elevation, climate, geological formation, mean temperature, &c., and have an important bearing upon the success of the treatment.

The best time for undergoing a course of mineral waters is, in the majority of cases, the months of June, July, and August, and frequently depending upon climate; for example, at Gastein, celebrated for its thermal springs, the weather is changeable and stormy in June and July, but pleasant in May, August, and September. Early rising is usually advisable during a course of mineral water treatment, as a general rule, the water should be drunk before breakfast, at intervals of about a quarter of an hour between each muller, moderate exercise being taken in the intervals. In many cases bathing is of even greater importance as a result against the drinking. Baths are generally taken between breakfast and dinner, and should never be taken soon after a full meal. The time during which the patient should remain in the bath varies very much at different spas, and the directions of the local physicians should be heeded. As a general rule, the treatment should not be protracted beyond the space of six weeks or two months, but on this point the patient must be solely guided by the physician resident at the spa. Indulgence in the pleasures of the table, and the use of wine of any kind, frequently counteract the salutary effects of the waters, while perfect mental
RELAXATION IS AN IMPORTANT AUXILIARY TO THE TREATMENT. EXCEPT IN A FEW CASES, SODA IS ONLY SUITABLE FOR PATIENTS SUFFERING FROM CHRONIC DISORDERS.

No classification of mineral waters based upon their chemical composition can be strictly exact, because many springs are, as it were, intermediate between tolerably well characterised groups. The follo\-wing, however, are, although not always, perhaps the most convenient: (1) Alkaline Waters; (2) Bitter Waters; (3) Muriated Waters; (4) Earthy Waters; (5) Indifferent Thermal Waters; (6) Chalybeates; (7) Sulphurous Waters.

Waters employed chiefly for chronic diseases are divided into (a) Simple Alkaline Acidulous Waters, of which the chief contents are carbonic acid and bicarbonate of soda. The most important spas of this class are the thermal springs of Vichy and the cold springs of Fachiingen, Gelman, and Bilin. These waters are useful in certain forms of indigestion, in jaundice arising from catarrh of the hepatic ducts, in gallstones, in renal calculi and gravel, in gout, in chronic catarrh of the respiratory organs, and in abdominal plethora. Vichy (q.v.) may be taken as the representative of this class of springs. (b) Muriated Waters, in which the chief contents are sulphate and bicarbonate of soda. The most important spas of this class are the thermal springs of Carlsbad and the cold springs of Marienbad, serviceable to patients suffering from abdominal plethora, if unconnected with diseases of the heart or lungs. These waters, especially those of Carlsbad, afford an excellent remedy for the habitual constipation in which so frequently arises from sedentary occupations.

The chief contents of the Bitter Waters are the sulphates of magnesia and soda, and the best-known spas of this class are those of Sedlitz, Friedr��chshall, and Kissingen; although two varieties are employed. The hot waters of Cholulare, BitterHH, and Cheltenham, which are cold. The muriated saline springs of Saratoga in the United States are some of them chalybeate, others sulphurous or iodious; all of them being rich in carbonic acid gas. The Balzani saline spring near Saratoga has a very high reputation. The chief contents of the Bitter Waters, which are chiefly employed in cases of gout, rheumatism, scrofula, and abdominal plethora. (b) Muriated Lithia Waters, of which the chief contents are the chlorides of soda and lithium. In gout they frequently ease the pain, but then give relief; and in periodic headache they have been found serviceable. (c) Brines, whose chief contents are a large amount of chloride of soda, such as the sp\-\ns of Recluse in Westphalia and Neunheim in Hesse. They are mostly employed for bathing, and are often of much service in scrofula, anemia, rheumatic, certain forms of paralysis, and catarrh of the mucous membranes. (d) Photo-bromated Muri-
Minerva, the name of a Roman goddess, identified by the later Greeks as Minerva with the Greek Athena (q.v.). Her name is thought to spring from the same root, as mens (’mind’); and the ancient Latin scholar and critic, Varro, regarded her as the impersonation of divine thought — the place where the universals of which the psyche was the creator and Jano the representative. Hence all that goes on among men, all that constitutes the development of human destiny — itself but the expression of the divine idea or intention — is under her care. She is the patroness of arts and trades, and was invoked alike by poets, painters, teachers, physicians, and all kinds of craftsmen. She also guides heroes in war; and, in fact, every wise idea, every bold act, and every useful design owes something to the high inspiration of this virgin goddess. Her chief temple was at Rome, where is the Lateran, but she had another on the Aventine. Her festival was held in March, and lasted five days, from the 19th to the 23d inclusive.

Minerva-press, the name of a printing-office in Leadenhall Street, London, from which issued in the later part of the 18th and the earlier part of the 19th century a long series of highly sentimentally marked novels and a number of miscellaneous periodicals, and an ample measure of tribulation and tears before the happy denouement was reached. These were gradually laughed out of existence as a taste for more humane and healthful fiction spread over England.

Minervino, an agricultural town of Southern Italy, 41 miles W. of Bari. Top. 14,372.

Mines, Military, are underground passages by means of which explosives are lodged in such a position as to destroy the enemy’s works or to gain cover for lodgments from which the besieger may continue his advance. They are generally but a few feet below the surface, never driven through rock for any distance, and require lining with wooden cases.

With the invention of gunpowder, mines were constantly used to effect an entrance into a besieged place or to breach its walls by undermining them with timber, which was then set on fire. By means of them Alexander the Great breached the walls of Gaza. Caesar found the Gauls skilled in their use, and could easily make a breach of the enemy’s works. Powder mines began to be largely used early in the 16th century. At the siege of Paphia in 1569 the breaches were ruined and the mines exploded under the feet of the storming parties. General Wolfe, too, behind the walls of Quebec, some 16 feet thick, and then long galleries from them under the ditch with transversals and listeners were added to the permanent fortifications of the 17th century. These enabled the besieged to ascertain the direction of the besiegers mining approach and to destroy their galleries by charges laid near them. The breach at the siege of Candia by the Turks, which lasted two years and a half (1667—69), more than 1300 mines were exploded by one side or the other. Systems of countermines became very elaborate during the 18th century, radiating from the salients some 200 yards; but was reserved for a single front in some cases amounted to 3 miles or more. Modern systems are perhaps less elaborate, but their importance is fully recognized.

When the besieger can no longer advance by surface approaches he has recourse to mining, sinking a vertical shaft (4 × 2’ inside measurement) or an inclined one (3½ × 2’ or 2½ × 2’) generally from the third parallel, and from it working his way forwards. Branch-galleries (3½ × 2’) are broken out wherever necessary, and specially constructed frances filled throughout as the work progresses. In such a confined space only very small tools can be used and the work can be done, as a rule, only by a man, from the head of the mine or gallery. The basic units of a method of mining is to make a breach in the feint, and then to get underneath it and eventually blow it up. The method is to carry out a tunnel which is worked forward in opposition to the enemy’s line of advance, or as a tunnel which is worked towards the enemy in a direction parallel with his line of advance. The nearest of these is to make a breach in the feint, and then to get underneath it and eventually blow it up. The method is to carry out a tunnel which is worked forward in opposition to the enemy’s line of advance, or as a tunnel which is worked towards the enemy in a direction parallel with his line of advance. The nearest of these is to make a breach in the feint, and then to get underneath it and eventually blow it up.

Somewhat akin to these latter are the ground torpedoes placed in front of the enemy’s line of advance, the earthworks and much other work. In this manner the besieger attempts to open a pathway for his troops to gain the enemy’s works. In this manner the besieger attempts to open a pathway for his troops to gain the enemy’s works. In this manner the besieger attempts to open a pathway for his troops to gain the enemy’s works.
platform on which rough stones, bricks, or shells are placed. On being fired these are projected forward and cover a large surface of the ground in front. Eighty pounds of powder would throw 5 tons of bricks and stones over a space 160 yards long and 120 broad. A shell fossgas is simply a box buried in the ground, the lower part filled with powder. The deflagration with this shell is generally self-exploding, like the ground torpedo.

Submarine mines are charges of explosive material (usually gun-cotton or dynamite) sunk in rivers, estuaries, or roadsteads to prevent the passage of hostile vessels. These mines either obstruction mines, fired by electricity from an observation station; controlled electro-contact mines, fired by the defender when a vessel striking them gives notice of its being over them; uncontrolled mines, mechanical, electro-mechanical, or chemical, which are exploded when struck with adequate force by friend or foe; or dormant mines, which, sunk at first, can at any time be caused to rise and obstruct the passage.

Submarine mines are usually placed chequerwise in several rows and groups and often at varying depths depending on the reliability of the weapon at greater distances than one sea mile in foggy weather, and at night must be watched by electric search-lights. With contact mines there is the danger of friendly ships mistaking the channel. All mine fields must be defended by heavy guns placed at intervals; so that if the minelayer fails, otherwise the enemy's boats will creep for the mines or clear a passage through them by exploding countermines. It is so difficult to arrange a system of mines which will not interfere with the passage of friendly vessels, and was much in use in the Crimean War. by preventing that of an enemy's vessels at all times and in all weathers, however disguised, that they are only objectionable when used for the absolute closing of comparatively narrow channels to all traffic.

Some sea-boats have torpedo passages from which Whitehead fish torpedoes and similar projectiles can be discharged; but these can hardly be classed as submarine mines.

**Minghetti, Marco**, Cavour's most distinguished disciple and successor as leader of the Italian Right, was born 8th September 1818 of a count family. He entered the legal profession and received his brilliant course at its university by a prolonged tour in France, Germany, and Great Britain. Free trade as vindicated by Richard Cobden he prepared himself for its acceptance, by familiarity with the teaching of Malthus. At the head of the House of Representatives he was the champion of the 'Consulta della Finanza' and minister of Public Works. But under the pressure of Austria, backed by Radesky's forces, the pope's reforming zeal was short-lived, and Minghetti, like others of his school, abjured the papal government and enrolled in the Sardinian army to fight for his country's cause under King Charles Albert. He served with distinction in the Lombard campaign; was promoted captain, then major; and on the field of Custozza earned the cross of the Knights of St Maurizio. After the defeat at Novara he retired to Turin, an ardent student of economics and devoted friend of Cavour, whose confidences he shared during the diplomatic meetings at Paris which preceded the Crimean war, the war of 1859, and the expulsion of Austria from Lombardy. In the event of the 1859 defeat at Solferino he set out for foreign affairs, till he resigned with his chief over the treaty of Villafranca. His next post was that of minister of the Interior, and he resigned on the death of Pius IX in June 1871 he was regarded as his ablest representative in the Italian chamber. In 1863 he became prime-minister, in 1864 he concluded with the Emperor Napoleon the 'September Convention.' In 1865 he was Italian minister in London, and thereupon he formed the government. The collapse of the Second Empire brought with it the dissolution of the September Convention, and Rome became the capital of Italy and seat of government. From 1873 to 1875 Minghetti was prime-minister of the second of the united states. His far-sighted political measures earned his country's gratitude by effecting the 'paraggio' or financial equilibrium between her outlay and income. For the next ten years Minghetti was still the most prominent member of the Italian parliament. His lectures and essays on Raphael and Dante illustrate in the aesthetic side a catholicity of culture which in the sphere of practical politics can point to his treatises on Economia Pubblica (1859) and La Chiesa e lo Stato (1878).

He died in Rome, 10th December 1886. See his *Miei Ricordi* (Turin, 1888).

**Mingrelia**. See *Georgia, Caucausus*.

**Minho** (Span. Miño, anc. Minias), a river of Spain and Portugal, rises in the north-east of Galicia, flows south-west through the Spanish provinces of Lugo and Orense, and, after passing the boundary between Portugal and Spain, falls into the Atlantic Ocean. Its total length is 174 miles, and it is navigable for small craft 25 miles above its mouth; a bar at the entrance prevents the passage of large vessels. Area of basin, 107,000 sq.m. The chief tributary is the Sil, which joins it from the left.

**Miniature-painting**, or the painting of portraits on a small scale, originated in the practice of embellishing manuscript books (see ILLUMINATION OF MANUSCRIPTS). As the initial letters were written with red lead (Lat. minium), the art of illumination was expressed by the Low Latin verb miniare, and the term miniature was applied to the small pictures introduced. After the invention of printing and engraving this delicate art entered on a new phase; copies in small dimensions of celebrated pictures came to be in considerable request, and the demand for miniature-portraits that a miniature in popular language came to signify 'a very small portrait.' Soon after their introduction miniature-portraits were executed with very great skill in England. Hogarth (1697-1764) was the greatest exponent of miniature-paintings, and having settled in London, his works had great influence in calling forth native talent. The works of Nicholas Hilliard (born at Exeter 1547, died 1619) are justly held in high estimation. Isaac Oliver (1556-1617) was employed by Queen Elizabeth as designer of the sovereign's emblems and badges, and from 1601 to 1617, executed many portraits, being chiefly concerned with the portraits of the court. His portrait of his uncle, John Hoskins, an artist of reputation (died 1664), carried miniature-painting to high excellence. Cromwell and Milton sat to him; he was employed by Charles II., and obtained the dignity of Pope Innocent XI. He was also employed by Louis XIV. of France and in Holland. Jean Petitot (1607-91) was the first to bring to perfection the art of enamelling as applied to portraiture. There are as many as fifty-eight examples of this great artist in the Jones Collection at the South Kensington Museum. Richard Cosway (1742-1821) was one of the most famous miniaturists of the 18th century.
Robert Thorburn (1818–85) first made his name as a miniaturist, and many others might be mentioned. In his lifetime, numerous miniatures were done by Sir William Ross (1794–1860), who lived to see his art superseded by photography. The number of his miniatures in existence is said to number over 2,000. Of late years public interest in the work of the miniaturist has revived, and several exhibition has been held in historical exhibitions. Prices have advanced, and it is extremely difficult to obtain good examples. The works of Cosway are especially sought after. Photography may be said to have killed the art, although miniatures have continued to be painted; but enthusiasts hope from the interest now taken in historical miniatures, that the art may yet be revived. As to technical details, the early artists painted on vellum and used body-colours—i.e. colours mixed with white or other opaque pigments, and this practice was continued till a comparatively late period, when thin leaves of ivory fixed on card-board with gum were substituted. Many of the old miniatures worked with oil-colours on small plates of copper or silver. After ivory was substituted for vellum transparent colours were employed on faces, hands, and other delicate portions of the picture. Body-colours were used for draperies and the like; but during the 19th century, in which the art has been brought to the highest excellence, the practice has tended to execute the entire work except the highest lights in white drapery with transparent colours.

Foster, British Miniature Painters and their Work (1889); Russell, Art of Miniature (4th ed. 1878); Wagner, Miniature Painting (Philadelphia, 1876); Foster, Some Miniature Painters, in Antiquities (vol. sili., 4v.); W. Bradley, Dictionary of Miniaturists (3 vols. 1888–89); and J. L. Probert, History of Miniature Art (1891).

MINIÉ

Claude Etienne, inventor of the Minié rifle, was born in Paris in 1814, enlisted in the army as a private soldier, and quitted it as colonel in 1858. He devoted his principal thought to the perfecting of firearms, and in 1849 invented the Minié rifle (see Rifles). In 1858 the khedive of Egypt appointed him director of a small-arms factory and musketry school in Cairo. He died in 1879.

Minié (Frates Miniés, “Little Brethren” — so named from the still greater liability, by contrast with the Frates Minores or Lesser Brethren of St. Francis of Assisi), an order of the Roman Catholic Church, founded by another St. Francis, a native of Paula, a small town of Calabria, about the middle of the 15th century. See Francesco di Paula.

MINING

The art of mining comprehends all the processes whereby the useful minerals are obtained from their natural localities beneath the surface of the earth, and the subsequent operations by which many of them must be prepared for the purposes of the metallurgist. Mining has been practised from the remotest times. It is referred to in the 28th chapter of the Book of Job; and an Egyptian papyrus, drawn in 1400 B.C., preserved in the museum at Turin, depicts the workings of a gold-mine. The first writer who treated mining in a systematic manner was Theodosius of Bithynia, who lived about 1556 B.C. He published in Latin an exhaustive treatise on the subject. The introduction of gunpowder as a blasting agent in 1629 completely changed the conditions under which mining had to be done, and the enlarged scale on which mining operations were carried on, led to the invention of new methods of working, and to the introduction of machines of greater precision and power.

All mineral deposits are divided into two very broad divisions. The first includes the beds or seams of iron ore, coal, and salt. These are usually called ores or metaliferous deposits. The second class includes mineral veins or lodes (see Ore-Deposits). Various names have been given to these deposits. In the British colonies, for example, they are termed reefs (see Gold), and somewhat misleading names. A lode may be defined as a repository of mineral matter which fills more or less completely a former fissure in the earth’s surface.

The mining appliances employed are very different in the two classes of deposits. In the first class, it is desirable to make a hole of the smallest possible depth from the surface of the ground to the bed of mineral. A shaft is therefore sunk through valueless beds until the mineral is reached. Machinery of the best class is then used to extract the whole of the mineral, due precautions being taken to avoid danger from falls of 800 feet or from poisonous gases. In the second class of deposits, the inclination of the mineral vein has to be taken into account, as the deposit varies considerably in inclination and in size. The vein must therefore be studied foot by foot, downwards from the top, and the value of the minerals in the vein ascertained. Certainly in most cases it would appear that the chance of vertical lodes being productive is much less than in inclined ones. In some cases a vertical shaft is sunk, and passages, known as cross-cuts, are driven from this to the vein at different levels.

A vertical shaft presents the advantages of greater ease in sinking, hauling, and pumping. At the Comstock lode, in Nevada, thousands of pounds were wasted in sinking a perpendicular shaft, the advantages of which were negatized by the considerableplasticity. A deep shaft may cost from £10,000 to £50,000. In the case of an inclined shaft the ore obtained from the shaft itself enables some of the charges to be recouped. In a well-known Cornish copper-mine, Tresvean, after an inclined shaft had been used for many years, a new shaft of 800 feet in depth, was sunk at a cost of £20,000; but success had already been assured before this great outlay was contemplated. The best arrangement for an extensive mine is to have a main vertical shaft and several secondary inclined ones. With inclined shafts it is one of the questions to put in the finely-perfected engines used at collieries, the object being not the removal as quickly as possible of large quantities of material, but the exploration of the vein by slow and careful degrees at many points and with a moderate number of men.

In searching or prospecting for mineral deposits large sums of money are spent, sometimes in vain. The surface of the rock is usually covered by deposits of sand and gravel, vegetable matter, vegetation, and, in some cases, peat bogs. In consequence, many notable mines have been discovered where they could not have been found if left in their natural state. Gold may be picked up by birds, led to the discovery of veins of gold ore in Lower Hungary. The famous silver-mines of Potosi are said to have been discovered by an Indian who, taking hold of a bush to prevent his falling, pulled it up by the roots and saw gold in the soil. Again, gold was discovered in California by James W. Marshall, in 1848, while cutting a small mill-race. In ancient times the search for mineral deposits was based on the indications given by the Divining-rod (q.v.); and there still exist in certain regions of the United States diviners who pretend to be able to discover mineral deposits by the same means.

In the search for mineral deposits, the best evidence is obtained by putting down bore-holes. These are made by various methods, and are put down to a depth of a few feet when required for
testing the character of the foundation subsoil, or, if in other cases, to thousands of feet when required
in seeking for or estimating the value of deposits of coal, salt, and ironstone. Ages ago bore-holes were
wonderfully accomplished by the Chinese. Fifteen feet was the depth of each hole. Recently, in Europe and America, depths of
2000 feet have not unrequently been attained. At Schlabebach, near Merseburg, the deepest bore-
hole in the world has been put down by the Prussian government in search of coal. The sinking
may be followed by ingenious means between 1889-94, and the depth attained amounted to 5934 feet.

Bore-holes may be made by a circular borer moved by a lever. The rods are of iron, with
square heads, and are turned by a cross-head worked by a couple of men. In this way an anger-
like cutting action is effected. With harder rock it is usual to advance by means of percussion.
A chisel-headed tool is employed, which cuts holes of 3 to 4 inches in diameter. At each stroke the
bore-master causes the tool to turn slightly. When sufficient debris has accumulated the rods are
withdrawn, and the percussing done down to lose the powdered material and water. With a length of
rods amounting to 400 to 500 feet the weight is enormous, and, in consequence of the concussion,
difficulties arise. Men are not sufficient to raise the weight. In this case, the weight is built to
run on the rods a few inches or feet, and to let them fall suddenly. In other cases the rods are replaced
by a rope. This, however, from being wet and dry alternately, is apt to snap suddenly, and the
rods remaining in the hole are difficult to recover. This rock is brittle, and may break or alter the
nature of the iron itself be altered by the vibration. In putting down a bore-hole, a tower or shears is
erected over the hole. By making this 60 to 70 feet high, the rods may be extracted in lengths of
60 feet, and thus the 6 to 8 hours a day usually spent in proorcing the rods are saved. In some cases it is necessary to tube or line the whole
bore-hole. See Boring.

The Chinese method of boring with ropes has beenimitated in Europe with great economy, but with
great liability to fracture. The most efficacious method is to employ a chisel-bit with circular sides
so as to keep the bore-hole true. This is raised and allowed to fall a few inches or feet, according to the nature of the ground. It is attached to a weightier mass of iron or wood, serving as guides. The whole mass is suspended by a flat hawser rope. This rope passes over a
pulley to a drum on which a mass of rope can be accumulated. The pulley is attached to the piston
rod of a steam-engine. The action of the steam behind the piston lifts the pulley, and consequently the
tool, the rope being clamped. The steam then causes the tool to fall, and on falling it automatically
turns. A cylindrical tool can easily be inserted, and a core obtained that shows the nature of the rock and its inclination. At the Paris Exhibition of 1862 a prepare of the mine of Le Mans, in France, in
which diamonds were fixed. This was merely intended for use on a small scale; but it was soon applied to deep bore-holes. For this drill black diamond is employed, a substance with the fall hardness of 7.5, it is very hard to cause fracturing, besides which the full work is not done by the rodes.
This difficulty is obviated in several ways, notably by replacing the iron rods by wooden ones, 30 to 32 feet long, with iron connections. The free-falling
cutter proposed by Kind and the hollow rods of Von Oeynhausen may be instances as having rendered good service in the execution of great
works.

In order to open up a mine, tunnels or adit-levels are driven on the ledge or to cut it whenever the contour of the country allows it. Shaft-sinking
involves a larger outlay of capital and greater working costs. In the ordinary method of sinking shafts, the workmen standing upon the bottom of the pit, and the rock piled in, the rod is cut in the material to the surface by means of an engine, rope, and bucket. The sides of the shaft are
supported by timbering or walling. In water-bearing strata many difficulties are encountered.
Brunel, the father of the great engineer, proposed to obviate these by employing a circular frame with a cutting ring. On this, with hydraulic
mortar, a wall was built and held firmly together by ties. In a second method, largely used in
modern collieries, beams of cast-iron are employed, and 10,000 to 20,000 wooden wedges driven in, as
example of case (instances or rigis, known as
sinking, being built in. The shaft is thus sunk and the water pumped out. Tubbing a shaft is a
very difficult operation, and the method has fre-

quently been known to fail after £,000 to £,000,000
have been spent. This method was tried in 1840 in a

very difficult case and was found impracticable, and not un-
til 1859, when Champion, an eminent Belgian, took the matter in hand, was the method successful.
A watertight bottom was made, half a dozen work-
men at the surface doing all the work. The method has been employed in the United Kingdom in a
few instances. One remarkable case may be mentioned.
At the mouth of the Tyne are coal-measures of
great value, and at South Shields attempts were
made to work the coal under the sea. Difficulty, however, was caused by a band of massive lime-
stone, which is watered with fresh water. Thus, which was
promised to be very costly. Tubbing was totally

unsuccesful, notwithstanding the fact that enor-
mous pumps were employed raising as much as
11,000 gallons of water per minute. The shaft was

8 feet in diameter, and at the pumping ceased, water
rose in the shaft 12 feet in two minutes. Recourse was then had to the Kind-Champion method, which had previously been successfully
tried on the Continent. The tripod or cumber of the bore tool was 3 or 4 feet in diameter, and the
hole was bored to a certain depth. A larger cumber was then used. In this way the sides were formed into inclined planes, so that the fragments rolled into a suspended bucket in the smaller hole, the bucket being raised from time to time. When a
place was reached where a watertight bottom had been made, Champion's method was applied and the shaft successfully completed. In this tubbing the bottom ring has a sliding piece in which is placed a quantity of moss, which, when the whole length of tubbing comes to rest on the watertight bed cut for it under the water in the kind joint, is applied, and forms a tight joint. This method of sinking shafts is practically self-acting. It is economical and simple, and eliminates risk to human life. In
ordinary shaft-sinking accidents are frequent, as

a screw or a hammer falling down the yawning gulf is likely to produce a fatal injury.

An ingenious device for overcoming the difficulties of shaft-sinking was invented by a French engineer, Triger. This consists in damming back the water by employing a constant resisting force; that is to

MINING 215
of using a cartridge of this kind, clay may be forced down the hole by a claying bar so as to shut off feeders of water, and the hole will be dry enough to receive a charge of powder. A needle of iron or steel is placed in the midst of the charge with the ring at its end protruding, and tamping is introduced. The hole is then bridged up by clay, as at Berton, and the charge is then filled with a clay projectile until the whole is filled. Accidents may happen by pushing down the iron bar, which is apt to strike fire against hard rock. A second suspected cause is that, when a man takes a tamping bar and strikes it with a hammer, the air is compressed, and the temperature augmented sufficiently to explode the powder. The advantages are set aside by Messrs. Bickford & Smith's safety-fuse (see BLASTING). The older fuse consisted of carefully selected straws filled with fine powder. The safety-fuse is of cotton with gunpowder in the middle. For use in wet ground it is covered with a waterproof composition. Considerable attention has been paid to the subject of consolidating the charge. Excellent work has been done with compressed powder; dynamite has become quite indispensable; and gun-cotton is the best form being the compressed variety invented by Abel. Nitroglycerin—gun-cotton or tonite has also given admirable results. The fullest benefit of these modern explosives can only be obtained by the use of strong detonators fired by electricity, by which it is possible to place a number of bore-holes in such a manner that when fired simultaneously they shall help each other.

For removing coal these high explosives are too quick in their action, and blasting-powder continues to be used. Millions of tons of coal are still obtained by its aid. In order to obviate the danger of explosions in fiery collieries, many ingenious substitutes for blasting have been proposed. For example, a hole is bored, and wedges inserted to force down the coal which has previously been under-cut with the pick. Another plan of great promise is that devised by Smith and Moore, in which cartridges of cast steel are employed, water being forced into them by a force-pump. The pressure of steam generated by the usual charge of seven cartridges is 2850 lb., the cartridges themselves expanding to about five times their original size. The efficiency of these cartridges varies in the same manner as that of the coal; the best results having been obtained in the Derbyshire collieries.

The work of the miner engaged in underground cutting the coal-seam is very arduous, and various coal-cutting machines have been invented with a view to lessen the labour and expense. They work with compressed air or electricity, and have the cutters arranged on the periphery of a rotating disc, or on a travelling pitch-chain. Though largely employed in America, they have not yet come into extensive use in Great Britain. The coal, when broken by blasts, is conveyed to the surface by means of engine-power to the bottom of the shaft and raised to the surface.

The actual mode of working the coal, although varying greatly in every district, may be broadly divided into the following three classes: (1) the pillar, or (in Scotland) stop-and-room, method, where the first stage of excavation is accomplished with the roof sustained by coal; (2) the long-wall method, where the whole of the coal is allowed to settle behind the miners, no sustaining pillars of coal being left; and (3) the onestage method, which is the safer both as regards facility of ventilation and less liability to accidents from falls. At a Durham colliery, working the Harvey seam, which is 3½ feet in thickness, 5185 tons of coal were obtained when working by the long wall system, and 5032 tons when working by the post-and-stall.

Another ingenious process of sinking through quicksand is that devised by H. Poetsch. This consists in freezing the water contained in that portion of the water-bearing ground which occupies the position of the intended shaft into a solid mass of ice, and then sinking through it by hand without having recourse to water-tightness. This method has proved successful at several Continental collieries and at the Chapin mine in Michigan.

The average depth of coal-mines before the introduction of the steam-engine did not exceed 100 yards, whilst a near approximation for the present time would be 400 yards. The deepest shaft in Great Britain is that of the Ashton Moss Colliery, near Manchester, which has attained a depth of 2850 feet. The seams dip at the rate of 9 inches per yard, so that parts of the workings are 3000 feet deep. The deepest shaft in the world was until recently that of a silver-lead mine in Bohemia, at Prizbram, where the Adalbert shaft is 3432 feet in depth. This depth has, however, been exceeded in the Lake Superior copper-mining district, where in 1890 the Calumet shaft attained a depth of 3900 feet.

The cutting of a path through the harder rocks, as carried on by the ancient miners, was particularly laborious. The work was executed in confined spaces, and a large amount of dust was produced. The miners' vocations was excessively unhealthy, inasmuch as they were obliged to inhale larger quantities of dust; they thus became subject to disorders of the lungs to which they fell victims at an early age. Previous to the introduction of blasting the implements used were of the nature of wedges and hammers. Bit by bit pieces of rock were broken away, the operation being aided by natural fissures in the rock and by the brittleness of the hard material. In this way the ancient miners cut coffin-shaped galleries 5 feet in height. At the present time the galleries or levels are usually 7½ feet high and 5 feet wide, thus affording great facility for travelling and for ventilation. The iron wedge, is also of great antiquity than its application to mining purposes. In the 14th century it was largely used for musketry and cannon, and even for blowing down defences; but, curiously enough, it was not applied to mining purposes until the beginning of the 17th century, and even then made its way so slowly that it was not largely employed until the 18th century. In the operation of blasting use is made of a borer or drill of iron, or, as is more usual, of cast-steel. This is struck with a hammer. A borer of larger diameter may be used, held by one man and struck by another. Of late years mechanical rock-drills driven by steam or by compressed air have come largely into use; see BORING, with illustration. The bore-hole, when finished, is then charged. The gunpowder is enclosed in a little bag of cloth dipped in pitch and provided with a fuse. Instead
system. In thick and highly-inclined beds it is usual to remove the coal by horizontal slices, and to fill the excavation with waste material. In some instances blast-furnace slag is used for the purpose.

The mode of working metalliferous veins differs greatly from that followed in the case of great or less horizontal coal-beds. Horizontal galleries, termed levels, are driven upon the ledge usually 10 fathoms (60 feet) apart. They are rarely perpendicular but form an inclined gallery which follows the inclination of the vein. The levels are connected by means of small shafts, termed winzes. Represented on a vertical plane, the vein will thus be seen to be cut up into pillars which are worked by the method of stopping. Of this there are two varieties—underhand and overland stopping. In the former the ore is gradually worked away downwards from the floor of one level, the ore and worthless mineral being taken out through the level next below. In most districts underhand stopping has been superseded by the more economical overhand method, in which the miners stand on timber platforms and break down the mineral above them.

The great depth and size of modern collieries necessitate the raising of greater quantities of coal through a single shaft than was formerly the case. The winding-engines of modern erection are consequently of extraordinary power. Thus, at Harris' Navigation Colliery the engines have cylinders with a diameter of 54 inches, and are capable of raising 6 tons of coal, or, with ropes and the cages, seven tons at a load of 165 tons, at a speed of 32 feet per second. The quantities which can thus be raised are enormous. It is by no means uncommon for 900 to 1400 tons to be raised from one pit in the day.

In collieries both coal and men are raised in the cages, but in the metalliferous mines the mining-engine is largely used. This consists of a reciprocating rod or pair of rods fitted with steps, by which the miner is raised 8 to 14 feet at a stroke. Although this method obviates the tax on the energies of the men entailed by the climbing of ladders, it is open to the disadvantage that the characteristic advantages show that where men-engines are employed there are four times as many accidents as where cages and ropes or where ladders are used.

At the Épine collieries in France a remarkable machine the Épine-Adit adit, or cage employed. An air-tight wrought-iron tube, 5 feet 3 inches in diameter, is placed in the shaft and fitted with a piston-cage carrying nine coal-wagons. The air being exhausted above the piston, a load of 3 tons of coal is raised at a rate of 19 inches per second. The great cost of the installation has prevented the method from being generally adopted.

In almost all mines the surrounding rock contains water which rapidly accumulates in the workings. Where the contour of the district is suitable, the most usual method of draining the mine is by means of an adit-baffle or adit. In many cases extensive areas are drained by adits. Thus, the great Gwennap adit in Cornwall, which is with its branches 40 miles in length, drains 30 sq. m. As further examples of long adits may be cited the Vosges. The principal type of engine is that known as the Cornish pumping-engine, which is a single-acting condensing beam-engine working expansively. Some of these engines are of enormous size, the cylinders in some cases being as much as 100 inches in diameter. Their cost and ponderous character have led to the introduction of cheaper direct-acting engines which placed underground force columns of water to the surface by hydraulic power, as mentioned above. The silver-mine at Klausthal, in the Harz Mountains, a pair of direct-acting rotary engines have been erected, driven by hydraulic power, with a head of 1959 feet. At twelve revolutions per minute these pumps force 330 gallons of water up 750 feet.

The ventilation of the mine is a problem of the greatest importance. The air is contaminated by the respiration of men and horses, by the combustion of lights, by the smoke of explosives, and by deteriorous dust. Added to which, in the case of collieries, the insulins fire-damp or carburetted hydrogen exudes from the coal. Mingled with air this gas forms the explosive mixture to which so many miners owe their death (see Fire-damp, Choke-damp, Safety-lamp). It is obvious that the ventilating current must be sufficient to create this mixture below the firing-point and to sweep it away. The general mode of ventilating a colliery is to have two shafts, a downcast and an upcast. The pure air entering by the downcast shaft traverses the roadways of the colliery. By means of the pumps the gases are laid down without any reference to the phenomenon of the variation of the magnetic needle. Trusting to old plans constructed in this way, the miner may drive straight into old workings filled with water, the topping of which would be death to all employed in the colliery.

The progressive legislation in connection with mines (e.g., the Coal-mines Regulation Act of 1872, amended 1886, which prescribes for the inspection of mines by duly appointed inspectors, &c.,) has proved beneficial in diminishing the proportion of fatal accidents to the number of miners employed; for whereas in 1850, when the output of coal in the United Kingdom did not exceed 50,000,000 tons, the number of miners employed being about 200,000, the deaths slightly exceeded 1000 in the year, in 1877, when the output of coal was 84,000,000 tons and the number of miners double that in 1850, the deaths were only 1200 in number. The deaths from explosions of fire-damp during the twelve years 1875-1885 formed but 23.57 per cent. of the total deaths, the remainder being due to falls of earth or to disasters in mineral production, see Great Britain, United States, &c.

In England and Ireland the crown has the right to all mines of gold and silver; but where these metals are found in mines of tin, copper, iron, or
MINISTER

MINNESINGER

other baser metal, then the crown has only the right to take the ore at a price fixed by statute. In some gold, silver, and copper, it is necessary to limit the limitation, and silver-mines when three-halfpence of silver can be extracted from the pound of lead. As a general rule, in the United States as well as in Britain, whoever is the owner of freehold land has a right to all the mines underneath the surface, for his absolute ownership extends to the centre of the earth; but under special grants and contracts it is not uncommon for one person to be owner of the surface of the land and another to be owner of the mines beneath; or several persons may be owners of different kinds of mines lying one above the other. Many foreign states have the difference of ownership of the surface and the mines. On the public lands of the United States, a title or license may be obtained by any citizen from the general land office at Washington, at the rate of $5 per acre of surface pre-empted; no royalty is paid, but the claim must be worked in accordance both with the laws and with the general mining laws, which prescribe as one condition the performance of a certain amount of work annually. If this condition is not fulfilled, the mine may be ‘denounced,’ and any other person secure the claim.

BIBLIOGRAPHY.—The literature of mining is very extensive, but the following are useful works of reference: Callon’s Lectures on Mining, translated by Dr C. Le Neve Foster and W. Galloway; Sir Waring Smyth, Coal-mining (7th ed. Lond. 1890); J. J. Atkinson, The Complete Treatise on Coal-mining (Lond. 1879); R. Hunt, British Mining (1884); H. M. Chance, Report on Coal-mining (Philadelphia, 1885); B. H. Brough, Mining Surveying (3d ed. Lond. 1898); Armidale Rogers, Mining Law (Lond. 1870); Report of the Accidents in Mines Commission (1886). The principal sources of information on mining matters are the Transactions of the Mining Institutes, the technical and general journals, and the annual reports of H.M. Inspectors of Mines. See also articles Coal, Copper, Gold, Iron, Lead, Diamond, &c.

Minister, a public functionary who has the chief direction of any department in a state, the ministry being the body of ministers to whom the sovereign or the executive department assigns the executive government (see Cabinet, Parliament, Treasury). Minister is also a term for a delegate or representative of a sovereign at a foreign court (see Ambassadour). Christian preachers and priests are ministers of the word of God or of Jesus Christ in the Christian church. The ministry was adopted by French-speaking Protestants for their clergy, and was formerly so used by Anglicans, as it still is by Presbyterians and many Nonconformists.

Mulyer. See Furs.

Muk (Putorian), a name applied to several carnivores in the same genus as wassel, polecat, ferret, and ermine, and with essentially similar characteristics. The body measures from 12 to 18 inches in length, not including the bushy tail. The colour of the valuable fur is chestnut-brown. The Siberian Vison (P. sibiricus), the European Vison (P. lutreolus), and the American Mink proper (P. vison) are well-nigh identical, if indeed they are not only varieties of the same species.

They all live by rivers and lakes, in which they swim and dive, feeding chiefly on fishes, frogs, mussele, and the like; though not refusing any small mammals which come in their way. They are keen-scented, bold and amiable, but are readily tamed when caught young. See Furs.

Minneapolis, the largest city of Minnesota, adjoins the capital, St Paul, and is situated on both sides of the Mississippi, which is here crossed by twelve bridges. The Falls of St Anthony, with a perpendicular descent of 10 feet, afford a water-power which has been a chief source of the city’s prosperity. The streets are wide and handsome, and the buildings are well proportioned. Some of the most notable buildings are the masonic hall, the post-office, the Exposition Building, and the Guarantee Loan edifice. This last is twelve stories high, built of granite and sandstone; it contains 400 offices, and on the roof is a garden where concerts are given. The charities number over 150, and the public schools had in 1897 more than 750 teachers and 34,402 pupils; while the state university here has five departments and about 2500 students, of both sexes. There is a public library containing upwards of 10,000 volumes, and flour mills of Minneapolis are among the largest in the country. In the latter, stones have been discarded, and the Hungarian or ‘roller’ process (see Mull) is employed. The total daily capacity of the mills is 35,000 barrels. The growth of Minneapolis is very great, and the growth of the city has been remarkably rapid. Pop. (1870) 13,096; (1880) 46,887; (1890) 164,738; (1900) 292,718. Five miles by rail SE. of Minneapolis are the Falls of Minnehaha (‘Laughing Water’), celebrated in Longfellow’s Hiawatha.

Minnesinger, the collective name given to the lyric poets who contributed to the German minnesang during a period marked approximately by the years 1170 and 1250. For the most part the singers were of knightly birth and belonged to the inferior nobility, though men of the very highest rank, reigning princes and even emperors, wrote these lyric eminence of spirit, and a few were known who got their name from the principal theme that inspired them, minne = ‘love,’ the love of fair women. Thus they were so far akin to the troubadours of Provence and France. The movement, however, though it certainly originated with the singers beyond the Rhine, was essentially of native origin. The difference between the two schools is most clearly seen in the spirit of their work. The German singers wrote of love in a more refined and delicate spirit, with a greater reverence for the woman than the troubadours. The best of them treated of the inner life of the soul, the feelings and emotions of the heart, rather than of the gallantries and adventures of a sensual love; they move in the world of imagination and idealism, shunning the real world altogether. It is true that they, like the troubadours, had a latent attitude of ingenuous youth that characterised them was closely akin to the recurrent homage paid to the purest and holiest of women, the Virgin Mother of Christ. Yet they did not altogether lose touch of the world. They loved to sing the praises of nature, especially of spring, the perennial inspirer of poets’ hearts and tongues. Often, too, there is a decided strain of sadness and melancholy, always touching of true naïveté, and frequently of arch humour, and on occasion the stern note of moral indignation and contempt of the follies and foibles of man. Thus, the Minnesinger, like Walther von der Vogelweide, the most illustrious of them all, Heinrich von Ofterdingen, Wolfram von Eschenbach, Hartmann von Aue, Gottfried von Strassburg, Heinrich von Veldeke (the earliest), and others, were distinguished on the one hand by the secret of the moment, the sense of the deeds of martyr and saint, and on the other hand from the wandering gleemen, whose subjects were suited to the coarse and ignorant peasantry who formed their usual audiences. But it is not only subject only, and their spirit of treating it, that the minnesingers differ from the troubadours; they also paid great attention to poetical form, striving after melodious and sonorous language, regularity of verse-structure, and smoothness and correctness of versification, in all which they
attained a high degree of skill. Their art was, however, by a much smaller unity at the best and day: they not only wrote the text but composed the air to which the text was to be sung, for all their lyres were written with the express purpose of being sung to the accompaniment of violin or harp. One class alone was exempted from musical art—Art, by having, in the north-east, a few savants and other artists, whose compositions were called spruch = "sayings," which were recited. It was incumbent upon a 'singer' to invent his own combination of text and melody, and was considered dishonourable for him to appropriate those of his predecessors or contemporaries, the latter being workable for the development of the various forms, literary, and musical. This in course of time, when the fresh inspiration of the movement began to wane, was the fruitful cause of much artificial writing, and eventually of the decay of the art. But there were still deep causes of decay inherent in it. The less refined of the 'singers,' were unable to keep the levels of exalted sentiment of their superiors, and degenerated into false sentimentality, lifeless conventionalism, and above all a gross and vulgar sensuality. The minnesingers were inferior to the Swabian in the South, and the Middle High German. Their use of this language was due to the great encouragement they received from the Hohenstaufen emperors. Next to these rulers their chief patrons were the dukes of Austria, and especially Herman of Thuringia, at whose court Eisenach, the semi-mythical Wartburgkrieg occurred (c. 1207). This was a poetic contest between the chief minnesinger as to the merits of the patrons of the art: Heinrich of Ofterdingen was outsung by Wolther von der Veit, and finally, by the vanguard, Klingsof of Hnunga, by Wolfcraft von Eschenheid. When men of knightly birth began to neglect the writing of literary poetry, and the minnesinger were no longer held in honour in the halls of the great, the art took refuge with the burghers and craftsmen of the cities. It then became the interest of Hans Sachs of Nuremberg, those meistersinger or meistersinger, as they called themselves, possessed little real poetic feeling. They formed themselves into guilds and wrote poems as they plied their trade, by purely mechanical rules, and bound themselves by oaths of fidelity and mutual aid to observe the pedantic regulations. Their subjects were painfully commonplace, and their treatment destitute of all artistic feeling. Yet these singers' guilds flourished from the 13th to the 16th century; the last guild in Schwabach survived until 1389, at Ulm, Wagner's opera, Die Meistersinger zu Nürnberg, perpetuates their memory.

The songs of the 100 Minnesingers, of whom alone specimens survive, were published by Von der Hagen in 1838 (4 vols.). Modern versions have been made by Tieck (1861), Simrock (1867), Schott, and others. See A. Schultz, Das höhere Leben zur Zeit des Minnesangs (2 vols. 2d ed. 1889); Ulfand in Schriften zur Geschichte der Dichtung und Sagen (vol. v. 1870); and Lyon, Minnesang und Meistersang (1882).

Minnesota (Indian, 'sky-tinted water'), the most densely populated state in area in the states of the American Union, and 21st in area in the northernmost in the Mississippi valley, extends from 43° 30' to 49° 30' lat., and from 91° to 97° W. long. It is bounded on the N. by Manitoba and Ontario, E. by Lake Superior and Wisconsin, S. by Iowa, and W. by North and South Dakota. Its area is 83,330 sq. m., or nearly as large as Great Britain. In Minnesota are the remote sources of the great rivers Mississippi, Red River of the North, and St. Lawrence, whose waters, flowing in different directions, reach respectively the Gulf of Mexico, Hudson Bay, and the Atlantic Ocean. Within the state the Minnesota River is the largest tributary of the Mississippi, flowing into the St. Croix River and Red River of the North. It is a basin of clear lakes, the largest of which are Red Lake (530 sq. m.), Mille Lacs, and Leech Lake. About two-thirds of the state is prairie, but in the northern portion there are extensive pine-forests, and in the districts bordering on western Canada, a severe growth of tamarack and fir. The minerals include iron (which is profitably worked), slate, granite, and other rocks, and the red pipestone. The climate is bracing in winter, very dry and equable; the mean for the year 1890 was 45°. The rainfall is sufficient and well distributed throughout the year.

Minnesota is an agricultural and especially a wheat-producing state; its manufactures as yet are principally flour and lumber. The principal crops are: wheat, about 17,000,000 bushels; oats, 40,000,000 bushels; corn, 25,000,000 bushels; potatoes, 7,000,000 bushels. The facilities for commerce are great. The Mississippi is navigable as high as St. Paul; the lakes, with Duluth for a port, open a waterway to the Atlantic; and in 1897 there were 6193 miles of railway in the state.

The population at the census of 1890 was 1,311,000, in 1890, during which year over 354,000 pupils were on the roll. A system of free-school libraries is in operation. There are four state normal schools, and a state university at Minneapolis, besides Macalester College (Presbyterian) and Hamline University (Methodist), at St. Paul, Carleton College (Congregationalist) at Northfield, Episcopal schools at Faribault, and a Presbyterian college for women at Albert Lea.

History.—Minnesota was visited by French explorers in the 17th century, and was in 1803. Fort Snelling, at the mouth of the Minnesota River, was built and occupied in 1821. In 1837 the Chippewa Indians surrendered all the land east of the Mississippi; immigration then began, and Minnesota became a territory in 1849, a state in 1858. It claims the distinction of having, through its governor, offered the first regiment for the defence of the Union; and during the civil war, out of 40,000 citizens able to bear arms, it sent 24,000 to the federal army, incurred a terrible massacre, by the Indians, who attacked the frontier settlements and in ten days killed some 900 men, women, and children. As a consequence, the Sioues and Winnebagoes were removed from the state, and the Indian lands growing in population by farms and prosperous towns. The principal cities are St. Paul, the capital (163,063), Minneapolis (202,718), and Duluth (52,905). Pop. (1890) 1,72,923; (1890) 1,301,826, including a large proportion of Scandinavian and Germans; (1890) 571,304.

Minnow (Leuciscus phoxinus), a small fish of the same character as the perch, dace, eel, &c. It is widely distributed in Europe, from Norway to Italy. It is usually 3 or 4 inches long, but it occasionallv in favourable localities may attain to as much as 7 inches. The minnow varies its colour; it is more bright and vivid when fasting during the day than at night. The colours are most brilliant at spawning time, particularly in the males. The back is olive-brown in colour, becoming lighter at the sides with a metallic lustre. The fins are silvery gray, often rose tinted at the base. The minnow is an active little fish found in large swarms, generally in shallows in summer or near the surface; in winter it conceals itself under stones and muddy banks. It is a voracious feeder, living on aquatic plants, worms, insects, small snails and fresh-water molluses, and even its own kind; and in turn it is preyed upon by nearly
MINOR and MINT

every fish in the stream. Minnows have the peculiar habit of jumping the spokes of a wheel or the petals of a flower, with their heads towards the centre and their tails at nearly equal distances from one another when anything that can serve as food is thrown into the water. They may be caught by small hand-net or by hoop-net fixed with thread or leather. They are very prolific; they breed in June, and the eggs hatch in a few days. As food they are much esteemed, cooked in various ways or dressed as 'white bait.' They are used as bait for eels, or as spinning bait for trout, perch, pike, or chub. Some fish are a food, and a poison, in the Mahmoud, or even the Minnow, to feed the young salmon, but the wisdom of this proceeding has been questioned on various grounds.

Minor is, in Scotch term, the term describing a person who, if a male, is between the ages of 14 and 21; and if a female, is between 12 and 21. In England the technical term is an Infant (q.v.).

MINOR. See SCALE.

Minor Barons. See BARON.

Minorca, the second largest of the Baleares Island (sp. Menorca), N.E. of the group. Its 28 miles long, by an average of 10 wide, and has an area of 284 sq. m. Pop. 34,173. Its coast is rocky and inaccessible, but broken by numerous inlets, and its surface level, undulating, and stony. Its productions and climate are similar to those of Mallorca, and its soil is less fertile. The chief towns are Port Mahon (q.v.) and Ciutadella (8000).

The island is remarkable for its great number of ancient megalithic remains (called talayots) and its stalactite caves (at Prella). See BYNG (John); Bidwell's Baleares Islas (1876), and Sir R. L. Playfair's Minorca and Menorca (3d ed. 1890, Murray's Guide-book series).

MINORITY. See FRANCISCANS.

MINORITY. See REPRESENTATION.

Minor, the name of two mythological kings of Crete. The first is said to have been the son of Zeus and Europa, the brother of Rhadamantius, the father of Dencalion and Arinon, and, after his death, a judge of the shades in Hades. — The second of the Minors, is a grandson of the former, and son of Lycaon and Idla. To him the celebrated Laws of Minors are ascribed, in which he is said to have received instruction from Zeus himself. Homer and Hesiod know of only one Minor, the king of Cnosus, and son and friend of Zeus.

MINOTAUR, one of the most repulsive conceptions of Greek Mythology, the offspring of Pasiphaë and a bull, for which she had conceived a passion, gratified through the contrivance of Poseidon. The queen placed herself in an artificial cow made by Daedalus, and so became the mother of the monster, half-man half-bull, a man with a bull's head. Minos, the husband of Pasiphaë, shut him up in the Cretan Labyrinth, and there fed him with the seven youths and seven maidens, whom Athens was obliged to supply at fixed periods as a tribute, till Theseus, with the help of Ariadne (q.v.), slew the monster.

MINQUERS. See CHANNEL ISLANDS, JERSEY.

Minsk, chief town of a Russian government, situated on the Veret and the Herbert, 15 miles by rail E.N. of Warsaw. Pop. (1893) 89,070, of whom are Jews. The town existed in the 11th century; was Lithuanian in the 13th and Polish in the 15th; and was annexed by Russia in 1793. The government of Minsk has an area of 63,802 sq. m., and a pop. (1893) of 1,295,455, composed of White Russians (67 per cent.), Lithuanians (14 per cent.), Poles (11 per cent.), and Jews (10 per cent.), with Tartars and Germans. Seventy per cent. of the soil is covered with marshes, swamps, moors, lakes, and forests; less than 24 per cent. of the total area is actually cultivated.

MINSTER (Lat. monasterium, 'a monastery'), the church of an abbey or priory; but often applied, like Westminster, to cathedral churches without any monastic connection, as especially to York Minster.

MINT (Mentha), a genus of plants, of the natural order Labiate, with small, funnel-shaped, quadrifid, generally red corolla, and four straight stamens. The species are perennial herbaceous plants, varying considerably in appearance, but all with creeping rootstocks. The flowers are whorled, the whorls often grouped in spikes or heads. The species are widely distributed over the world. Some of them are very common in Britain, as Water Mint (M. aquatica), which grows in wet grounds and ditches, and Corn-mint (M. arvensis), which abounds as a weed in cornfields and gardens. All the species contain an aromatic essential oil, in virtue of which they are more or less medicinal. The most important species are Spearmint, Peppermint, and Pennyroyal.—Spearmint or Green Mint (M. viridis) is a native of almost all the temperate parts of the world; it has erect smooth stems, from one foot to two feet high, with the whorls of flowers in loose cylindrical or oblong spikes at the top; the leaves lanceolate, acute, smooth, serrated, destitute of stalk, or nearly so. It has a fragrant, agreeable odour.—Peppermint (M. piperita), a plant of equally wide distribution in the temperate parts of the world, is similar to spearmint, but has the leaves stalked, and the flowers in short spikes, the young whorls somewhat distant from the rest. It is very readily recognised by the peculiar pungency of its oil and of its taste.—Pennyroyal (M. paulegium), also very cosmopolitan, has a much-branched prostrate stem, which sends down new roots as it extends in length; the leaves ovate, stalked; the flowers in distantly globose whorls. Its smell resembles that of the other mints. — All these species, in a wild state, grow in ditches or wet places. All of them are cultivated in gardens; and peppermint largely for medicinal use and for flavouring lozenges. They are naturalised in America, where, however, the common species is M. canadensis, the Wild or Horse-mint. Mint Sauce is generally made of spearmint, which is also used for flavouring soups, &c. A kind of mint with lemon-scented leaves, called Bergamot Mint (M. citrata), is found in some parts of Europe, and is cultivated in gardens. Varieties of peppermint and Horse-mint (M. sylvestris), with crisped leaves, are much cultivated in Germany under the name of Curled Mint (Kurkdass M.); the leaves are dried and used as a domestic medicine, and in poultries and baths. All kinds of mint are easily propagated by parting the roots or by cuttings. It is said that mice have a great aversion to mint, and that a few leaves of it will keep them at a distance.
MINT

Peppermint, pennroyal, and spearmint are used in medicine. The pharmacopoeias contain an "aqua" or "tincture" of each. The officinal part being the herb, which should be collected when in flower. Peppermint is a powerful diffusible stimulant, and, as such, is antispasmodic and stomachic, and is much employed in the treatment of gastralgia and flatulent colic. It is also extensively used in mixtures, for covering the taste of drugs. Pennroyal and spearmint are similar in their action, but inferior for all purposes to peppermint.

Mint (Lat. moneta), an establishment for making coins or metallic money (see Money). The early history of the art being traced under the head Numismatics, the present article is mostly confined to a sketch of the constitution of the British mint, and of the modern processes of coining as they are now employed.

In Canute's laws, an officer called a 'reeve' is referred to as having some jurisdiction over the mint, and certain moneys which, in addition to that of the sovereign, appear on the Anglo-Saxon coins seem to have been those of the moneys, an important class of functionaries, who were, until the operations of coining were undertaken by the state in 1859, responsible for the correctness of the coin. Besides the sovereign, barons, bishops, and the greater monasteries had the control of mints, where they exercised the right of coinage, a privilege enjoyed by the archbishops of Canterbury in the reign of Henry VIII., and by Wolsey as bishop of York. After the Norman Conquest the officers of the Royal mint became to a certain extent subject to the authority of the exchequer. Both in Saxon and Norman times there existed, under control of the principal mint in London, a number of provincial mints in various parts of the kingdom; there were no fewer than thirty-eight in the time of Ethelred, and the last of them were only done away with in the reign of William III. The officers of the mint were formed into a corporation by a charter of Edward III.; they consisted of the warden, master, comptroller, assayer-master, wardens-coiners, and subordinates. Coining at the Scottish mint in Edinburgh ceased with the Union; but the office of master of the mint was not incorporated with the English one till 1817.

The practice of coining at one time formed no inconceivable item in the revenues of the crown. It was a deduction made from the bullion coined, and comprehended both a charge for defraying the expense of coinage, and the sovereign's profit in virtue of his prerogative. In the reign of Henry VI. the seignorage amounted to 6d. in the pound; in the reign of Edward I. it was 1s. 2d. By 18 Car. II. chap. 5, the seignorage on gold was abolished, and it has never since been exacted. The 'shre' or 'remedy,' as it is now called, is an allowance for the unavoidable imperfection of the coin in regard to both standard weight and fineness.

The function of the mint, so far as concerns the standard gold coinage, is to receive gold in ingots from individuals, and return an equivalent weight in money coins, each of which is exclusively coined for the Bank of England; for, although any one has the right to import gold into the mint for coinage, receiving an equivalent weight of sovereigns at the rate of £3, 17s. 10d. per oz. standard, after a sufficient delay to allow of the gold being converted into coin, he can at once receive payment on presenting his bullion at the Bank of England at the slightly lower rate of £3, 17s. 6d., and the additional 1½d. offered by the mint is not found sufficient to compensate for the necessary delay which occurs.

Silver, which was formerly a legal tender to any amount, has, by 50 Geo. IIII. chap. 68, ceased to be so. That act provided that each Troy pound of standard silver should be coined into sixty shillings, and, since this exceeds the price at which the metal in its uncoined state can be purchased, it follows that the coining of silver is a source of profit to the state. When the price fell to 42d., the seignorage, amounted to no less than 54 per cent. and even 60 per cent. The profit derived from the bronze token coinage is proportionately even greater. The seignorage, which was formerly retained by the master of the mint to defray the expense of coining, has since 1837 been paid to the credit of the Consolidated Fund.

A new mint was erected on Tower Hill in 1810. In 1815 some alterations were made in its constitution; and in 1851 a complete change was introduced in the whole system of administration. The control of the mint was then vested in a master, a deputy-master, and a comptroller. The master of the mint, who was appointed for life in the eighteenth century, became a political appointment held by an adherent of the government, was restored to the position of a permanent office, the master becoming the extensible executive head of the establishment. The office of comptroller was abolished, and in 1853 the office of master was removed from London to Westminster. Again, the officers of the mint were divided into two classes, and subordinate contracts for the actual manufacture of the coin. Further changes were made in the administration of the mint in 1860. The mastership was added to the duties of the Chancellor of the Exchequer, without any addition of salary, and the officers of deputy-master and comptroller were amalgamated. A yearly saving of £10,000 is believed to have been effected by the changes of 1851, and a further £6000 by those of 1869, with an increase of efficiency. Mints were established at Sydney and Melbourne to coin the gold so largely found in Australia, in 1853 and 1859 respectively.

Processes of Coining.—Down to the middle of the 16th century little or no improvement seems to have been made in the art of coining from the time of its invention. The metal was simply hammered into slabs, which were afterwards cut up into squares of one size, and then forged round. The required impression was given to these by placing them in turn between two dies, and striking them with a hammer. As it was not easy by this method to place the dies exactly above each other, or to apply proper force, coins so made were always faulty, and had the edges unfinished, which rendered them liable to be clipped. The first great step was the application of the screw, invented in 1553 by a French engraver of the name of Bruesel. The plan was not applied to the English crown coin till 1662, and not till 1662 that it altogether superseded the hammer in the English mint. The chief steps in coining as now practised are as follows:—The gold or silver to be coined is sent to the mint, for the most part in the form of bars, or as ingots, of 15 lb. Du. ingoten, 'to pour in,' 'to cast'), or castings; those of gold weighing either about 200 or 400 troy ounces, while the silver ingots are much larger. Before melting, each ingot is weighed and tested as to its purity by Assaying (q.v.). For melting the gold, pots or crucibles of plumbago
MINT

are used, made to contain each about 1200 ounces. The pots being heated in forncas, the bright red heat, the charge of gold is introduced along with the amount of copper which calculation, based on the weight of the gold and its composition as ascertained by assay, proves to be necessary in order to bring it to the standard, which in Great Britain is of three parts to 2 of copper (see ALLOY). The metal, when melted, is poured into iron moulds, which form it into bars 21 inches long, 12 inch broad, and three-eighths of an inch thick, if for sovereigns; and somewhat narrower, if for half-sovereigns. For melting silver (the alloy of silver and copper) the same process is used as for silver (18 to 19 parts of silver and 1 part of gold) larger plunger tools capable of containing 3500 ounces are used, and the metal is cast into bars similar to those of gold.

The copper, or rather bronze coinage, first issued in 1860, is formed of an alloy consisting of 65 parts of copper, 4 of tin, and 1 of zinc. The coin contains only about half the weight of their old copper representatives. The processes of casting and coinage are essentially the same as in the case of gold and silver.

The operation of rolling follows that of casting. It consists in successively passing the bars between pairs of rollers with hardened steel surfaces, driven by steam-power; the rollers being brought closer and closer as the thickness becomes reduced. At a certain moment, as the bars become longer, they are cut into convenient lengths; and, to reduce the hardness generated by the pressure, they are annealed. The finishing rollers are so exquisitely adjusted that the fillets (as the thinned bars are called) do not vary in thickness in any part more than the ten-thousandth part of an inch. The fillets are still further thinned in the British mint by means of what is called 'the draw-bench,' in which they are drawn between steel blocks, as in wire-drawing, and are then exactly of the necessary thickness for the coin intended.

The fillets thus prepared are passed to the tryer, who, with a hand-punch, cuts a trial blank from each, and weighs it in a balance, judging by experience whether the variation found to exist from the strict legal weight is such as to justify his passing the fillet into work. The blanks of which the coins are to be made are placed in the dies of the punching-machines of simple construction, in which two or more short steel plunger are forced by an eccentric through the fillet, and enter holes in the bed of the machine; the fillet is then advanced automatically and the operation repeated. The scrap left after the blanks are cut out, called scattd, is sent back to be re-melted.

To ensure their being properly milled on the edge, the blanks are pressed edgeways in a machine between two grooves, one in a fixed steel block, and the other in the face of a revolving steel disc, whereby the edge is raised and the blanks are brought to a uniform diameter. After this they are annealed to soften them, before they can be struck with dies; they are also dipped into boiling sulphuric acid, to remove oxide of copper from them. The blanks are then washed and dried, and washed with water, and dried in hot sawdust.

We now come to the press-room, where the blanks receive the impression which makes them perfect coins. The screw coining-presses which were erected in the mint in 1860 were superseded in 1865 by lever presses of what is known as the Ulmhorn pattern. Of these no less than sixteen now exist in the mint. It is not necessary to give any detailed account of their mode of action, but it may be explained that the lower die (see DIESINKING) is fixed, and, after the blank has been automatically laid on it, a steel collar which is milled on the inside rises so as to surround this collar. When the handle is depressed, the upper die descends upon it, considerable pressure being applied through a lever acting on a toggle joint. It will thus be seen that at the moment when the pressure is applied the blank is completely enclosed, the result being that all the details which exist on the two dies and on the collar are reproduced in the comparatively soft metal of the blank. The upper die then immediately rises, the collar descends, and the now finished coin is automatically pushed on one side to give place to another blank. In cases where letters are put on the edge of a coin and divided into segments working on centre pins is used. On the proper pressure being applied, the segments close round, and impress the letters on the edge of the coin. It is possible to strike coins at the rate of no less than 120 per minute, but it is found that the best results are obtained when the number does not exceed 90 per minute.

After being examined with a view to remove any faulty pieces, the finished coins are now passed on to be weighed in the automatic balances, since the act regulating the coinage (33 Vict. chap. 10) provides that no gold or silver coin shall be issued from the mint which varies by more than a specified and very small amount from the exact legal standard weight. These very beautiful instruments, which were introduced in 1844 by William Cotten, governor of the Bank of England, have since been much modified and improved. They are capable of weighing about twenty-three coins per minute within 1/1000 of a grain, and distributing them into three separate compartments, respectively for those which are too heavy, too light, or within the limits of weight allowed by law. The first two classes are returned to be melted, while the third class, having been hung on iron anvils with a view to eliminate such as are 'dumb,' are, so far as their manufacture is concerned, ready to be issued to the public. It is first necessary, however, that sample coins be taken for assay, as a final guarantee that they are within the limits as regards standard fineness allowed by the coinage act.

The gold coin is delivered to the importer (generally the Bank of England) as soon as finished, the weight of coin being the equivalent of that of the bullion imported, without charging any deduction for loss in the operations of coinage or for the cost of alloying metal. Silver coin, however, is made up in bags of 500 nominal value, and stored in the mint until required by the Bank of England, Scotland, or Ireland for distribution in either of these countries, or by the government of a British colony in which imperial silver coin circulates. In the same way bronze coin is made up in bags of £5 nominal value and kept in store.

The following table gives the full legal weight in grains of all Imperial coins of gold, silver, and bronze:

<table>
<thead>
<tr>
<th>Denomination</th>
<th>Gold</th>
<th>Weight in Grams</th>
</tr>
</thead>
<tbody>
<tr>
<td>Five pounds</td>
<td></td>
<td>610-2174</td>
</tr>
<tr>
<td>Two pounds</td>
<td></td>
<td>240-3493</td>
</tr>
<tr>
<td>Sovereign</td>
<td></td>
<td>120-7274</td>
</tr>
<tr>
<td>Half Sovereign</td>
<td></td>
<td>61-3972</td>

<tr>
<td>Halfpenny</td>
<td>85-9000</td>
</tr>
<tr>
<td>Farthing</td>
<td>49-4760</td>
</tr>
</tbody>
</table>

It will be noticed that in the case of both gold and silver the values are in proportion to the weights of the coins, but that this is not the case as regards bronze: whereas a ton of pence is nominally worth £448, the same weight of farthings is only valued at £373, 6s. 8d.
MIOCENE

In the United States there are live mints—at Philadelphia (since 1792), New Orleans (1835), St. Louis, Cincinnati, and New Orleans—all under the charge of the Bureau of the Mint of the U.S. Treasury Department, and presided over by the Director of the Mint. Only the first three are in active operation, the other two are really assay offices; and at Philadelphia alone all the official duties of the United States coins and their weights are as follows, those marked with an asterisk having been discontinued:

The total amount of gold coinage minted from 1793 to the end of 1882 was $1,380,981,508.50; silver, $431,254,106.00; minor coin, $17,463,608.44.

MINTO, SIR GILBERT ELLIOT, first Earl of, was born at Edinburgh, April 23, 1731. As a boy he spent two years at a school at Fontainebleau under the eye of Duke Hume, and, after passing through the universities of Edinburgh and Oxford, in 1773 entered Lincoln's Inn, and was called to the bar in 1774. Two years later he entered parliament as a supporter of Lord North, but in 1782 attached himself to Fox and Burke. In 1794-96 he was viceregal of Corsica. He was created Baron Minto in 1797, and went out to India as governor-general in 1806. He showed great vigour in his measures for establishing order and securing the frontiers by treaties, like that of Amritsar with Ranjit Singh. He next captured Mauritius and Bourbon, the Spice Islands and Java, but returned to England as Earl of Minto and Viscount Melgund in May 1814, to die on June 21st. See his Life and Letters, edited by his great-niece, the Countess of Minto (4 vols. 1874-80).

MINUCIUS FELIX, an early Latin apostate, of whose history nothing is known with certainty. His name survives through his Octaviana, a dialogue held by the bosom of Octavia, between the pseudo-Cicero, Caelius Natalis and the Christian Octavius Januarius. The latter succeeds in convincing his opponent, although his Christianity shows no trace of such distinctive dogmas as that of the resurrection. Cyprinian's De idololatria ductatu borrows from Octaviana; as also does Tertullian's Apologetus, according to Ebert; Tenssel, Kein, Köhn, and most scholars; the opposite view, however, is argued by Salmon.

MINNET, the air of a graceful dance, originally from Poitou, in France, and performed in a slow tempo. The music is in 3-time.

MINUTE, the 60th part of an hour; also the 60th part of a degree of a circle. See DAY, DEGREE.

MINUTE MEN, in the American Revolution, were light infantry, who were prepared for service at a minute's notice.

MINYAS, in Greek Mythology, the son of Chrysyes, the eponymous hero of the Myres, from whom were descended most of the Argonauts. He built the city of Orchomenus. His three daughters, Chelone, Iulis, and Atalante, or Lycome, Loucipe, Aletho, were changed into lats for having made light of the mysteries of Dionysus.

**Miocene System** (Gr., 'less recent'). The name was applied by Lyell to that division of the Tertiary strata which occurs in Britain, and contains many interesting and peculiar species of Mollusca than the Pliocene System (q.v.), and a larger proportion than the Pliocene. Of late years the lower part of the Miocene has been separated from that system, and ranked as a separate system (see Oligocene). No true Miocene strata occur in the United States. Marine accumulations of this age are sparingly developed in Belgium (Black Crag), and cover considerable areas in the low grounds of Touraine (Faluns de la Touraine) in the west of France. In the Rhine valley Miocene strata extend from the Taunus southwards (Mainz Basin). These beds are chiefly of fresh-water origin—the lower portion being marine. A more important Miocene area is met with in the Vienna Basin. Here the lower series of beds is marine, while the overlying strata are less distinctly so, many of the fossils indicating brackish water conditions. Another interesting development of Miocene occurs in Switzerland and South Bavaria—the beds being partly marine and partly of fresh-water origin. These are the more important European areas. In North America marine Miocene strata are found in the northeastern United States; in the frontiers of the eastern states; while fresh-water deposits of the same age are widely spread in the western states and territories. Miocene beds have been met with far within the Arctic Circle, in Greenland and Spitzbergen.

**Life of the Cretaceous.** The flora of the earlier stages of the Miocene of central Europe is indicative of somewhat tropical conditions, the nearest representatives of many of the more characteristic plants being now confined to India and Australia. Palm trees seem at that time to have flourished on a large part of Europe, and with these were associated conifers (Sequoia, Libocedrus), evergreen oak, fig, mulberry, casuarina, various proteaceas plants (Banksia, Dryandra), olive, magnolia, maple, myrtle, mimosa, acacia, &c. Later on the climate became more temperate, as we meet with brackish water conditions. Another interesting development of Miocene occurs in Switzerland and South Bavaria—the beds being partly marine and partly of fresh-water origin. These are the more important European areas. In North America marine Miocene strata are found in the northeastern United States; in the frontiers of the eastern states; while fresh-water deposits of the same age are widely spread in the western states and territories. Miocene beds have been met with far within the Arctic Circle, in Greenland and Spitzbergen.

**Miocene System** (Gr., 'less recent'). The name was applied by Lyell to that division of the Tertiary strata which occurs in Britain, and contains many interesting and peculiar species of Mollusca than the Pliocene System (q.v.), and a larger proportion than the Pliocene. Miocene beds have been met with far within the Arctic Circle, in Greenland and Spitzbergen.
and eastern Italy were at the same time under water, as was also the case with many parts of eastern Europe and Asia Minor. Southern Europe was thus in the Miocene period an extensive archipelago, in which the plateaus of Spain and central France, the Alps, the Carpathians, &c. existed as islands. The most continuous land mass was in the north of Europe: and if the Miocene of the Arctic regions, with its abundant flora, be of the same age as the Miocene of Europe, then we may infer that a vast area of the North Atlantic existed on dry land, and that there was migration of the flora through the North Sea. Considerable movements of elevation seem to have occurred in Europe before the close of Miocene times, causing the sea to disappear from wide regions which it had formerly occupied. Thus, the Mainz basin and the sea that occupied much of northern Switzerland, &c. were replaced by fresh-water lakes, while the wide sea of the Vienna basin was much reduced in size, and eventually became freshened—the conditions resembling those that characterise the Black Sea.

Miquelon, Great and Little, two islands connected by a long, narrow, sandy isthmus, off the southwest coast of Newfoundland, forming what is known as the extreme west side of the mouth of the Bay of Fundy, and of the Bay of Belle Isle. Fishing is nearly the only occupation, and dried and fresh cod and cod-liver oil are exported. Area, 93 square miles; pop. (1896) 6250.

Mir, the Russian commune, consisting of the inhabitants of one or more villages, who are as a community owners of the surrounding land, and to redistribute the same to the members from time to time. See Land Laws, Vol. VI. p. 562; RUSSIA; VILLAGE COMMUNITIES.

Mirabeau, Victor Riqueti, Marquis de, father of the great statesman of the French Revolution, was born, October 5, 1752, at Pertuis, in Provence, in a family of Florentine descent, but was really sprung from a wealthy bourgeois family of Digne and Marseilles that had acquired in 1570 the domaine of Mirabeau by marriage, and the title in 1805. He was an able mathematician and exceedingly hot-headed and self-willed man, who showed himself a senseless and brutal tyrant in the treatment of his family. It is said that he procured at one time or other no fewer than fifty-four lettres de cachet against his wife and children, and he strove to embitter the extraordinary generous by his greatest son by a course of unrelenting severity, which ended with shutting up all the ties of kindred and driving him into the most defiant and reckless excesses. Yet he was himself a theoretical philanthropist and active promoter of physiocratic ideas, and in this ence published a series of books, as Ainsi des Hommes (5 vols. 1755) and La Philosophie rurale (4 vols. 1763), in which the vigour of phrase often foreshadows the stronger hand of his son. He died at Argenteuil, 13th July 1780.

See: Lomont, Les Mirabeau (1788-9), and Oncken, De Mirabeau, 1880.

Honoré Gabriel Riqueti, Comte de Mirabeau, the greatest figure in the French Revolution, and perhaps the ablest statesman that France has yet produced, was born at Bigon in Provence, 9th March 1749, of a family that had been for three generations famous for stormy passions and great and liberal actions. A man of magnificent intellect were concentrated all the good and all the evil of his race; his unusually ugly face, scarred with smallpox and crowned with an immense mane of black hair, bore unmistakably the stamp of poverty, and from boyhood he possessed a marvelous personal fascination which subdued all men and women to his will. His education was left to take care of itself, and at seventeen he entered as a lieutenant the Berri regiment of cavalry, and lived a life of such reckless brutality at the little garrison-town of Saintes that his imperious father imprisoned him in 1768 on the Isle of Ré, near Bordeaux, with the French legion of Lorraine to Corsica, which he had earned him the confidence of his chiefs and the affection of his men. But his father refusing to purchase him a company, he left the service in 1770, and settled down to practise the profession was keen on war and migration as the floor was free. Considerable movements of elevation seem to have occurred in Europe before the close of Miocene times, causing the sea to disappear from wide regions which it had formerly occupied. Thus, the Mainz basin and the sea that occupied much of northern Switzerland, &c. were replaced by fresh-water lakes, while the wide sea of the Vienna basin was much reduced in size, and eventually became freshened—the conditions resembling those that characterise the Black Sea.

was sent by the French government on a secret mission to Berlin, and there from Major Manvillon he obtained the materials for his work, *Sur la monarchie, sans le roi*. (See *Hist. de France* vol. 5, 1787.) When the States-general was convened he offered himself as a candidate to the nobles of Provence, and was rejected, whereupon he turned to the tiers état and was returned enthusiastically for both Marseille and Aix. He chose the city of Aix as the seat of the convention (see *Hist. de France*, vols. 1787). When the States-general was convened he offered himself as a candidate to the nobles of Provence, and was rejected, whereupon he turned to the tiers état and was returned enthusiastically for both Marseille and Aix. He chose the city of Aix as the seat of the convention (see *Hist. de France*, vols. 1787).

Mirabeau’s political sagacity and foresight quickly made him a great force in the Assembly, while his audacity and volcanic eloquence made him at once the darling of the mob and the terror of the court. Meantime he extended his influence beyond the limits of the Assembly in the work of journalism, for his États-Généraux, Lettres à mes Correspondants, and Courrier de Provence, drew on the knowledge and abilities of a host of condutors, such as the Genevese Durovery and Étienne Dumont. Moved by his instinctive dread of anarchy, he proposed the establishment of a national guard, in which he, at the very beginning, held the rank of general. He grew the National Guard, but he trembled at the ‘nocturnal orgies’ of August 4, 1789, when in the breathless legislation of a single night were swept away together serfdom, feudal jurisdiction, monarchical ground-rents, tithe, game-laws, saleable offices, judicial tribunals, mutual contributions, ecclesiastical, privileges, privileges of rank, exemptions from taxes, and pluralities of offices and livings. None of his contemporaries equalled him in breadth of view, temperance in judgment, and freedom from prejudice—no actor in the great drama saved himself that the notion of equality is only a fit of the revolutionary fever. He saw clearly the fatality of such schemes as the foolish Lafayette’s theatrical declaration of the rights of man, pointing out that such a thing might well enough be done after the war and the king had been put away. Mirabeau was not personally responsible for the furious émeute of October 5 and 6, which brought the king to Paris, for indeed hatred of anarchy was his most deeply-rooted political principle. As early as May 1789 he had tried in vain to come to terms with Necker and Lafayette, yet his character was too magnanimous to desire revenge for the rebuffs with which his overtures had been received. He formed a warm friendship with the Count de la Mare, a particular friend of Marie Antoinette, and in conjunction with him he drew up the address of the representatives of the third estate to the king in the Assembly, just after the transference of the king and Assembly to Paris. In this admirable paper he set forth the necessity for a new constitution, the initiative to come from the king; that such a course would be best conducted by a responsible ministry appointed after the pattern of the English parliamentary usage; and that the king must leave Paris for some such loyal city as Rouen, and throw himself frankly upon France. He suggested a ministry, with Necker and Lafayette as his prominent members, himself to have a seat but no portfolio. But the infatuated queen detected and distrusted the great tribune, and the Assembly, mad with suspicion and fear, passed a suicidal self-denying ordinance (November 7, 1789) that no member should take office under the crown while holding his seat, or for six months after. Mirabeau’s hopes were thus blasted for the time, yet he worked on with unabated energy. He 1789, and surrounded by his enthusiastic friends who provided him with his facts, and even wrote for him his speeches and articles, content to efface themselves to enhance a beloved master’s glory. Never was there so marvellous a collaboration of unpaid enthusiasm: Thumié, and Drouet, and Gérard, in Paris and Bayonne, the financial; the Abbé Lamourette, those on the civil constitution of the clergy. Pellenc, the private secretary, constantly accumulated facts; the Genevese Feyraz wrote the speeches on the attent. And on the right of making war and peace. The orator took freely these material so generously prepared for him, fused them in the alchemic of his own marvellous genius, and stamped them fresh with the impress of his own individuality.

In the spring of 1790 communication opened anew with the court, and fresh appeals were made to Lafayette. If Mirabeau was a bitter enemy of feudalism he was a devoted friend of order, and saw the necessity of a strong executive as its foundation, but he was constantly mortified to find himself on a rostrum mistress of the royal court or his interrupting him in judgment against him, and he could not gain the full confidence either of the respective classes or of the court—as he himself said bitterly to Dumont, ‘The sins which I committed in my youth are giving me their full punishment now.’ The court provided money to put his designs in effect, but they were scheduled at 208,000 livres—among them the bill for his wedding-clothes—and agreed to allow him 100 louis a month, with 300 livres for De Comps, his copyist, whereupon Mirabeau broke out into indescribably extravagance. He risked all his popularity by successive measures, and took at least one month of war and peace and the king being gone, and the Assembly, on the 3d July the queen gave him an interview in the gardens at Saint-Cloud, and at its close Mirabeau, with the fine chivalry of his nature, as he bent to kiss her hand, assured her with the words, ‘Madame, the monarchy is saved.’ But as the popular movement progressed his dream of placing the king at the head of the revolution became more and more a dream, and he was cut to the heart to find, as he did by the winter of 1790, that the king had not gained a foot of confidence, but listened also to other counsellors than himself, and that it would not accept his plan of an appeal to the provinces. He insisted Montmorin in his management of foreign affairs, and showed himself a really great financier in his measures to avert national bankruptcy, while he continued to interchange notes of advice with the court. His secret aim was now to undermine the popularity and influence of the Assembly, and compel it to dissolve. Neither counter-revolution nor foreign intervention were within his schemes, but he hoped to guide to a moderate conception of liberty and to wise concessions to the throne. He suggested the establishment of a bureau of correspondence with the provinces, a publishing committee to buttress the Assembly, and an organized system of ascertaining the opinions of journalists and leading politicians. But the queen would not commit herself to the trilune, and Mirabeau’s heart sank within him as he saw slip from his grasp his great dream of establishing a responsible parliamentary government in France. This summer his health and eyesight gave way alarmingly, but he refused to alate his great labours. In December 1790 he was elected
MIRABEAU

Mirabeau, a term commonly applied to certain miracles, was the first to secure an object of wonder or surprise. The same meaning is the governing idea in the term applied in the New Testament to the Christian miracles, 

"a marvel," "a portent;" besides which, we also find them designated \(\text{dynamis},\) \(\text{powers},\) with a reference to the character or claims of which they were assumed to be the witnesses or guarantees. Under these different names the one fact recognised is a deed acknowledged by the common judgment of men to exceed nature, and claimed in a certain aspect of words, a deed \(\text{supernatural},\) beyond the common powers of nature, as these are understood by men.

In the older speculations on the subject, a miracle was generally defined to be a violation or suspension of the order of nature. While, on one hand, such an interference might be claimed in a certain aspect of the word, a deed \(\text{supernatural},\) beyond the common powers of nature, as these are understood by men.

MIRACLE

certain results. To affirm that these results are either impossible in themselves, or necessarily violations of natural law, is to pronounce a judgment on imperfect data. We can only say that, under an impulse which we must believe proceeds from the Divine will, in which all law subsists, the phenomena which we have been accustomed to expect have not failed to appear. But for our present purpose we cannot affirm that the question as to how this happens is one of interference or violation; it is rather, probably, one of higher and lower action. The miracle may be but the expression of a law, the effect of which is not evident when it has a special beneficent purpose to serve.

The evidence for the Christian miracles is of a twofold kind—external and internal. As alleged facts, they are supposed to rest upon competent testimony, the testimony of eye-witnesses, who were neither deluded nor deceiving, who had no motive for deceiving others. They occurred not in privacy, but for the most part in the open light of day, amidst the proessed enemies of Christ. They were not isolated facts, nor wrought tenets. They were in Colorado repeated, the overflowing expression, as it were. No miracles are necessary in any supernatural life. The gospel miracles, moreover, are supposed in themselves to be of an obviously Divine character. They are miracles of healing, of beneficence, in which the light equally of the Divine majesty and of the Divine love shines.

Spinoza strongly controverted the possibility of miracles, explaining the events he supposed as caused by the豪华 of his creatures, that theory of miracle is certainly most rational which does not represent the law of nature and the will of God as separate and opposing forces, but which represents the Divine will as working out its highest moral ends, not against but through law and order, and evolving from the law. Nature being but the plastic medium through which God's will is ever manifested to us, and the design of that will being, as it necessarily must be, the good of His creatures, that theory of miracle is certainly most rational which does not represent the law of nature and the will of God as separate and opposing forces, but which represents the Divine will as working out its highest moral ends, not against but through law and order, and evolving from the law.

The experience of modern history shows that when it has a special beneficent purpose to serve.

when the ship is above the horizon, only one image, and that inverted, is found; but when it is wholly or in great part below the horizon, double images, one erect and the other inverted, are frequently seen. The faithfulness and distinctness of these images at times may be imagined from the fact that Captain Scoresby, while cruising off the coast of Greenland in 1822, discovered the property of his father's ship from its inverted image in the sky. Another remarkable instance of mirage occurred in May 1854, when from the deck of H. M. screw-steamer Archer, then cruising off Osel, in the Baltic, the whole English fleet of nineteen sail, then nearly 30 miles distant, was seen as if suspended in the air upside down. Besides such phenomena as these, the celebrated \textit{Fata Morgana} (q.v.) of the Straits of Messina sinks into insignificance. The \textit{Spectre of the Brocken} is a magnified shadow of persons, &c., on the summit of the mountain, seen at sun-down and sunrise thrown on mist banks on the side of the mountain opposite to the sun, with or without rainbow colours. This is rather a glory than a mirage proper (see HALOS). Its varieties are indeed numbersless, and the variations of the refraction in Brewster's \textit{Opticks}, to \textit{Bois' Trait\'e de Physique}, and for the mathematical theory of the mirage to Tait on \textit{Mirage}, \textit{Trans. Roy. Soc. Edin.}, 1881. See also \textit{Reflection} and \textit{Refraction}.

\textbf{Miraj}, a native state of India in the southern Mahtra country; pop. 69,732. The capital, Miraj, near the Kistna River, has a pop. of 26,610.

\textbf{Miramar}, a palace standing on the rocky shore of the Adriatic near Trieste, in the SW. of Italy, the home of the Archduke of Austria, afterwards Emperor of Mexico. See also \textit{Maracaibo}.

\textbf{Miramichi}, the second river (220 miles) of New Brunswick, entering the Gulf of St Lawrence through Miramichi Bay. It is navigable to 2 miles above Newcastle, the principal town on its banks, Salmon and trout abound both in the river and its tributaries, in one of which there is a government fish-breeding establishment.

\textbf{Miranda}, or \textit{SA de Miranda}, \textit{Francisco de} (1495-1558), a Portuguese poet, founder of the school of which Camoes is the most brilliant representative. His earlier efforts were written in Spanish; but he wrote in the last years of his life, when a captive in Algiers, in Portuguese; his most characteristic works, his epistles in verse, are all in Portuguese but one. His works appeared at Lisbon in 1595: a better edition in 1614; the most scholarly one, by Vassanellos, at Halle in 1883.

\textbf{Mirandal}, a town of Northern Italy, 15 miles by rail S.N.E. of Modena. It has a fine cathedral and an old castle. Pop. 3039. See \textit{Pistoia}.

\textbf{Mirecourt}, a town in the department of Vosges, 236 miles by rail E.S. of Paris, with manufactures of lace and musical instruments. Pop. 5344.

\textbf{Mirfield}, a manufacturing town in the West Riding of Yorkshire, 3 miles W. by S. of Dewsbury, and 44 NE. of Huddersfield. It has a townhall and market; pop. 10,500 (1891); principal persons, Sir G. G. Scott), and manufacturers of woollen cloths, carpets, blankets, &c. Pop. of parish 15,872; of town (1881) 11,563; (1891) 11,707.

\textbf{Mirror}, a reflecting surface, usually made of glass lined at the back with a brilliant metal, so as strongly to reflect the image of any object placed between it and the source of light. It was long a matter of common knowledge, but the use of a reflecting surface would become apparent to the first person who saw his own image reflected from water; and probably for ages after the civilisation of man commenced the still waters of ponds and lakes were the only mirrors; but we read in the Pentateuch of mirrors of brass being used by the Hebrews. Mirrors of bronze were in very common use amongst the ancient Egyptians, Greeks, and Romans, and many specimens are preserved in museums. Praxiteles taught the use of silver in the manufacture of mirrors in the year 232 B.C. Mirrors of glass were first made at Venice in 1590; and judging from those still in existence, which may be seen at Holyrood Palace, in the apartments of Queen Mary—they were very rude contrivances, in comparison with modern ones. It was not until 1673 that the making of mirrors was introduced into England. It is now a very important manufacture; and mirrors can be produced of any size to which plate-glass can be cast. After the plate of glass is polished on both sides, it is laid on a perfectly level table of great strength and solidity, usually of smooth stone, made like a billiard-table with raised edges; a sheet or sheets of tinfoil sufficient to cover the upper surface of the glass are then put on, and rubbed down smooth, after which the whole is covered with quicksilver, which immediately forms an amalgam with the tin. The superluous mercury is then run off, and a wooden mould is made on which when hardened, and square iron weights are applied. After this process has been continued a day and night, the weights and the cloth are removed, and the glass is removed to another table of wood, with a movable top, which admits of gradually increasing inclination until the un amalgamated quicksilver has perfectly drained away, and the film of amalgam remains coating the glass, and perfectly adherent to it. Mirrors are also made by silvering glass with an ammoniacal solution of a silver salt to which tartaric acid and sugar-candy have been added. Heat is reflected like light; so that a convex mirror may be used to bring rays of heat to a focus. In this way combustible substances may be set on fire at a distance from the reflector whence they receive their heat. Thus used, a mirror is called a \textit{Burning Mirror}.

The mirror is one of the most characteristic features of Japanese life and legend. It is usually of bronze, convex, polished by mercurial amalgam, and engraved on the back. In a few specimens the mirror may be used as a mirror in the ordinary way, but bright light reflected from its polished surface converges to a spot and produces weight-lined images corresponding to the figures on the back. This property of the so-called \textit{Magic Mirror} of Japan is (according to Professors Ayrton and Perry) due to inequalities of curvature associated with inequalities of thickness, the thicker portions being the flatter.

\textbf{Mirza} (a contraction of \textit{Emir Zulah}, "son of the prince"), a Persian title, equivalent to \textit{Prince} when it follows the surname, and merely the common title of honour (like our \textit{Mr}) when it is prefixed to it.

\textbf{Mirzapur}, a town and district in the North-western Provinces of British India. The town stands on both banks of the river Kumaon, by rail SW. of Benares. It has manufactures of shawls, carpets, and brass-ware. Pop. (1891) 84,130. The district has an area of 5,228 sq. m., and a pop. (1891), almost all Hindus, of 1,161,808.

\textbf{Miscarriage}. See \textit{Abortion}.

\textbf{Misdemeanour}. In the law of England and Ireland, means a crime not involving forfeiture of liberty. In the United States it is either treason, felony, or misdemeanor; and in creating new offences the legislature determines how they are to be classed. The distinction between felony and misdemeanour is not logically drawn, and it would disappear if the criminal law were codified on a rational plan. See \textit{Stephens' Hist. of Crim. Law}. 

\textbf{Miser}.
Miseno, a promontory forming the western side of the Bay of Pozzuoli (Cuma), 10 miles SW. of Naples. On it are ruins of the ancient city of Misenum, which Augustus made one of the principal stations of the Roman fleet.

Miserere, the name by which, in Catholic usage, the 50th Psalm of the Vulgate (51st in Authorised Version) is commonly known. It is one of the so-called ‘Penitential Psalms,’ which are said after Lauds on the Fridays in Lent, except Good Friday. It has been commonly understood to have been composed by David in the depth of his remorse for the double crime which the prophet Nathan rebuked in the well-known parable (2 Sam. xii.). Another opinion, however—plainly stated by Theodore of Mopsuestia (died 428), and adopted by many moderns—attributes this psalm to some of the psalm-writers of the Captivity; whilst others, again, hold that the last two verses only were added after the return from the Exile.

Miserere, a projection on the under side of the seats of the stalls of medieval churches and chapels, &c. They are usually ornamented with carved work, and are so shaped that when the seats proper are folded up they form a small seat at a higher level, sufficient to afford some support to a person resting upon it. Aged and infirm ecclesiastics were allowed to use these during long services.

Misericordia, or Miseri-corde (‘mercy’), a narrow-bladed dagger used by a knight in giving the coup de grâce or finishing stroke to a wounded foe.—Misericordia is also the name of a society (of laymen) in Florence, founded in the 13th century, who tend the poor sick, carry victims of accident or disease to the hospitals, and the dead to their burial. At the end of the 16th century the heads of the community, including the highest, are enrolled in this charitable association; and their soubre and forbidding surroundings—_contrastingly in their dark monastic dress, with the cowl pulled down over the face so that the eyes merely peep through little holes—is not assumed because the Frati della Misericordia are penitents, but to check demonstrations of gratitude to the individual brethren.

Mishne Bittot. See COPTICS.

Mislima (from Heb. shana, ‘to learn,’ erroneously held to designate Repetition), comprises the body of the ‘Oral Law,’ or the juridical-political, civil, and religious code of the Jews; and forms, as such, a kind of complement to the Mosaic or Written Law, which it explains, amplifies, and in part abrogates. It was not, however, on the authority of the schools and the masters alone that these explanations, and the new ordinances to which they gave rise, depended, but rather on certain distinct and well-authenticated traditions, traced to Mount Sinai itself. The Mislima (to which the Toseftas and Boraftas form supplements) was finally redacted, after some earlier incomplete collections, by Jedudah Hanassi, in 229 a.D., at Tiberias. It is most written in New Hebrew, and is divided into six portions (Sedarim): 1. Zeraim (Seeds), or agriculture; 2. Moed (Feast), on the Sabbath, Festivals, and Fasts; 3. Nashim (Women), on Marriage, Divorce, &c. (embracing also the laws on the Nazirship and Vows); 4. Nezikim (Damages), chiefly civil and penal law (also containing the ethical treatise Aboth); 5. Kodashim (Sacred Things), of sacrifices, &c.; description of the Temple of Jerusalem, &c.; 6. Ta'haroth (Pureifications), on pure and impure things and persons. See also EXEGESIS, Vol. IV. p. 497; TALMUD.

Misiones, an Argentinian territory, lies between the Uruguay and the Paraná, and is bounded on all sides but the SW. by Brazil and Paraguay. Area, 20,823 sq. m.; pop. 30,000—though before the expulsion of the Jesuits (1767) it exceeded 100,000. There are three low mountain-chains radiating from the centre. The greater portion of the surface is covered with forest, producing building and dye-woods, oranges, medicinal herbs, and the yerba mate. Maize is largely grown, and sugar-cane to some extent; of late years several sugar-houses have been erected. Capital, Posadas (pop. 3000), on the Paraná.

Miskolcz, a town of Hungary, 112 miles by rail NE. of Pesth. Pop. 30,408.

Misprision. See TREASON.

Misrepresentation, a false statement affecting the validity of a contract or transfer of property. Wilful misrepresentation is considered as Fraud (q.v.). Innocent misrepresentation affects the formation of a contract in cases where one party has to rely on statements made by the other. An insurance company grants a policy in reliance on the statements made by the insured; a purchaser of land must rely on statements made by the vendor; an applicant for shares in a company relies on the truth of the prospectus. In these cases even unintentional misrepresentation will prevent the party responsible for it from enforcing the agreement against the party who has been misled. There are also cases in which a party is taken to warrant the truth of his statement; in these cases even an innocent mistake may give the other party a right to be discharged altogether, or a right to claim damages for breach of warranty.

Missal, the volume containing the prayers used in the celebration of the Mass. Anciently, considerable variety in minor details prevailed among the books in use in different countries, and even in different churches of the same country. With the view of restoring uniformity, the pope, in virtue of a decree of the Council of Trent, in 1570, ordered that all churches which had not, for a clearly ascertainable period of 200 years, enjoyed an uninterrupted use of a peculiar service-book of their own, should
thenceforth adopt the Roman Missal. Of this exemption several churches in Germany, France, and even in Italy availed themselves; but in later times the great majority have conformed to the Roman use. The Roman Missal has twice since that date been subjected to revision and correction—in 1694 by Clement VIII., and in 1634 by Urban VIII. The latter, however, was never issued in print. The missals of the oriental rites differ from that of the Roman Church, each having for the most part its own proper form. See Liturgy.

**Missions.** The truth and divine origin of Christianity being assumed, it might have been expected that missions to propagate the faith should have been carried on continuously till the world was evangelised, and that that goal should have been reached long ere now. It has not been so. There have been long periods of intermission, during which the work either ceased, or was prosecuted without zeal or energy; and others during which abundant zeal was neutralised by a strange lack of discretion. In point of fact there have been but three periods in the history of the Church which have been distinctively marked as missionary periods, and a history of missions would be fairly complete if it gave an account of (a) the apostolic; (b) the post-apostolic; (c) the medieval; and (d) the modern missions.

**(a) Missions of the Apostolic and immediately subsequent Ages.**—It is certain that the gospel made great progress during the lifetime of the apostles. From the 'Acts of the Apostles' it is manifest that within a few years of the resurrection of Christ the gospel obtained a footing in most countries to the east and the north of the Mediterranean; while from other authentic sources we learn that in the same brief period it was successfully introduced into Egypt and the other African regions on the southern shores of that sea. Neither Gibbon, in his estimate of the effects of 'secondary causes,' nor the orthodox apologists who criticised that estimate, nor writers of the history of missions in our day appear to estimate highly enough the part which the apostolic Jews and proselytes of whose conversion to the faith we read in the second chapter of the Acts. While there were in Jerusalem tens of thousands of Jews who had never left the precincts of the Holy Land, and who had no language but the Hebrew of their Scriptures and the life into which it had degenerated, no mention is made of them as witnesses of the miracle of the gift of tongues, but only of the Hellenistic Jews and proselytes who had come for the observance of the great feast from numerous Asiatic, African, and European lands, and from the remote islands of the sea. Of these three thousand were baptised. They thenceforth constituted a native agency for conveying the message of the gospel into their several lands, and telling of 'Jesus Christ and the redemption of mankind.' They would not like the apostles be scattered abroad, except the apostles, but they were prepared to take the place of the apostles in preaching the word. It must have been through the labours of these evangelists, under the direction of the apostles, that Christian churches were founded in many places remote from Jerusalem—as, for example, at Damascus, where we find a church of the apostolic constitution as early as the 13th, the 12th, or, at most, the 11th century. There are, indeed, two exceptions, that relating to the foundation of a church in the kingdom of Edessa by Thaddæus, and that which ascribes the introduction of the gospel into India to the apostle Thomas. The apostles, however, are apocryphal 'acts,' which are certainly of an early date. The books contain multitudes of mistakes and anachronisms, and cannot be regarded as historical authorities; but they wear the aspect of a misapprehension of actual facts and occurrences, rather than that of pure invention. A great amount of probability than is usually assigned to it appears to belong to the apostolic origin of the Syrian Church in Southern India (see Thomas, St.).

We have no sufficient data from which to estimate the rate of the progress of the gospel during the apostolic age. From such data as exist staatsists have estimated the number of Christians existing at the death of the apostle John, or at the close of the first Christian century, at numbers varying from less than a quarter of a million to more than half a million. But much lower were the estimates of the actual number was a mean between these two extremes, or even that it lay between them at all. It may possibly have been below the smaller, or, equally possibly, above the greater. Certainly, however, the number was large. The testimony of Tertullian to this effect is extremely valuable in itself if it stood alone. But from it, confirmed as it remarkably is by the unexceptionable testimony of the younger Pliny, it cannot but be inferred that within a century of the resurrection of Christ the gospel had been preached over a large part of the Roman world, and that at least in some provinces, as in Bithynia, the gospel was threatening to supersede the worship of the gods of the empire.

**(b) Medieval Missions.**—Apart from missions in the technical sense of the term, it is certain that various causes contributed to the wide diffusion of a knowledge of the gospel. Setting aside some altogether untrustworthy legends and traditions, we find no reason to believe that the gospel was first introduced into the British Islands by apostles or apostolic men, or by missionaries specially set apart for the purpose. It is certain that before the time of Constantine there were churches of considerable extent both in the southern and the northern sections of Britain. The most probable supposition is that these churches owe their origin to the intercourse of Britain with Rome, which began with Caesar's invasion, and soon attained a great extent. Soldiers and civilians came from Rome to Britain, some of whom were Christians, while others brought with them Christian slaves. British merchants went to Rome as traders, British chieftains as diplomats, British ladies as hostesses, and the earlier order of the monastic and medieval centuries. If Patrick really was a Briton, as seems demonstrable, he was the great leader of the British missionary host. He found Ireland entirely heathen, and he lived to see it professes Christian. During his lifetime was established not only the kingdom of saints and a land of scholars, in whose schools were trained not only the choicest youths of the neighbouring Britains, but many also from the continent of Europe. The debt that
Ireland owed to Scotland for the mission of Patrick, the noble man, by the mission, just a century later, of Columba and his associates to Iona. The religion imported probably in a casual way by Roman soldiers and Roman civilians and it is a linden of the depth of the darkness which it had to penetrate. If the Scottish Patrick might be fitly be called the apostle of Ireland, and the Irish Columba in some sort the apostle of Scotland, Aidan, one of the Iona 'family,' is entitled in like sort to be regarded as the apostle of Northumbria; and St. Cuthbert was a spiritual descendant of Aidan. Moreover, the Irish-Scottish missionaries were the great evangelists of a large part of the European continent. Ebrard has shown the magnitude and the importance of the work undertaken and accomplished by Columbanus and Gallus and a host of others, 'numerous as swarms of bees,' who, in the midst of innumerable difficulties, introduced agriculture and civilisation, learning and religion, into France and Switzerland and Italy and Germany, of which last country the English Bosworth became the 'father.' Nevertheless, the sort of Christianity then existing was non-existent at an earlier time. In France, for example, these noble missionaries had to do with the religion introduced by the Romans; but the pure faith was now represented by a corrupt clergy ministering to voluptuous natures or neglecting an enslaved people. Then they had to do with the recent invaders, who were partly heathen and partly Arian. Sad to say, the missionaries seem to have suffered less from the heathens than from the Arians, less from the Arians than from the orthodox, and less from the orthodox than from the nobles, and most of all from the clergy, or from others at their instigation.

What the Irish and Scots did for Europe in the middle ages the Nestorians about the same time attempted, with no less zeal, though with his successors the Copts and the Syrians, were scattered through central Asia, and founded churches, some of which exist in a flourishing condition to this day, whilst others recognised papal authority in the later mediaeval centuries. The Nestorian Tartar Church seems to have subsisted under a succession of ecclesiastics (see PESTER JOHN) until the country was devastated by Genghis Khan. The Nestorians either introduced the gospel into India, or else revived a church previously founded, possibly by the apostle Thomas. There can be no reasonable doubt that in the 7th century they passed through Tartary into China, that they once flourished there, and that they were at least tolerated and probably subsidised by successive emperors till the end of the 9th century, when, with a revolution or change of dynasty, the system of intolerance was introduced.

In the 16th and 17th centuries the missionary work was mainly in the hands of the great Roman orders, the Dominicans (q.v.) and the Franciscans (q.v.), especially the latter. Their work was chiefly among the Mussulmans of Spain, North Africa, and western Asia, Las Casas (q.v.) narrates in titillating detail over a third of a century the results of their labours (q.v.).

(c) Modern Missions.—The Jesuit order was formed immediately after the Reformation, avowedly for the purpose of retrieving the disaster which that great event had caused to the Church of Rome. By far the most distinguished of the early Jesuit missionaries was Francis Xavier (q.v.). Unquestionably Xavier was no ordinary man; it is, however, evident even from the eulogies passed on him by his admirers that he did not make any spiritual impression on the minds of the people of India and Japan, though he consolidated the Portuguese mission in India and helped to open China and Japan to missionary effort. After the labours of Ricci and Schall there are said to have been about 260,000 Catholics in 1662. For the Jesuit 18th-century missionary work in Paraguay, see JESUITS, PARAGUAY. Notes on the Catholic missions in Japan and Corea will be found in the articles on these countries. There is a separate article on the Propaganda (q.v.). The Missiones Catholicae states that the number of European missionaries belonging to the Roman Catholic Church in 1886 was 2,800, of mission adherents nearly 2,500,000; in India there being 1,180,000, in Indo-China over 500,000, nearly 300,000 in China, 210,000 in Africa, and over 160,000 in Oceania.

The Reformation was a great preparation for evangelistic work, but the Reformation period was not distinctively a missionary period. This was not merely, though it might be in part, because the hands of the Reformers were full of the work of the world. It is true, however, to be remembered that the nations which had foreign relations, foreign traffic, and foreign possessions were Spain and Portugal, in which the Reformation got no firm hold. But it must be admitted that the Reformers did not rightly bend the commission to preach the gospel to every creature. When Luther, therefore, has occasion to refer to that text, he tacitly assumes that its requirement was fulfilled when the gospel, as distinguished from Romanism, was preached to the nations of Europe. In the 16th and 17th centuries, therefore, we find no more than sporadic and ill-sustained efforts after mission-work among Jews or heathens. Leibnitz, indeed, anticipated the conception of a later age, and may well be regarded as the forerunner of modern missions, even as, along with Newton, he was the forerunner of modern science. It was natural that the needs of the English colonies should first attract the interest of Englishmen to foreign parts; the life labours of John Eliot, 'the Indian apostle' (1604-90), were carried out under the auspices of the Corporation for the Propagation of the Gospel in New England. The Hon. Robert Boyle, first governor of that society, contributed to the translation of the gospels into Malay, and left a bequest for foreign missions. Bishop Berkeley laboured for the foundation of a mission college in Bermuda; and it was mainly for the spiritual wants of the American colonies that the Society for the Propagation of the Gospel in Foreign Parts was founded in 1701; its first missionary to India sailed in 1818.

Early in the 18th century the first Protestant mission was sent to India. It was projected by the king of Denmark, having probably been suggested to him by his chaplain, Dr Løtken. At first, and for a long time, Germany supplied the missionaries; but the pecuniary support of the mission was devolved upon Queen Anne, the husband of Queen Anne, having recommended the object to the Society for Promoting Christian Knowledge. Among many noble men who have been engaged in this mission the most notable is Schwartz, who probably obtained an undying name by his labours among the people of India such as no other European ever possessed.

While all the Protestant churches of Europe and America are now engaged in missionary work, there is one church which is distinguished from all
the rest by this, that it is simply a missionary institute. Other churches make their missionary work subordinate to their pastoral functions; the Moravians or Unitas Fratrum have long regarded the missions in India and elsewhere as a part of their discipline. There is not in the history of human enterprise a more interesting chapter than that which relates the missionary works of the Moravians from their first beginnings in St Thomas and in Greenland to their latest undertaking in the Tibetan Himalayas.

To William Carey belongs the high distinction of having been the first to incite effectually upon British Protestants the duty and the privilege of missions, and the first English Protestant to engage personally in the work. He and his coadjutors were noble men, and had to contend not only with heathen prejudices, but also with the timid policy of the rulers of India. The battle which fell to them to fight had to be fought once for all; and it is due to their singular discretion and their inflexible determination that it was fought so well. These men made Scenierramore the classic spot, and amid all the changes, material and spiritual, which have come over India in these last years, and the greater changes which a near future will certainly effect, the names of Carey and Marshman and Ward will be held in everlasting remembrance in India.

Henry Martyn's labours lay between 1805 and 1812. In 1793 the London Missionary Society was formed, and began its work by the despatch to the South Seas of the ship Duff with a large body of missionaries. For a long time the mission was not very successful; but after a time it met with great success, and now there are many of the islands in which heathenism has long been extinct. The London society cordially welcomed numerous fellow-labourers from England, Scotland, Germany, and America, and most generously consented to a division of the islands which they could not have been much blamed if they had claimed as their own. It may be noted in passing that these small islands have contributed to a disproportional extent to the enrichment of missionary literature. It is part of the complexion of mankind that truth is stronger than fiction, but that the latter is generally more attractive. Yet in our day there have not appeared so many fascinating books as Williams's Missionary Enterprises, Miss Yonge's life of Bishop Patteson, and Mr Paton's narrative of his own work and that of his missionary society in the Sandwich Islands.

The societies of the Church of England are the Society for the Propagation of the Gospel, High Church (1701), and the Church Missionary Society (1799). The English Nonconformists are represented in the mission-field all over the world by agents of the London (1795), the Baptist (1792), and the Wesleyan Missionary Societies (1817). The Americans are not behind in the good work. The American Board of Missions (1810) and the American Presbyterian Board are great organisations, whose agents are doing most effective work in many fields; while the Baptists have been of good repute to rejoice in their Burmese Mission (1813). The Methodist Episcopal Church came more recently into the field (1819), but set about its work with characteristic energy. Zenana missions are a special department of Indian missions. The efforts of the Society for the Aborigines of the field of mention. Missions to the Jews have a peculiar interest for many Christians; and home missions are an integral part of church work at home.

The Evangelical body in Germany is, in proportion to its length, most creditably evangelistic. By means of many institutions they have trained and sent forth a large number of missionaries, some of whom have been men of extensive scholar

ship, but the greater proportion men of earnest piety, able and willing to endure hardship, as good soldiers of Jesus Christ. The Rationalistic party in Germany have not shown much zeal in the missionary work.

The Scottish missions differ from the others in this, that they are conducted by the churches as such, without the intervention of societies. The Established, the Free, and the United Presbyterian Churchs have extensive missions in India, Africa, America, China, and Japan. The English Presbyterian Church has an extensive and successful mission in China. The Presbyterian bodies cherish the memories of Duff and Wilson and Anderson in India, and of William Burns and Carstairs Douglas in China.

The following table, based on the calculations of the American Board, will give an idea of the extent of Christian missions (other than Roman Catholic) in 1890.

The Church Missionary Society's income is more than twice that of any other English society.

The mode of carrying on missionary operations by the various bodies is essentially one, though, of course, modified, of course, by circumstances. Of recent years 'medical missions' have been found to be a valuable, and in some cases an indispensable, adjunct to the other agencies. The missions of the Scottish churches have employed education as an evangelistic power to a greater extent than the other bodies, and such institutions as the Christian College at Madras, the mission station at Blantyre, and the Free Church Institution at Lovedale in South Africa are producing a great effect on the minds of the people.

The success of missionary work in our day is not such as either to elate or to discourage the friends of missions. The actual population of the world may be taken as fifteen hundred millions, of whom about four hundred millions are professedly Christians. Thus, not much as a third part of the world is evangelised. But then it should be remembered that in many countries the missionary work has been accomplished; and also that great national movements often reverse in a few years the aspect of affairs. In our own time we have seen such reversals in Madagascar and the Fiji Islands and Japan. In China we have seen a change, in the freedom with which the gospel can be preached, which our fathers, and indeed ourselves, at one time, would have considered simply impossible. All are convinced that in India there must come ere long a mighty change; and the friends of the gospel confidently hope that that change will be favourable to the cause of Christ.

Some account of mission operations are given in the articles on the countries where missions have had conspicuous success (FINN, JAPAN, &c.); there are also biographical notices of the most eminent missionaries (Elliot, Carey, and others). See also works on missions by Marshall (1863), Rufus Anderson (New York, 1889, i. Grandemann's Missionsatlas (Gotfa, 1857-80, and Caldw. 1884), Christlieb (2 ed. 1884, 3. Pommer (New York, 1881), P. Jooste (New York, 1883), Gaiskridt (2 ed. Caldw. 1886), Warncke (Eng. trans. by T. Smith, 1884), George Smith (1884; new ed. 1890), and on Catholic missions, Henriet's Histoire des Missions Catholiques, and Dupont's Missions Catholiques Francaises; works on special missions; the numerous missionary journals and year-books; and the lives of the notable
MISSISSIPPI

missionaries. Buddhism (q.v.), especially in its earliest periods, and Mahayana (q.v.), have been grouped with Christianity as missionary religions in the tradition of Judaism, Zoroastrianism, and Brahmanism. See Max-Müller's papers on missions in *Chips from a German Workshop*, vol. iv.

**Mississippi**, a state of the American Union bordering on the Gulf of Mexico, lies west of Alabama and south of Tennessee; and the Mississippi River. Length N. to S., 333 miles; width, 150 miles. Area, 46,810 sq. m. The surface, except in the Yazoo delta, is generally hilly, though nowhere mountainous; the highest hills being only 800 feet above sea-level. There are three distinct watersheds: the eastern contains the Tombigbee and its tributaries; the Pearl, Pascagoula, and Escatawpa with their affluent streams draining the central and south-eastern portion; and the Homochitto, Big Black, and Yazoo carry the water of the western and north-western parts into the Mississippi. The Orange-sand formation (Prest-Tertiary, 40 to 60 and even 200 feet thick) characterises the greater portion of the surface of the state, and forms the main body of the hills and ridges. It is usually coloured with hydrated peroxide of iron, or yellow ochre; and yellow-pine and scarlet cypress are its characteristic tints. Ferruginous sandstones, capping the tops of hills and thereby preventing denudation, are found in all sections covered by the Orange-sand formation. Gravel beds also abound, as well as beds of pipeclay, and of oolitic chays used for paint; and there are also vast beds of lignite of excellent quality, and marls which are used as ingredients of commercial fertilisers. There are mineral springs in different portions of the state. Mississippi is essentially an agricultural state. The chief cultivated crops are tobacco, corn, and cotton. The pine forests, which cover an area of 2,100,000 acres, and from 15 to 20 miles in length, with its fertile, black, calcareous soil, contains much of the best farming and grazing land in the state. There are no springs here, but cisterns dug in the rotten limestone, bored wells, and artesian wells furnish ample water. In the northern portion of the state the numerous creeks and rivers especially are well adapted to agriculture; while in the central portion stock raising is carried on, and in the yellow-pine region large herds of sheep are raised. The pine is the principal timber tree, and from 60 to 100 miles of railway in the state. Vicksburg, Greenville, and Natchez are principal ports on the Mississippi River, and Pascagoula and Biloxi on the Gulf. Cotton-factories are located at Wesson (value 3 millions), Columbus, Natchez, Enterprise, Meridian, Waterford, Carrolton, and Restina; and wood-factories at Jackson and Meridian. Pop. (1820) 73,448; (1880) 1,131,597; (1890) 1,280,690, or one-half of African blood; (1900) 1,551,570.

**Mississippi-Missouri**. The Mississippi River (Algonkin, *Miss Sippie*, signifying 'Great River') is the longest river of the United States, and is wholly within the boundaries of the United States. It drains most of the territory between the Rocky and Alleghany Mountains, extending an area of 1,267,434 sq. m., or more than two-fifths of the area of the United States. This basin includes the minor basins : Lower Mississippi, 65,646 sq. m.; Red River, 92,721; Arkansas, 184,742; Missouri, 327,600; Upper Mississippi, 179,635; Ohio, 307,111. There are 41 other navigable tributaries, and 290 more of moderate size. The total length of the Mississippi is 2,960 miles, of which 2161 are navigable; but the Missouri affluent is longer than the Upper Mississippi, and with the lower river aggregates 4200 miles, the longest river in the world, and in commercial facilities the greatest. The total volume of water at the mouth is 24,000,000 cubic feet per second. The source of the Mississippi is Lake Itasca in the north-west central part of Minnesota, about 7 miles long by 1 to 3 wide, which has, however, several feeders, the principal being Elk or Glazier Lake. The river has the name of the Wabash, 34° N. lat. and 95° 20' W. long., and are 1860 feet above sea-level. As it issues from this lake the Mississippi is about 12 feet wide and 18 inches deep. Through pine-forests and swamps for hundreds of miles it winds from lake to lake, with frequent rapids and picturesque falls, until, at 1200

Copyright 1899, 1897, and 1837 by W. & R. Lippsmoot Company.
feet wide, at the city of Minneapolis it plunges over the Falls of St. Anthony. This point is the head of river navigation, though in various reports it is referred to as the Falls of the St. Croix. The river, after receiving the St. Croix, the Mississippi becomes the boundary between the states of Minnesota, Iowa, Missouri, Arkansas, and Louisiana on the right, and Wisconsin, Illinois, Kentucky, Tennessee, and Mississippi on the left. Its frequent rapids, with the exception of the Jefferson, a great bed, but sandstone prevails farther down, to Rock Island, Illinois. On the Wisconsin boundary the river expands into Lake Pepin, and thereafter, fully a mile wide, flows between bluffs 200 and 300 feet high, and sometimes through dense forests. Rock Island, there are rapids about 22 feet of fall, and 125 miles farther down are the Des Moines rapids with 24 feet of fall. Around these obstructions to navigation the United States government has constructed ship-canals. The entrance of the turbid Missouri produces a marked change in the character of the river; for several miles the diverse waters refuse to mingle, the Missouri’s muddy tributate taking the right bank and the Upper Mississippi’s clear stream the left. When the union is complete, the whole river has henceforth a light-yellow color, more or less stained by the Ohio’s greenish water and more by the reddish water of the Arkansas and Red. From the mouth of the Ohio the trough of the Mississippi is about 4470 feet wide, but as it approaches the Red it is narrowed to 3000 feet, and at New Orleans is 2500 feet wide. The usual depth of the river southward from the Ohio is from 75 to 100 feet, and its surface is sometimes higher than the country beyond its banks. In fact, from the Missouri to the Gulf the Mississippi rolls in serpentine course through vast alluvial tracts or ‘bottoms,’ whose width varies from one to ten miles. Their varied areas, including those along tributary streams, is variously estimated from 29,790 to 41,193 sq. m. Though of unsurpassed fertility, scarcely one-tenth of these lands are cultivated owing to the dangers of the annual overflow. The melting of the ice and snow in the lower valley, swells the current from March to June. Levees or embankments, largely built by the government, now extend for more than 1600 miles. Between the Ohio and the Red rivers extraordinary floods, rising from 47 to 51 feet, occur about once in ten years, making ‘crawfishes’ common in the region. In these great floods the river has been known to spread over a tract of 150 miles. Below the Red River the waters are discharged through numerous ‘bayous’ into the Gulf of Mexico. The main channel runs south-eastward, and finally divides into five or six passes, the principal being the south, south-east, and south-east; the last is in 28° 53’ 7” N. lat., and 89° 10’ W. long.

The mean velocity of the Lower Mississippi is 24 miles per hour. The yearly discharge into the Gulf of Mexico is 143,000,000 cubic miles of water. The sediment carried with this would form a prism 1 mile square and 263 feet high, while the amount pushed along the bottom of the channel would make another 1 mile square and 27 feet high. These vast deposits and the constant changes caused by floods and tides, render navigation of the river very great. To keep an open channel, at least 20 feet deep, Captain Ends (q.v.) contracted with the United States government to erect and maintain a system of jetties at the South Pass. The construction was begun in 1875, and has proved highly successful, a deep channel has been kept open, with 20 feet of water throughout the year, and 18 feet in winter. The mouth of the Mississippi is essentially tideless. The principal cities on the great river are Minneapolis, St. Paul, La Crosse, Dubuque, Keokuk, Quincy, Hannibal, St. Louis, Memphis, and New Orleans, at several of which the river is crossed by railway bridges. Two of these have been constructed between St. Louis and St. Paul, and one was opened at Memphis in 1892.

See Humphreys & Abbot’s Physics and Hydraulics of the Mississippi River (Philadelphia, 1861), and Commerce and Navigation of the Mississippi (Washington, 1888).

MISSOURI RIVER (‘Big Muddy’), the principal branch of the Mississippi River, is formed by the confluence of the White and Missouri rivers, at Gallatin City, Montana, 4152 feet above the sea-level. These rivers rise in the Rocky Mountains, close to the sources of the Columbia and Colorado rivers, and to the Continental Divide. The Madison has the remotest source in a small lake of the same name in Yellowstone National Park in Wyoming, 44° 19’ N. lat., and 110° 50’ W. long., at an elevation of 7692 feet. This river flows north-west and north to the junction of the Three Forks. The Missouri then flows northward, skirting the main range of the Rocky Mountains, and, after passing through a gorge called ‘The Gate of the Mountains,’ turns to the north-east and reaches Fort Benton, the head of navigation, 225 miles from Gallatin City. About 40 miles above Fort Benton are the Great Falls, where the river descends 327 feet in 15 miles by a series of cataracts, the highest being 30 feet above the base. 87 feet. From Fort Benton the course is easterly, the river being flanked by bluffs a mile apart until it passes the rapids 400 miles below, when the valley opens to a width of 10 miles. The Milk River is its first large tributary, but at the mouth of the Milk Dakota, the Missouri joins it. The Yellowstone also rises in the National Park, and flows at first over cataracts and through canyons until it emerges in a more level country. It is 1152 miles long, and has the general characteristics of the Missouri. From its junction, which is the head of navigation in the low-water season, the Missouri flows through North Dakota, east and then south-east to Bismarck (1610 feet above sea-level), where it is crossed by the splendid bridge of the Northern Pacific Railroad. Through South Dakota the south-east course continues, and whence flowing south the river becomes the boundary between Nebraska and Kansas on the right and Iowa and Missouri on the left. On receiving the tributary Kansas the stream turns to the east, and flowing across the state of Kansas, the Missouri discharges into the Gulf of Mexico, 20 miles above St Louis. The Missouri is 3047 miles long, of which 2682 are called navigable, but owing to its tortuous, treacherous, and obstructed channel navigation is attended with great risks. The growing cities on its banks forsake the use of the river for commercial purposes and depend on the railways. In 1886 there were seventy-one steamers in active service in that part within the state of Missouri, but twenty years later the number had diminished to seven steamers and three tow-boats. The chief towns on the Missouri are Kansas City, Omaha, Council Bluffs, Nebraska City, St Joseph, Atchison, Leavenworth, and Kansas City.

Mississippi Scheme, projected in France by John Law (q.v.) of Louisiana in 1717, proposed to develop the resources of the province of Louisiana and the country bordering on the Mississippi. The company, incorporated as Compagnie des Indes Occidentales, started with a capital of 200,000,000 livres, and was under the direction of a French regent, who was to buy; and when, in 1719, the company obtained the monopoly of trading to the East Indies, China, the South Seas, and all the possessions of the French East India Company, the brilliant vision opened up to the public gaze was irresistible. The
MISSOURI

Mississippi, a channel state of the American Union, which for three decades of its history served as a recruiting ground for Negroes, and which yielded a number of distinguished statesmen, was a state in the section of the Union. The point of population lies between 36° and 40° 30' N. lat., and 89° and 95° 51' W. long., and occupies a commanding position in the Mississippi valley. The Missouri River rises about 800 miles to a station at St. Louis, and gradually increases in width from 205 miles in the north to 312 miles in the south. Area, 69,415 sq. m., or nearly that of Scotland, Ireland, and Wales. The Missouri River divides the state into two moat sections, designated "North Missouri" and "South Missouri." That part of the state lying north of the Missouri River is generally level or slightly undulating, consisting of rolling prairies and level bottom lands, diversified with a luxuriant growth of timber along the streams. The southern section has a more diversified surface, deriving its distinctive features from the Ozark Mountains, which cover about one-half of this division. These mountains enter the state from north-western Arkansas, and extend across the state; but the Missouri River separates the greater part of their length; they may very properly be classed as tablelands, reaching their highest altitude (1500 feet) in Greene and Webster counties, and gradually breaking up into narrow ridges, spurs, knobs, and peaks farther east. The entire eastern section of Missouri, except that part lying by the Mississippi River, with a water front of 560 miles, while the Missouri River forms the boundary from the extreme north-west corner to Kansas City, and thence across the state to the Mississippi, with which it unites just above St. Louis. Many small tributaries flow into these two majestic rivers—into the Mississippi the Fabius, Salt, Cuivre, Meramec, St Francis, Current, and Black; and into the Missouri the Nodaway, Platte, Grand, and Chariton on the north, and the Osage and Gasconade on the south. The climate of the state, which lies within the central continent, is continental, and varies with the altitude and exposure. The weather is generally clear and healthy. The annual mean temperature of the state is about 54°, and the mean annual rainfall is 41 inches.

Missouri is pre-eminently an agricultural state. Of the 44,000,000 acres of its land surface more than 42,000,000 are adapted to agricultural and horticultural purposes. The soils are rich, deep, and unsurpassed in variety and productiveness. The principal crops are Indian corn (200,000,000 bushels), oats (30,000,000 bushels), wheat (28,000,000 bushels), potatoes, rye, barley, hemp, flax, cotton, comfits, buckwheat, and hay (1,000,000 tons). Of tobacco a fair crop is 15,000,000 lb., and orchard products are grown in great abundance. In the decade 1890-99 there was a great increase in the number of grazing animals, though sheep are not largely raised. The immense quantities of dressed beef and pork shipped annually by home and foreign markets are constantly increasing.

The mineral resources of Missouri are exceedingly rich, comprising extensive coalfields, that cover more than 20,000 sq. m.; also vast deposits of iron ore, lead, and zinc; while copper, cobalt, nickel, fireclays, fine marble, granite, and limestones of excellent quality abound in different localities. The coalfields are capable of yielding 100,000 tons of bituminous coal a day for several thousand years; the actual product for the decade 1897-1897 averaged about 42,000,000 long tons. The supply of excellent iron ore is inexhaustible. The iron belt south of the Missouri River and extending from the Mississippi River on the east to the Osage River on the west has an area of 25,000 sq. m.; but the richest deposits worked are those in Iron and St Francois counties in the south-east. In 1897-98 25,000 long tons were raised. The Missouri River on the eastern border and the Missouri across the state afford excellent transportation facilities; the railroads aggregated 8649 miles in 1897.

a larger permanent school fund than any other state of the American Union. The corps of teachers number 15,000. In addition to the state system of education there are 30 private academies, seminaries, denominational colleges, and universities, several of which are of a high order of excellence.

The metropolis of Missouri is St Louis (pop. 190,546, 1860), one of the greatest railroad, manufacturing, and commercial centres in the country. It is the seat of the University of Missouri, the Western Medical College, and the Agricultural College. The University was founded in 1839, and has an endowment of more than $1,500,000.

History.—The State was first explored by De Soto in 1541-42, and in 1675 Marquette and his followers visited its eastern border. It formed part of the 'Louisiana Purchase' (see LOUISIANA), the northern portion of which was organised as the 'District of Louisiana.' It was not till 1812 that a part of this territory took the name of Missouri. In 1821 Missouri was admitted into the Union, but the present limits of the state were not established till 1838. Its admission was preceded by a long and bitter struggle. Between the representatives of the North and South, the former resisting its entrance as a slave-state.

The discussion resulted in the famous 'Missouri Compromise,' under which it was agreed that slavery should be for ever excluded from all that part of the territory of 36° N. of the parallel of 36° (Boonville, Kansas, 1880), the parallel of 36°, was to be held in common by the two sections, and that in Missouri, until the year 1850, a line should be run from the western boundary of the State, through the centre of the Missouri River, dividing the territory into two parts, to be held by the North and South respectively.

The State of Missouri was divided into two parts by the Missouri River, and the line was run through it, dividing the territory into two parts, to be held by the North and South respectively.

a dangerous tumult among the waters of the Mediterranean. The mists, blows, at intervals, with its greatest force from the end of autumn to the beginning of winter.

MISTRAL, Frederick, Provençal poet, was born a peasant's son near Maillane (dept. Bouches-du-Rhône), on 8th September 1830, and studied law at Avignon; but for law he had no liking and went home to work on the land and write poetry, as Burns did in Scotland. In 1859 he published his epic, *viticte* (7th ed. 1884; Eng. trans. 1890), written in his native Provençal dialect. This charming representation of life in southern France made Mistral's name famous throughout the country, and gained for him the poet's prize of the French Academy and the cross of the Legion of Honour. It also led to the formation of the society called Lou Feliçrige, which set itself to create a modern Provençal literature. In 1867 Mistral published a second epic, *Calendou*, and in 1876 a volume of poems entitled *Las Isol de'or (Golden Islands)*, songs steeped in the golden sunshine of the Mediterranean and its vine-clad shores. Since then he has written a novel, *Nerto* (2d ed. 1884), and issued a dictionary of the Provençal dialect (2 vols. 1875–86), the preparation of which occupied him many years. See an article by A. Daudet in the *Century* (1885).

Mistretta, a town of Sicily, near the north coast, midway between Palermo and Messina. Pop. 12,925.

MITAN, the capital of the Russian government of Courland, on the right bank of the As, 27 miles by rail SW. of Riga. Founded in 1271 by the grand-master of the Teutonic Knights, and annexed to Russia in 1772, it has a castle, begun by Biron in 1738, and now used as a seat of the governor of the province, six churches, a museum, &c., with some very important manufactures, and a trade in grain and timber. From 1798 to 1807 Mitan offered an asylum to Louis XVIII. Pop. 29,015, of whom more than one-half are Germans, and nearly a fourth Jews.

Mitcham, a village of Surrey, 8½ miles by rail SW. of Victoria Station, London, and half-way between Wimbledon and Croydon (3 miles from each), lies in the centre of a district in which flowers and aromatic herbs (roses, lavender, camomile, etc.) are largely grown.

Mitchel, John, an Irish patriot, was born the son of a Presbyterian minister at Dungiven in County Derry, 31st November 1815. He studied at Trinity College, Dublin, and practised several years as an attorney at Banbridge. Soon after the formation of the Young Ireland party, and the starting of the Nation in 1842, Mitchel began to contribute, and after the death of Thomas Davis in 1845 he became assistant-editor. But his language was too violent for the paper, and three years later he started the *United Irishman*, for his articles in which he charged the administration for its measures and sentenced to fourteen years' transportation. He was sent to Bermuda, and next to Van Diemen's Land, whence he made his escape to the United States in the summer of 1853. In New York he published his *Jail Journal, or Five Years in British Prisons* (1854). Next followed a series of short-lived newspapers, the *Citizen*, the *Southern Citizen*, the *Richmond Inquirer*, and the *Irish Citizen*, which cost him the confidence of many of his American friends by its enthusiastic defence of slavery and the South. In 1854 he returned un molested to Ireland, was elected to parliament for Tipperary, but declared ineligible. Again elected, he died at Cork, 20th March 1875.

Of his books may be mentioned *A Life of Hugh O'Neil, Prince of Ulster* (1845); and *History of Ireland from the Treaty of Limerick* (1868); besides editions of the poems of Thomas Davis (1856) and James C. Mangum (1859). See the Life of him by William Dillon (2 vols. 1886).

Mitchell, capital of Davison county, South Dakota, 70 miles by rail W. of Sioux Falls, has a foundry and machine-shop, flour-mills, packing-house, &c. Pop. 4635.

Mitchell, Donald Grant, an American author, many of whose works have appeared under the pen-name of 'I. k. Marvel,' was born in Norwich, Connecticut, 12th April 1822, was in 1833 appointed consul at Venice, in 1838–69 editor of the *Atlantic Monthly*, but is better known as the proprietor of a farm—Edgewood—near New Haven, about which he has written several delightful books. Among his other works are *Recreations of a Bachelor* and *Dream Life* (1850–51; new eds. 1889); a novel, *Dr John* (1860); and *English Landes, Letters, and Kings, from Celt to Tudor* (1889).

Mitcheltown, a market-town of County Cork, Ireland, 11 miles N. of Fermoy, became for a time a familiar name in the political war-ery 'Remember Mitchelltown.' On 9th November 1857, a Nationalist meeting, the people refused to allow the government shorthand-writer to address the speakers. The police endeavoured to make a way for him, but were resisted by the crowd. A riot ensued, on which the police fired, and two men were shot. In the immediate vicinity of the town is Mitcheltown Castle, the mansion of the Earls of Kingston, and 7½ miles to the northeast there are extensive stalagmite caves, discovered in 1853. Pop. 2367.

Mite, see Acarina, Cheese-mite.

Mitford, Mary Russell, born at Alresford, Hants, 10th December 1877, was the only child of a physiocratic family, extremely wealthy, of several fortunes, and always in debt. A few years after his marriage he moved to Lyme Regis, and thence to London. On Mary's tenth birthday he took her to a lottery office, and bought her a ticket. She chose a particular number which drew a prize of £200,000. While this money lasted she was sent to a good school in Chelsea, and Dr Mitford built himself a large house near Reading. Here Mary returned when she was fifteen, a clever, accomplished girl, devoted to her parents, a great reader, and fond of gardening. Her first volume of poems appeared in 1810, and was followed in 1811 and 1812 by two other poems. In 1820, as the family became more and more impoverished, they were obliged to move to a cottage at Three Mile Cross, near Reading, and at length the need came for Miss Mitford to write to earn money. She wrote for magazines, and plays for the stage. Four of her tragedies, *Juliet*, *The Foesar*, *Rienzi*, and *Charles I.* were acted; the three first met with success, but they have not kept the stage. Her true line was describing what she saw around her in a series of sketches of country manners, scenery, and character. These little essays were rejected by several London editors, but at length found a place in the *London Magazine*, and were published in a collected form in 1824 under the name of *Our Village*, the series of five volumes being completed in 1832. You would think, as they read this 'playful prose,' with what toil and anxiety it was written. Dr Mitford died in 1842, leaving his affairs in such a state that a subscription was started to enable his daughter to pay his debts; which was soon followed by a pension from the crown. In 1851 Miss Mitford moved to a cottage in Swallowfield, a village close by, where she spent the rest of her life. In 1852 she published *Recollections of a Literary Life*, and in 1854 a novel, *Atherton*, and other Tales. She died 10th January 1865, and was buried at Swallowfield. Her sketches are
MITHRIDATES

Mithridates, or Mithra, a Perso-Iranian divinity, whose worship, after passing through several changes and transformations, spread itself for a time far beyond the limits of its native seat. In the Zendavesta, or sacred writings of the ancient Persians, Mithras appears as chief of the Izeds or good genii, the god of the heavenly light and the lord of all countries. Protector and supporter of man in his life, he guards over his soul in the next, defending it against the spirits of evil. In the dualism of Zoroaster he figures as an invincible hero on the side of the principle of good, Ahura Mazda or Ormuzd, in his eternal struggle with his rival Angra-Mainyu or Abriman. At this stage the religion of Mithras had only a moral signification. Afterwards, as the political power of the Persians increased and their religion grew, by the natural processes of development and absorption, more ritualistic and composite, Mithras became the sun-god and was re-presented under the name of the Ormuzd, from whose shoulders was sloughed his name. By degrees his importance increased till he had scarcely a rival in the Persian pantheon. Unfortunately, owing to the almost entire destruction of the early religious literature of the East by the fanaticism of the followers of Muhammad, our knowledge of Mithraism as the dominant religion of its day is indirect and vague. Too great reliance is not to be placed on the speculations in which some modern writers such as Lajard indulge regarding it. But it would seem to have been, in its ultimate form at least, a system of secret rites and mysteries. For admission to these the aspirant was prepared by a series of trials of a severe description. He then underwent initiation, which, when duly and completely performed, comprised seven, or according to others twelve, degrees or successive steps, symbolically marked by striated columns, batons, palm, and the partaking of a mystical liquid, consisting of flour and water, to be drunk with the utterance of sacred formulas, are also said to have been among the inculcative acts. Most of the ceremonies thus described, which the level mind had thus to pass were of an extraordinary and even dangerous character. In spite, however, of all this rigour, Mithraism must have had attractions of no ordinary kind. Introduced into Rome in 68 B.C. by some Cilician pirates whom Pompey had captured and whose national religion it was, it rapidly spread through the western parts of the Empire. The curious Taurian tablets sculptured in low-relief on the most interesting of its monuments that have come down to our time. There is a fine example in the British Museum, and others are to be seen in the principal museums of Europe. Mithraism now appears as a beautiful and harmonious Persian garb, kneeling upon a bull, with whose neck it is clasped by a dagger. Surrounding the group are various emblems, a scorpion, a serpent, a dog, a raven, a crescent, and others, to which an astronomical or an allegorical meaning has been variously assigned. The references in the police roll were often the scene of this sacrifice of the bull; but it was also performed in small temples or Mithraeums, one of the most perfect of which was discovered in Ostia by the Cavaliere Lanciani (see Athenaeum, Nov. 6, 1886). The floor and walls of this chapel are covered with representations of the twelve Signs of the zodiac, and the course of the planets, and containing allusions to the rites of Mithras. Tablets found at Housesteads in the Roman wall and at York are proof of the presence of Mithraism in Britain, to which it had doubtless been brought by the legions. The rite associated with Mithras, the cult of the sun, was united with Christianity, it was formally suppressed by the prefect Gracchus 378 A.D., though St. Jerome speaks of it as being still practised in his time.

Mitford, William, was born in London, 10th February 1744, entered Queen's College, Oxford, but left without a degree. In 1761 he succeeded to the family estate of Exbury near the New Forest, and in 1769 became a captain in the South Hampshire Militia, of which Gibson was then major. By Gibson's advice he was induced to undertake his History of Greece (5 vols. 1784—1818). It is a pugnacious, optimistic, one-sided, and even fanatical production. The author is an intense hater of democracy, and can see in Philip of Macedon nothing but a great statesman, in Demosthenes nothing but a noisy demagogue. Yet his zeal, which so often led him astray, also urged him, for the very purpose of substantiating his views, to search more minutely and critically than his predecessors into certain portions of Greek history, and the result was that Mitford's work has in some respects been more useful than the original sources down to the appearance of Thirlwall and Grote. He sat in parliament from 1783 to 1818, and died at Exbury, 5th February 1827.

See the Memoir prefixed to the 7th edition of his History (1838), by his brother John Freeman Mitford (1745—1810), who, with his friend Sir William Davies, revised the work for the 10th edition (1882). See also Montfaucon, L'Antiquité Expliquée (Paris, 1719); Hammer-Purgstall, Mithraeaca ou les Mithraiques (1832); Wellbeloved, Akhemen (York, 1842); Lajard, Recreations sur le Culte Public et les Mystères de Mithra (atlas of plates in 1817, letterpress not till 1867); Windischmann, Mithra (1837).

Mithridates (more properly Mithradates; Persian, 'given by Mithra'), the name of several kings of Pontus, Armenia, and Armenia, of whom have sunk into insignificance, with the exception of Mithridates VI. of Pontus, surnamed Eupator, but more generally known as Mithridates the Great. He succeeded his father, probably about 120 B.C., while under thirteen years of age, and soon after the death of his sister Eurydice he subdued Enuaxe as far as the Chersonesus Taurica (Crimea). The jealous behaviour of the Romans, and the promptings of his own ambitious spirit, now incited him to invade Cappadocia and Bithynia, but a wholesome fear of the power of the great republic induced his adversaries to offer him a truce at his own terms. The obnoxious Mithridatic War was commenced by the king of Bithynia (88 B.C.), who, at the instigation of the Romans, invaded Pontus. The generals of Mithridates repeatedly defeated the Asiatic levies of the Romans, and he himself took possession of Bithynia, Cappadocia, Phrygia, and the Roman possessions in Asia Minor. He also sent three powerful armies to aid the Greeks. He was, however, driven by Per- garus (85 B.C.) by Flavius Fimbria, and reduced to the necessity of making peace with Sulla, relinquishing all his conquests in Asia, giving up 70 war-galleys to the Romans, and paying 2000 talents. The wanton aggressions of Murena, the Roman legate, gave rise to the Second Mithridatic War (88—81 B.C.), in which Mithridates was wholly unsuccessful. In 74 B.C. he invaded Bithynia, commencing the Third Mithridatic War. He obtained the services of Tigranes of Armenia (72 B.C.), who was his ally and arms were at first prosperous; but afterwards the Roman consul Lucullus compelled him to take refuge with Tigranes of Armenia (72 B.C.). Lucullus then conquered Pontus, defeated Tigranes (69 B.C.) at Tigranocerta, captured Sardis, and took Bithynia and Armenia (68 B.C.). Mithridates, however, recovered possession of Pontus. After
the war had lingered for some time, Pompey completed
the work of Lucullus (66 B.C.), defeating Mithridates on the
Euphrates, and compelling him to flee to his territories on the
Cimmerian Bosporus. Here his indomitable spirit prompted him to
form a new scheme of vengeance, which was, however,
frustrated by the rebellion of his son, Pharnaces,
who besieged him in Panticapæum. Deeming his
case hopeless, Mithridates put an end to his own
life (63 B.C.). Mithridates was a specimen of the
two eastern despot, possessing great ability and
extraordinary energy and perseverance. He had
received a Greek education at Sinoe, is said to
have spoken the twenty-two languages and
dialects of his subject-peoples, and made a great
collection of pictures, statuæ, and engraved gems.

Mitrailleuse. See MACHINE GUNS

Mitrail Valve. See HEART.

Mitre (Lat. mitra, also inf. mitula), the head-dress
worn by bishops in solemn church services. The
name, as probably the ornament itself, is borrowed
from the orientals, although, in its present form,
it is not in use in the Greek Church, or in any
diocese of the Roman Catholic Church. In the
western world the mitre is a tall, tongue-shaped
hat, terminating in a twofold point, which is sup-
posed to symbolise the 'twelve tongues,' in the
form of the Holy Ghost, as worn and used by the
episcopal Church. The Holy Ghost was imparted to
the apostles, and is furnished with two flaps, which fall behind over the
shoulders. Opinion is much divided as to the date at which the mitre first
came into use. Enzelins, Gregory of
Nazianzus, Epiphanus, and others speak of an ornamented head-dress,
worn in the church; but the first mitre does not
seem to have been known till the 12th century.
The material used in the manufacture of the mitre
is very various, often consisting of most costly stuffs, studded with gold and precious stones.
The mitre of the pope is of quite a different form, and is called the 'pietra
viva.' As the mitre is of the mitre properly belongs to bishops only, its use
has been permitted by special privilege to certain abbots, to provosts of some distinguished cathedral
chapters, and to a few other dignitaries.

In the English Church, since the Reformation, the mitre was no longer a part of the episcopal
costume till 1833, when it was resumed by the
Bishop of Lincoln; but it is placed over the
mitre of an archbishop or bishop, instead of a crest. The
Bishops of Durham surround their mitre with a
decal coronet, in consequence of their having been	ill 1836 Counts Palatine of Durham.

Mitscherlich, Eilhard, chemist, was born at
Neunende, near Jever in Oldenburg, Germany, on
7th January 1794, and died at Schöneck near
Berlin on 28th August 1863. At the university of
Heidelberg (1811-13) he devoted himself to phil-
ology, especially to Persian. At this time of his
life his ambition was to go to Paris, and for this
end he visited Paris and began to study medicine
in Göttingen after 1814. But whilst studying
medicine, his deepest interest was arrested by the
sciences of geology and mineralogy, chemistry and
physics. Work in the Berlin laboratory in 1818
led him to discover the law of Isomorphism (q.v.).
Berzelius invited the young chemist to Stockholm
(1820), from which city he returned (1822) to fill
the chair of Chemistry at Berlin. One of his
earliest discoveries after his appointment was that of
the double crystalline form of sulphur, one of
the first observed cases of Dimorphism (q.v.). His
investigations regarding the production of artificial
minerals, and his memoirs on gemmens, and the
formation of ether, must also be noted. His princi-
pal work is Lehrbuch der Chemie (2 vols. 1829-35;
4th ed. 1840-48; 6th begun in 1853, but not com-
pleted). See Memoir by Rose (Berlin, 1861).

Mittweida, a town of Saxony, 11 miles by rail
N. by E. of Chemnitz, has an engineers' and a
weavers' school, and manufactures linen, woollen,
and cotton goods. Pop. (1890) 11,298.

Mitylene. See LESBOS.

Mivart, St. George, F.R.S., born 1827, was
educated for the bar, but devoted himself to
the biological sciences. In 1874-84 he acted as
professor of Zoology and Biology at the Roman
Catholic University College in Kensington, and in
1890 was appointed to the chair of Philosophy of
Natural History at Louvain. He was an able and
seems to have been the 'father' of 'recollection' theory. Among his works are The Genesis of Species (1871),
Man and Ages (1873), Contemporary Evolution (1874),
Lessons from Nature (1876), The Cod (1881), Nature
and Thought (1883), The Origin of Human Reason
(1889), Bishop Mitis, Types of Animal Life (1889),
Introduction to the Elements of Science (1894). He
died 1st April 1900.

Mixed Marriages. See MARRIAGE, p. 68.

Mizen, the sternmost of the masts in a thrее-
masted vessel. See SHIPBUILDING.

Mnemonics (Gr. mnēmēn, 'mindful'), the art of
assisting the memory. Even ordinary recollec-
tion, according to Cicero, is not purely spontaneous
or natural, but has some element of artificial
suggestion, something to prompt the mind. To recall
the future, the past, or figures of the present
with something else which is more to our hand;
and afterwards the mental reproduction or actual
presentation of the latter will give a suggestion of the
former, in accordance with the psychological
'law of contiguity.' The number is 2415856360
that which would require a mnemonic system, relie-
ged by the number of its letters, a corresponding figure of the
ratio to be remembered. What association
has the date 871 with King Alfred? None what-
ever, directly; but if those digits immediately appear as am
by a scheme which the pupil has already accepted or invented, then a clue or link
word is furnished to serve for a lifetime: a = 8,
m = 7, i = 1. Of the surface of our globe 734
thousandths is water, and by the same mnemo-
techy 734 becomes mer, so that the fact is per-
manently registered for ready use. The earth's
diameter and circumference measure 7926
and 24,900 respectively, which numbers to that mnemo-
technist read masts and 1ra, suggesting the phrase
'minutes turn' and the association that time is
measured by the earth's rotation. The list
bifon, jounou, chou, gounj, in a grammar is
another familiar instance where recollection would to many be impossible
without some artificial association. The following
serves that purpose by stringing the words to-
gether—'Finding a jewel in the garden, he made a
tou of it, and just singing about him picked a
coabbage and hurt his knee on a fintel, whilst the owl
overhead hooted derisively.' Some rhythmical
mnemotechnic contrivances have been used for ages:
one, for example, which, notwithstanding
the enormous multiplication of printed calendars, still
survives is—'Thirty days hath September, &c.'
The Latin student is thankful for the mnemonic rhyme

In March, July, October, May,
The idea are on the fifteenth day,
As they are on the seventh,
The rest thirteenth and fifth away;

and for centuries no text-book on logic has omitted the five hexameter lines (Barbara, Celar-ent, &c.) which compress the doctrine of the xylologism into a marvellous minimum of space. In this, however, as well as in the case of those numberless Latin verses over which so much time was till recently spent in our grammar-schools, the only help afforded is from the association of the sounds of certain barbarous dactyls and spondees in the ear. The perfection of mnemotechny is when there is not only a natural or artificial faculty, but a sense or natural suggestiveness. The thought of A will frequently bring Z to the mind sooner than B, because there is something not only not similar but grotesquely dissimilar in the ideas they awaken. Whoever practises the art of memory with success at all, has learned to utilise the tendency of the mind to the inertia of storing and then utilising their knowledge. The art is, however, to be distinguished from the general faculty—memory, which is the essential and distinctive faculty of 'mind.' As such it depends not only on attention (as philosophers have ever taught), but on the healthy action of the nervous system and general physique, assisted perhaps in some individuals by a certain plastic and assimilative brain-power. Cicero approved of the art of artificial memory, and probably applied the topical method (to be mentioned presently) in some of his elaborate speeches; but Quintilian implies (Inst. xi. 2, 40) that to remember a subject properly we must master it in all its details. Practice and labour, he affirms, constitute the real mnemotechny: the best method of learning much by heart is by long, and if possible, daily study. The aim in such a method however, was widely different from that which is now generally sought by using artificial memory.

The topical mnemonics (Gr. topas, 'place') of the ancients is adapted for recalling in order the arguments and illustrations of a public speech, or the several portions of battles or poems. With the Roman writers, it is referred to by Plato and Aristotle, and was attributed to Simonides the Greek poet, who died 409 B.C. The speaker having selected, for example, a house with which he is so familiar as to remember well the position, not only of each room and passage, but of all the prominent objects in every room, associates as vividly as possible the introduction of his discourse with the entrance-hall, and systematically assigns thought after thought to the chief points there visible. The first main division of his subject may then be identified, as it were, with the dining-room; and every piece of furniture, every picture, &c., be judiciously utilised for recalling the succession of arguments with their illustrations and results. The second main division may then be associated in like manner with the sitting-room, and everything in it if need be; and thus for the rest of his discourse till the successive rooms, statues, and windows, &c. are pressed into service, and all the series of his thoughts passed under review. The principle is that to recall a series of ideas they can be associated with each other with familiar (and, as it were, visible) objects or places than with each other. Another form of topical mnemonotechny was based on imagining the four walls of each room, and its floor, to be each divided into nine places, and a distinct object—such as a particular bust, picture, or tree, &c.—to be inseparably associated with each place. When these objects are all thoroughly known so as to be promptly and faultlessly recalled, then the mnemonotechnist has all in succession of things to be remembered assigns them to a particular room and compels himself to detect some association, no matter how incongruous, between each of them and one of the 'hieroglyphs' which are used as memory links.

Many minor systems for learning dates and detached numbers have been based on that of Gregor von Feinaigle, a German who lectured in London, 1811. His scheme was

each letter was more or less suggestive of the figure which it represents: moreover, p may be supplanted by f, k by c or g, and b by w or v, &c. Thus, as an example, the Anglian kinglist from the Humber to the Firth of Forth was founded in 547, and by Feinaigle's scheme that date becomes ltrk. By inserting vowels we form the mnemonic words lark, lurk, large, lyric, Alaric, &c., any one of which the historical student may choose to suit the situation; the insertion of arbitrary vowels, and is therefore not so elastic:

A recent mnemonotechnist, Dr Pick, has improved Feinaigle's method by introducing a principle not unlike that which we have noted in describing the topical systems. Given a list of detached words—e.g. 'garden, hair, watchman, philosophy,' &c.—they can be recalled in order by inserting between each pair a connective word which links them or forms a bridge. Thus, garden, maidenhair fern; hair, bonnet; watchman, wake, study; philosophy, &c. Other forms of mnemonotechny include those of Grey, 1730; Aimé Paris, 1833; Karl Otto, 1840; Conr. and Reid, 1845; and Loisette. Grey's system was really a modification of that of Winckelmann, which attracted the notice of Leibnitz and gave him the suggestion of a universal alphabet.

Mnemosyne, in Greek Mythology, the daughter of Uranus, and mother of the nine Muses by Zeus. The principal seat of her worship was at Eleutheria, in Boeotia.

Moa (Dinornis, 'monstrous bird'), the name given by the Maoris to a genus of extinct ostrich-like birds that inhabited New Zealand and, to a less extent, Australia. It is supposed that none has been seen alive since about the middle of the 18th century, but the Maoris have many traditions relating to them, and mon-hunting was a recognised sport. Their bones have been found in great numbers imbedded in the sands of the shore, and of lakes, swamps, and river-beds. A few remains of eggs have also been found, and nearly complete one containing a young bird, the eggs were about 10 inches long and 7 broad. Feathers and a part of the neck with muscles and skin attached have been discovered. There were several species of various size, the smallest about 2 feet, the largest about 14 feet in height. Their chief peculiarity was the entire absence of wings, not even the smallest rudiments having been found; associated with this
was the great size and weight of the legs, the bones of which and of the toes were in one species almost elephantine. There was an allied genus of Palae-teryx which possessed the rudiments of wings and a fourth toe, which was absent in mon. They are most nearly represented at present by the genus Ap-teryx, whose relative size may be seen in the figure.

Moabites, a pastoral people, who inhabited the bleak and mountainous country east of the lower part of the Jordan and of the Dead Sea, divided into two portions by the deep bed of the Arnon. Their capitals were Ar-Moab and Kir-Moab, both south of the Arnon, but their kings often resided in their native places, as Mesha in Dibon. Their sovereign divinity was Chemosh, and patriarchism was an essential part of their religion. They were ethnologically cognate with the Hebrews, and were compelled to become tributary to David, but about 850 B.C. shook off their allegiance to the Jewish kings, and afterwards took part with the Chaldeans against the Jews. Their name no longer exists, and the remnants of the people have long been included among the Arabs. The most striking feature about the country in modern times is the immense number of rude stone monuments with which it is covered. Major Conder found no fewer than a thousand of these, the various dolmens, menhirs, circles, and alignments familiar in the British Isles and Brittany, occurring in distinct centres, usually with a cairn at the top of the nearest hill. He rejects the sepulchre theory, and believes the dolmens to have been altars. Menhirs were anciently objects of worship, anointed with oil, or smeared with blood, and such a series of alignments and scattered stones as those of El-Mareighät may be supposed to be offerings of pilgrims to this shrine. For the so-called Moabite pottery, which Shapira succeeded in selling to the German government for nearly £3000, see an account by M. Clermont-Ganneau, who detected the imposture, in Les Fraudes archéologiques en Paléstine (1885); see also Conder's Heth and Moab: Explorations in 1881-83 (1883).

**MOABITE STONE**, a stone bearing an inscription of thirty-four lines in Hebrew-Phoenician letters, was discovered by the Rev. F. Klein in 1868 among the ruins of Dhib‘én, the ancient Dibon. The stone was of black basalt, rounded at the top and bottom, 2 feet broad, 3 feet 10 inches high, and 14 inches in thickness, but was unfortunately broken up by the Arabs, whose cupidity had been aroused by the indiscriminate eagerness to acquire it shown by M. Clermont-Ganneau. The fragments were afterwards collected and laboriously fitted into their proper places by means of imperfect squences made before the stone was broken, and the monument now stands in the Louvre at Paris. The inscription was discovered to be a record of Mesha, king of Moab, mentioned in 2 Kings, iii., referring to his successful revolt against the king of Israel. The characters of the inscription are Phoenician (see ALPHABET), and form a link between those of the Final Lebanon inscription (10th century) and those of the Siculoan text.

See Dr Ginsburg's Moabite Stone (2d ed. 1871); Héron de Villefosse's monograph Notice des Monuments provenants de la Palestine (1876), contains a bibliography of books and papers written on this subject. Readings are given by Clermont-Ganneau in the Revue Critique for 1875, by Profs. H. Smend and A. Soem of Tübingen in their monograph, Die Inschriften des Königs Mesch von Moab für Akademische Vorträge (Freiburg, i. B., 1886), and by Dr A. Neubauer in Records of the Past (new series, vol. ii. 1889).

**Moheyler.** A city of Randolph county, Missouri, 148 miles by rail WNW. of St Louis, is an important railway junction, and the depot of a rich coal country. It has large railway-shops, repair-walks, and foundries. Pop. (1900) 8012.

**Mobile.** The principal city and only seaport of Alabama, is situated on the west side of Mobile River, and is on Mobile Bay, which opens into the Gulf of Mexico, and is defended by Fort Morgan. It is 141 miles by rail ENE. of New Orleans, and is built with broad shaded streets on a sandy plain, rising gradually from the river. It has a fine custom-house and post-office (1854), a city hall and market-houses (1857), a Roman Catholic cathedral and over thirty other churches, several asylums and hospitals, a medical college, a Jesuit college, and a convent and school. Mobile contains

**MOBILE** 241

The Moabite Stone.

MOBILIER

MOCKING-BIRD

a floating dry-dock and several shipyards, foundries, cotton and cottonseed-oil mills, a tannery, a manufactory of chewing-gum, numerous tobacco factories, etc. Before the war the chief business was the export of cotton; but since then this trade has shrunk almost to one-third of its former proportions, while the export of timber has increased. Mobile was settled by the French in 1702, and was a Spanish, and later an American, city. The population shows traces of this Latin origin. In 1879 the city limits were curtailed somewhat. Pop. (1870) 32,034; (1890) 31,076; (1900) 38,499.

MOBILIER, CRÉDIT. On the 18th November 1852 the French government sanctioned the statutes of a new bank under the name of the Société Générale de Crédit Mobilier. The name was intended as a contrast to the Société de Crédit Foncier (see CRÉDIT FONCIER), which are of the nature of land banks, and advance money on the security of real or immovable property; while the Crédit Mobilier proposed to give similar aid to the owners of movable property. The declared object of this new company was to undertake industries of all kinds, such as the construction of railways, sinking of mines, etc. Various privileges were conferred upon it under its charter; in especial, it was allowed to acquire shares in public companies, and to pay the calls made upon it in respect of such shares in the same order as other holders were also to sell or give in security all shares thus acquired. The operations of the society were conducted upon a very extensive scale. In 1854 it subscribed largely to the government loan on account of the Russian war, to the Grand Central Railway Company, to the General Omnium Company, to a company of Paris, and to various other important undertakings. The dividend for this year was 12 per cent. In 1855 it lent two sums to the government—the one of 250 and the other of 375 millions of francs. Its operations were vast during this year, and the dividends declared amounted to 40 per cent. The directors had not hitherto availed themselves of their privilege of issuing their own obligations, but this they now resolved on doing. They proposed to issue two kinds—the one at short dates, the other at long dates, and redeemable by instalments. The proposed issue was to amount to 240 millions of francs, but the public became alarmed at the prospect of so vast an issue of bonds, so that, in March 1856, the French government deemed it necessary to prohibit the carrying out of the proposed scheme. This was a severe blow to the institution. In 1856 its dividends did not exceed 22 per cent.; in 1857 they were only 5 per cent. Several attempts had been made to resuscitate its credit, but failed. On 12th November 1871 it was reorganised, the assets of the first society being reported at 48 million francs. In 1875 the capital was reduced from 80 millions to 32, and in 1879 raised again to 40 millions. Another reduction of capital was made in 1884—30 million francs.—On the model of the Crédit Mobilier, companies were organised in England, Holland, America, and elsewhere. The Crédit Mobilier, Limited, was established in London on 29th March 1864. It amalgamated on 30th September of the same year with the Crédit Foncier as the Crédit Foncier and Mobilier of England, Limited; and on the reorganisation of that company in 1893 the name was changed to the latter. The Crédit Mobilier has undoubtedly been useful, but its operations have been hazardous, public advantages being gained at the expense of private losses.

MOBILISATION, a word for the act of making an army ready for taking the field. The process consists in bringing the various units to war strength by calling in reserve men, in organising the staff of brigades, divisions, and army corps, constituting the commissariat, medical, and transport services, and in accumulating provisions and munitions. As the work of mobilising an army causes great and inevitable expense, it is only resorted to when hostilities appear imminent.

Moccasin, the shoe of the North American Indian, made all of soft hide, and often ornamented. The Moccasin Snake (Tessarophis piscivorus) of North America is a brown-coloured poisonous swamp snake; the skin is marked with black bars.

Mocha, a seaport, and once the capital of Yemen in Arabia, situated on the Red Sea, 130 miles WNW. of Aden. From early in the 16th century until the middle of the 17th Mocha was the port from which the coffee of Yemen was principally exported; hence called Mocha coffee. It is now a decayed place. Pop. 5000.

Mocha Stones are pieces of agate or of chalcedony, containing dendritic infiltrations, often assuming appearances very like finely ramified coniferous, &c. They were first brought to Europe from Mocha. Of the same nature with Mocha stones are Moss Agates.

MOCKING-BIRD, or MOCKING-THRUSH (Minus), a genus of birds of the family Turdidae, order Passeres, having a more elongated form than the true thrushes, a longer tail, shorter wings, and the upper mandible more curved at the tip. Twenty species are known, ranging from Canada to Patagonia, and from the West Indies to the Galapagos Islands. The best-known species, the mocking-bird of the United States (M. polyglottus), is about the size of the song-thrush; the upper parts of a dark brownish ash colour, the wings and tail nearly black, the under parts brownish white. The mocking-bird is common in almost all parts of America, from the south of New England to Brazil; north of the Delaware it is only a summer visitor, but in more southern regions it is found at all seasons. It is one of the most common birds of the West Indies, and its exquisite song fills the groves with melody by night, for which reason it is there very generally known as the nightingale. By day the mocking-bird is generally inactive, exceding all birds in its power of imitation, now taking up the song of one bird, and now of another, and often deceiving the most practised ear by its perfect performance. By night its song is for the most part natural. It does not confine itself, however, to natural strains; it seems to take equal pleasure in repeating the loudest cries of the feathered tribes, and in domestication readily adds to its accomplishments the imitation of almost any sound which it is accustomed to hear, passing from one to another with great rapidity, so as to
produce an incomparable medley. The mockingbird readily learns to whistle a tune, even of considerable length, but there is no well-authenticated instance of its imitating the human voice. The barking of a dog, the mewing of a cat, the crowing of a cock, the cackling of a hen, the creaking of a wheel, the treading of boots, all within the reach of its powers. During its performances it spreads its wings, expands its tail, and tosses itself about, as if full of enthusiasm and enjoyment. The mocking-bird is vocal at all seasons of the year. It enjoys almost everywhere the protection of man, and most despises the nest in a tree or on a bush close beside a house. The nest is rudely constructed of dried sticks, withered leaves and grasses, and lined internally with fibrous roots. The eggs are of a short ovoid form, and of a light-green colour spotted with amber. For the first brood from four to six are laid; for the second, four or five; and when there is a third brood, seldom more than three. The first brood is hatched about the middle of April. The male is extremely attentive to his mate, and manifests extraordinary courage in driving away enemies from the nest. Mocking-birds often assemble on some high oceans, or on birds of prey, far superior to them in size and strength, are compelled to retreat. Snakes are killed by reiterated blows on the head, and cats learn to consider the vicinity of a mocking-bird's nest unsa
The food of the mocking-bird consists chiefly of berries and insects. The mocking-bird is often seen reared by the hand if removed early from the nest, but it is said that it never attains in captivity the same wealth of song as in its free state. Another species of mocking-bird is found in the Rocky Mountains, and is the smallest in the genus and among the finest song-birds of the temperate parts of South America.

Mock Orange, a name applied in England to the Syringa (q.v.), and in the United States to the Prunus caroliniana, a small evergreen resembling the cherry-laure.

Mold, a name given to the ecclesiastical scales formulated by St. Ambrose and St. Gregory (see HARMONY, Plain-song). For Major and Minor Modes, see SCALE, DORIAN and LYDIAN, HARMONY.

Modelling. See CLAY, POTTERY, SCULPTURE.

Modena (anc. Mutina), capital of the former duchy of Modena, stands on a broad plain in Northern Italy, 23 miles by rail NW. of Bologna. Pop. (1881) 31,693; of commune (1893), 64,900. It had extensive ramparts, long since removed, and extensive promenades, and has fine streets, many of which aread both sides. The ancient Via Emilia divides it into the old and new city. The cathedral of St. Geminianus, a Romanesque building, was begun, at the instance of the famous Countess Matilda, in 1129, and has a fine facade; its campanile is one of the great towers of Italy. The ducale (now royal) palace, a picturesque structure of the 17th century, has an infinity of galleries, courts, and marble arches, and contains the Este library of 90,000 volumes and 3000 MSS., the Este archives, the collections of ancient and modern pictures, and a gallery of pictures, including works by Guido, the Carracci, Guercino, Correggio, and other great Italian masters. Modena possesses besides a university (1678), with 33 teachers and 287 students, an academy for arts and sciences, an observatory, a botanical garden, and military schools. The chief manufactured products are silk, leather, vinegar, and coal. There is a lively trade in agricultural products. Originally an Etruscan town, Modena was conquered successively by the Gauls, the Romans, and destroyed by Constantine the Great, the Goths, and the Longobards. Charlemagne made it the capital of a line of counts. The family of Este (q.v.) became its masters in 1288; and in 1432 the reigning marquis was created duke by the Emperor Frederick III. During the first half of the 19th century its dukes pursued a tyrannous reactive policy against liberalism, and were on more than one occasion expelled their dominions, finally and definitively in 1860. The duchy was then incorpo-rated in the kingdom of Italy, and afterwards divided into the provinces of Modena, Reggio, and Massa-Carrara. Area of province, 994 sq. m.; pop. (1881) 279,554; (1896) 290,446.

Modica, an inland town of Sicialy, 45 miles SW. of Syracuse, with trade in fruit, oil, wine, and grain. Pop. 35,500.

Modjeska. Helena, Polish actress, was born in Cracow, 12th October 1844, and began to act in a travelling company in 1861. Four years later she made a great name at Cracow, and from 1868 to 1876 was the first actress of Warsaw. Then she settled, with her second husband, near Los Angeles, California, and after an interval of three years, succeeding, she returned to the stage, and won a complete triumph as Adrienne Lecouvreur at San Francisco in 1877, although she acted in English, of which language she had known nothing seven months before. She was acknowledged one of the greatest of modern emotional actresses, achieving triumphs, both in the United States and in Great Britain, in Juliet, Rosalind, Beatrice, and in the Drame aux Camélias; but ere long she returned to farming and bee-keeping in California.

Modocs, an Indian tribe of Northern Californa, which in 1872, after firing on the United States forces, entrenched in the neighbouring lava-bed, and there defied themselves desperately till June 1873, killing or wounding 132 of the troops. Their chief, Captain Jack, and three others were hanged in October; about a hundred who had not followed him were permitted to remain in California, the rest (145) were transferred to Indian territory.

Modulation, in Music. When in the course of a melody the keynote is changed, and the original scale altered by the introduction of a new sharp or flat, such change is called modulation. Much of the pleasure of music is derived from a judicious use of modulation. The art of good modulation from one key to another consists in the proper choice of intermediate chords. Sudden transitions, without intermediate chords, should be employed but sparingly, and in peculiar circumstances.

Moe, Jörgen (1815-82). See ÅSTRÖMSEN.

Möen, a Danish island in the Baltic Sea, at the south-east end of Zealand. It is 20 miles in length, and has 13,000 inhabitants.

Méris, Lake, the ancient Greek name of a sheet of water in Egypt, now in the province of Fayûm (q.v.), about 60 miles SW. of Cairo; hence the expression in Roman poetry. 190 miles long, and is traversed by the Luapula (see CONGO). This lake was discovered by Livingstone in 1868. Its shores yield salt.

Mosin, an ancient Roman province, divided by the river Cibrus (Zbrizza) into two parts, the eastern corresponding to the present Bulgaria, and the western (Mos sia Superior) to Servia. Its original inhabitants were mostly of Thracian race. In 75 B.C. the Romans first came into
conflict with the Gaulish or Celtic invaders of the land, who had settled in Western Mesopotamia two hundred years previously; but they did not conquer Western or Lower Mesopotamia until 15 B.C. To protect these provinces from the Dacians and Sarmatians beyond the river, a wall was built and fortified posts erected along the Danube. The Emperor Valens permitted the Visigoths to settle in Mesopotamia in the 5th to the 7th century. Western Mesopotamia was colonised by the Slav races who still occupy it, and Eastern Mesopotamia by the Bulgarians.

Mesopotamia, the name given to the region (q.v.) who in the 3rd century and in the 5th settled in Lower Mesopotamia. It was for them that Ulfilas (q.v.) translated the Scriptures.

Moffat, a pleasant watering-place and hanger of barony (1635) in Upper Annandale, Dumfriesshire, 31 miles SSW. of Edinburgh by road, and 64 by a short branch (1883) of the Caledonian Railway. It lies 370 feet above sea-level, engirt by round grassy hills (the loftiest, Hartfell, 2651 feet), and in the midst of delightful scenery, chief features of which are 'dark Loch Skene,' the Great Main, and the Devil's Tail. Its mineral springs, the principal of which, like that of Harrogate, is saline and sulphurous, have been celebrated since 1653; and its visitors have included Home, Hume, Carlyle, 'Ossian Macpherson,' Boswell, Blair, Burns, and William Black. He arrived at Capetown in January 1817, and proceeded northwards beyond the boundaries of Cape Colony and began his labours (January 1818) in Great Namaland at the kraal of Afrikano, a chief who from being a terror to the neighbouring districts of the colony had embraced Christianity, and who showed a desire for its propagation. On December 27, 1819, Moffat married Mary Smith (1790-1870), daughter of his former employer at Dukinfield near Manchester, who proved a worthy helpmate. He made several journeys and laboured at various stations before he settled at Kuruman (1829-57) on the Rundu River. There he wrought a marvellous work in reforming the habits of the natives, and Kuruman became a centre of Christian light and civilisation. Wherever he went he preached the gospel, and guided the people in the arts of civilised life. He learned the Sotho language, and printed in it the New Testament (1840), the Old Testament (1857), and several religious works. Moffat spent about five years in England (1838-43), where he had an enthusiastic reception, and published his Labours and Scenes in South Africa (1842), which contained an account of his missionary tours and remarkable adventures. In 1843 Moffat returned to his labours reinforced by other missionaries, remaining till 1870, when he finally returned to England after forty-five years spent in Africa. In 1874 he was presented with £5000 in recognition of his services. He died on August 9, 1883. Moffat was one of the most ardent of the Zulu converts, and he died an advocate and a writer of the Zulu Bible.

Mofussil (from an Arabic word meaning 'separate'), a term commonly used by Anglo-Indians for the rural parishes, districts, or small administrative headquarters. Thus in Bengal the Mofussil means practically the whole province beyond the city of Calcutta.

Mogador, or Safi, a seaport 130 miles WSW. of the city of Morocco. Pop. about 19,000, of whom 8000 are Jews and 200 Europeans. It stands on a rocky promontory, close to a small harbor, between which forms the somewhat indifferent harbour. It is the best built and most modern town in the empire, having been laid out in 1760 by Cornut, a French engineer. On its landward side the place is surrounded by drifting sandhills, but the climate is salubrious, dry, and temperate. In the Kasbah or Castle, extended in 1655 by the 'New Kasbah,' live the governor and other Moorish officials, nearly all the Christians, the consular corps, and a number of protected Jews: here also are the government offices. The harbour is exclusively for the cities of Morocco and Demnat, but for the whole of the Sidi country. It exports almonds, olive-oil, wool, goat-skins, hair, gum-arabic, beans, lemons (citrons), &c. Commerce is mainly in the Jews' hands. The chief island, are woolens, cottons, glass, candles, tin and copper sheets, and hardware generally. Its manufactures are brass trays, daggers, furniture of arm wood, woolen cloth, &c. The total imports are on an average worth about £175,000, and the exports £175,000 per annum, of which fully three-fourths are sent from or taken to Great Britain. See Brown's edition of Pellow's Adventures (1890).

Mogilef, See Mohileff.

Mogun, a town and small port of Spain, on the Rio Tinto, near its mouth, and 8 miles E. of Huelva, with some trade. Pop. 8022.

Mogul, also spelt Mogulut and Moghut, is really but another form of Mogul. The term 'great Mogul' is the popular designation of the emperor of Delhi in India. The first Great Mogul was Baber (q.v.), a descendant of Timur the Tartar (q.v.), who founded the empire in 1526. The dynasty lost its power and territories to the English in 1765. The last emperor, having joined the rebels in 1857, died a prisoner in Ran-goon (1862). See Keene, Mogulut Empire (1866).

Mohacs, a market-town of Hungary, on the western arm of the Danube, 37 miles by rail ESE. of Funkirk. It is a station for steamers on the Danube, and the seat of considerable trade in wine, coal, timber, and agricultural produce. Pop. 14,403. Here, on 29th August 1526, Louis II. of Hungary, with 25,000 Hungarians, met the Sultan Soliman at the head of 200,000 Turks. The battle resulted in the disastrous defeat of the Hungarians, who lost their king, seven bishops, many nobles and dignitaries, and upwards of 22,000 men. In a second battle fought here on August 12, 1687, the Turks in their turn were defeated by an Austro-Hungarian army under Charles of Lorraine.

Mohair, the wool of the Angora Goat (q.v.). Few animals are so beautiful as the fine, soft, silky, long, and always pure white wool of this goat. See Wool.

Mohammed (Muhammad, and less correctly Mahomet ; Arab., ' Praiseful '), the founder of Islam. He was born about the year 570 A.D., at Mecca,
and was the son of Abbâlîlah, of the family of the Hashîm, and of Amina, of the family of Zahra, both of the powerful tribe of the Koreish, but of a side-branch only, and therefore of little or no influence. His father, a poor merchant, died either before or shortly after Mohammed's birth, whom his mother is then supposed to have handed over to a Bedouin woman, to be brought up in the heat of the sandy desert; but in consequence of the repeated fits of the child, which were ascribed to demons, the nurse sent him back in his third year. When six years old he lost his mother also. His grandfather, Abû Al-Muttaalih, adopted the boy; and when, two years later, he too died, Mohammed's uncle, Abu Talib, though poor himself, took him into his house, and remained his best friend and protector throughout his whole life. It seems that he at first gained a scanty livelihood by tending the flocks of the Meccans. In his twentieth-fifth year he entered the service of a rich widow, named Khadija, likewise descending from the Koreish, and accompanied her caravans—in an inferior capacity, perhaps as a camel-driver—thus visiting Syria. Up to that time his circumstances were very poor. Suddenly his fortune changed. The wealthy, but fifteen years older, and twice widowed, Abu Khadija accepted him. She bore him a son, Al-Kâsîm—whence Mohammed adopted the name Abu-Kâsîm—and four daughters: Zainâh, Rukaita, Umm Khulthum, and Fâtima; and afterwards a second son, whom he named Taîf, which was afterwards taken by him as a name among his tribe. Both his sons died early. Mohammed continued his merchant's trade at Mecca, but spent most of his time in solitary contemplations. Mohammed was of middle height, rather lean, but broad-shouldered, altogether of strong build, and possessed of extraordinary strength. His black hair flowed round his strongly developed head; his eyes, everhung with thick eyelashes, were large and coal-black; his nose, large and slightly bent, was well formed. A long beard added to the dignity of his appearance. A black mole between his eyebrows never ceased to be a mark of distinction among the faithful, 'the seal of prophecy.' In his walk he moved his whole body violently, 'as if descending a mountain.'

About the year 600 A.D. Christianity had penetrated into the heart of Arabia, through Syria on the one hand, and Abyssinia on the other. Christianity less played a prominent part in the peninsula, chiefly in its northern parts, which were dotted over with Jewish colonies, founded by emigrants after the destruction of Jerusalem; and round about Yathrib (Medina) remainants of the numerous ancient sects, dating from the first Christian centuries, such as Sabians and Mandaeans, heightened the religious ferment which, shortly before the time of Mohammed, had begun to move the minds of the thoughtful. At that time there arose several men in the Hedjaz who preached the fatality of the ancient pagan creed, with its star-worship, its pilgrimages and festive ceremonies, its temples and its fetiches. It had in reality long ceased to be a living faith; but the great mass of the people clung to it as to a sacred inheritance. This was the time of the so-called 'Jewish' prophet, Abraham—human responsibility, and judgment to come were the doctrines promulgated by these Hasîmis ('converts'), forerunners of Mohammed; and many, roused by their words, turned either to them or to the Christians. The priests of these missionary labourers were Medîna, Taîf, and Mecca; this last was then the centre of pilgrimage to most of the Arabian tribes, and there, from times immemorial, the Kâaba, Mount Arafa, the Valley of Minna, &c., were held sacred—the Koreish, Mohammed's tribe, having had the care of these sanctuaries ever since the 5th century. It was under these circumstances that Mohammed felt moved to teach a new faith, which should dispense with idolatry on the one hand, as with narrow Judaism and corrupt Christianity on the other. He was forty years of age when he received the first 'divine' communication in the solitude of the mountain Hira, near Mecca. Gabriel appeared to him, and Mohammed's mission began, that is to say, to preach the true religion. That he was no vulgar impostor is now generally recognised. What part his epistle, or rather hystera, had in his visions we are not able to determine. Certain it is—that, after long and painful solitary broodings, something at times moved him with such fearful rapturous vehemence that, during his revelations, he is said to have roared like a camel, and to have streamed with perspiration; his eyes turned red, and the foam stood on his lips. The voices he heard were sometimes those of a bell, sometimes of a man, sometimes they caiss in his dreams, or they were laid in his heart. Waraka, one of his wife's relatives, who had embraced Judaism, spoke to him of the Jewish doctrine, and told him the story of the patriarchs and Israel, not so much according to the Bible as to the Midrash; and the gorgonous beauty of their legend he seems to have made as deep an impression on Mohammed's poetical mind as the doctrine of the unity of God and the morale of the Old Testament, together with its civil and religious laws.

Christianity and Judaism. All his knowledge of the New Testament was confined to a few apocryphal books, and with all his deep reverence for Jesus, whom he calls the greatest prophet next to himself, his notions of the Christian religion and its founder were excessively vague (see Korâ). His first revelation he communicated to no one, it would appear, except to Khadija, to his daughters, his stepson Ali, his favourite slave Zaid, and his friend the prudent and honest Abu Bekr. His other relatives rejected his teachings with scorn; some, sometimes they caiss in his dreams, or they were laid in his heart. Waraka, one of his wife's relatives, who had embraced Judaism, spoke to him of the Jewish doctrine, and told him the story of the patriarchs and Israel, not so much according to the Bible as to the Midrash; and the gorgonous beauty of their legend he seems to have made as deep an impression on Mohammed's poetical mind as the doctrine of the unity of God and the morale of the Old Testament, together with its civil and religious laws. which at first consisted merely of brief, rhymed sentences in the manner of the ancient Arabic soothsayers. The Meccans did not object to his doings; they considered him a common 'poet' or 'soothsayer,' who, moreover, was not in his right senses, or was simply a liar. Gradually, however, as the number of his converts increased, they began to take alarm, and to pay attention to his proceedings; and finally, fearing mostly for the sacredness of Mecca, which this new doctrine might abolish, they rose in fierce opposition against the new prophet and his adherents, who dared 'to call their ancient gods idols, and to put an enigma to the Korâeh. It was demanded that Abu Talib should silence or surrender his nephew. Abu Talib refused. Many of the converted slaves and freedmen had to undergo terrible punishments; and others suffered so much at the hands of their own relatives that they were fain to revoke their creed. A hundred believers, on the prophet's own advice, emigrated to Abyssinia. Mohammed himself, although protected by the strong arm of Abu Talib, was yet at that time so lo-spiritued and fearless that, before an assembly of the Koreish, he raised three of the idols of the temple of the moon and marked them —a dictum, however, which he next day revoked as an inspiration of Satan, thereby increasing the hatred of his adversaries. All the Hashimy family were now excommunicated, and all except Abu Lahab retired to Abu Talib's ravine in the mountains east of Mecca. After two years they were restored when on the brink of starvation.

A great grief befell Mohammed at this time—his faithful wife Khadijâ died, and, shortly afterwards, his uncle Abu Talib; and, to add to his misery, the vicissitudes of his career had reduced him by this time to poverty and want. To provide for his family, he went to Taif, where he flourished; and among his friends was a certain 'Abd Allah, his 'aamir, who was one of the most zealous of his converts. He was soon driven from Taif and emigrated to Medina. There he flourished, and, after a time, was called to Medina to judge the disputes between the parties there. He was thereupon appointed by the leaders of the city as the chief judge, chief of the police, and the highest court of justice, and was considered one of the most powerful men in the city. He was known as the Mâlik, or 'teacher,' and was the greatest of the jurists of the time. He was also known as the 'Abd Allah of the Mâlik, or 'teacher,' and was the greatest of the jurists of the time. He was also known as the 'Abd Allah of the Mâlik, or 'teacher,' and was the greatest of the jurists of the time. He was also known as the 'Abd Allah of the Mâlik, or 'teacher,' and was the greatest of the jurists of the time. He was also known as the 'Abd Allah of the Mâlik, or 'teacher,' and was the greatest of the jurists of the time. He was also known as the 'Abd Allah of the Mâlik, or 'teacher,' and was the greatest of the jurists of the time. He was also known as the 'Abd Allah of the Mâlik, or 'teacher,
the messenger of God or at least as the Prince of Arabia, and the year 8 of the Hegira was therefore called the year of the Deposition. On Mount Arafat fixed for all time the ceremonies of the pilgrimage (Hajj); and he again solemnly exhorted his believers to righteousness and piety, and chiefly recommended them to protect the weak, the poor, and the women, and to abstain from usury.

Returned from Mecca, he occupied himself again with the carrying out of his expedition against Syria, a necessary aid to religion and patriotism in keeping his people together, but fell dangerously ill very soon after his return. One night, suffering from an attack of fever he went to the cemetery of Medina and prayed and wept upon the tombs, praising the dead, and wishing that he himself might soon be delivered from the storms of this world. When day dawned, he arose at last, too weak further to visit his wife, he chose the house of Ayeshah, situated near the mosque, as his abode during his sickness. He continued to take part in the public prayers as long as he could, until at last, feeling that his hour had come, he once more gave his last charge to his followers, to Bekr and Omsna the son of Zaid as the generals whom he had chosen for the army. He then asked whether he had wronged any one, and read passages from the Koran preparing the minds of his hearers for his death and exhorting them to peace among themselves. He inscribed the principles for writing materials, probably in order to fix his successor as chief of the faithful; but Omar, the most influential of his followers and friends, fearing he might douse Ali while he himself inclined to Abu Bekr, would not allow him to be furnished with them. In his last wanderings he spoke only of angels and heaven. He died in the lap of Ayeshah about noon of Monday the 12th (11th) of the third month in the year 11 of the Hegira (8th June 632). His death caused an immense excitement, and disturbed not only the faithful. Omar, who himself would not confess, was very inclined, to persuade the people that he was still alive. But Abu Bekr said to the assembled multitude: 'Whoever among you has served Mohammed let him know that Mohammed is dead; but he who has served the God of Mohammed let him continue in His service, for He is still alive and never dies.' While his corpse was yet unburied the quarrels about his successor, whom he had not definitely been able to appoint, commenced; but finally Abu Bekr received the homage of the principal Moslems at Medina. Mohammed was then buried in the night between the 9th and 10th of June, after long discussions, in the house of Ayeshah, where he had died, and which afterwards became part of the adjoining mosque.

A man of Mohammed's extraordinary powers and gifts is not to be judged by a modern commonplace standard; the manners and morals of his own time and country must also be taken into consideration. He was at times deceitful, cunning, revengeful, cowardly, addicted to sensuality, and given to murder; yet not only his public station as prophet, preacher, and prince, but also his private character, his amiability, his faithfulness towards friends, his tenderness towards his family, and the frequent readiness to forgive an enemy must be taken into consideration, besides the extreme simplicity of his domestic life; he lived when already in full power in a miserable hut, mended his own clothes, and freed all his slaves. And, to do him full justice, his melancholy temperament, his nervousness, which often bordered on frenzy, and brought him to the brink of suicide, and his poetic temperament must not be forgotten. Altogether his mind contained the strangest mixture of right and wrong, of truth and error. Although his self-estimate of the Hegira (622) among the prophets, and the pilgrimage, he yet believed in jinns, omens, charms, and dreams— an additional reason against the now generally abandoned notion that he was a vulgar designer, who by no means deceived himself about those revelations he pretended to have received. And though the religion of Islam may rightly or wrongly be considered the bane of eastern states and nations in our day, it should be remembered that it is not necessarily Islam that has caused the corruption, as indeed its ethics are for the most part of a high order; and in the second place, that Mohammed was not to be made responsible for all the errors of his successors. Take him all in all, the history of humanity has seen few more earnest, noble, and sincere 'prophets,' men irresistibly impelled by an inner power to admonish and to teach, and to utter anes and sublime truths the full purport of which is often unapprehended by those to whom they are addressed.

See the Lives in German by Will (1843), Spenger (1881-65), Noldeke (1863), Krell (vol. i. 1884); in French by Delaporte (1874); and Sir W. Muir, Life of Mahomet (4 vols. 1854-61; new ed. 1877), and Mohommed and Islam (1887); also a number of writings by Ameer, G.<kI>ekI, G.I.E, The Life and Teachings of Mohammed (1890).

MOHAMMEDANISM, the religion founded by Mohammed, or, according to him, the only orthodox creed existing from the beginning of the world, and preached by all the prophets ever since Adam. It is also called the religion of Islam, or of the Arabs, for it was founded on the mission to the will and precepts of God. In its exclusively dogmatical or theoretical part it is Ina, 'Faith,' in its practical, Din, 'Religion.' The fundamental principles of the former are contained in the two articles of belief: 'There is no God but God; and Mohammed is God's Apostle. The Mohammedan doctrine of God's nature and attributes coincides with the Christian, in so far as He is by both declared to be the Creator of all things in heaven and earth, who rules and preserves all things, without beginning, omnipotent, omniscient, omnipresent, almighty, and eternal. But, according to the Mohammedan belief, He has no offspring: 'He begetteth not, nor is He begotten.' Nor is Jesus called anything but a prophet and apostle, although His birth is said to have been due to a miraculous divine operation; and as the Koran superseded the Gospel, so Mohammed superseded Christ. The eunuch is said to have been carried out upon another person, Christ having been taken up unto God before the decree was put into execution. Christ will come again upon the earth to establish everywhere the Moslem religion, and to be a sign of the coming of the day of judgment. Next to the belief in God, that in angels forms a prominent dogma. Created of fire, and endowed with a kind of incorporeal body, of no sex, they stand between God and man, adoring or visiting upon God, or interceding for and guarding man. The four chief angels are Gabriel, the Holy Spirit,' or 'Angel of Revelations;' Michael, the special protector and guardian of the Jews; Raphael (Azrâîl, Azrâil), the 'Angel of Death;' and Uriel (Izrail), whose office it will be to sound the trumpet at the Resurrection. Islam borrowed its ideas of the unseen world from the Persians or from the Jews, who had borrowed them from the Persians (see ANGEL). To each human being are appointed two guardian angels. Besides angels, there are good and evil genii, the chief of the latter, who are
generally called Hafiz, being Ibils ('Despairs'), once called Azazl, who, refusing to pay homage to Adam, was rejected by God. These jinn are of a female sex, and are divided into two genera—half-saints and half-sinners. They are, in almost every respect, like the Šehīm in the Talmud and Midrash. A further belief is in certain God-given Scriptures, revealed successively to the different prophets. Four only of the original one hundred and four sacred books the Persians acknowledge, the Mohammedans—said to have survived—the three former, however, in a mutilated and falsified condition. The number of prophets, sent at various times, is stated variously at between two and three hundred thousand, among whom 315 were apostles, and six were specially commissioned to proclaim new laws and dispensations, which abrogated the preceding ones. These were Adam, Noah, Abraham, Moses, Jesus, and Mohammed—the last the greatest of them all, and the founder of the final dispensation.

The belief in the resurrection and the final judgment is the next article of faith. The dead will be received in their graves by an angel announcing the coming of the two examiners, Munkir and Nakir, who put questions to the corpse respecting his belief in God and Mohammed, and who, in accordance with the answers, will have to comfort him. Concerning the condition of the soul between death and the resurrection Islam has no authoritative teaching. The soul is supposed, according to its rank, either to enter immediately into paradise (as do the prophets), or to partake, in the shape of a green bird, of the delights of the abode of bliss (as the martyrs); while, in the case of common believers, it stays near the grave, or is with Adam in the lowest heaven, or remains either in the well of Zem-Zem or in the trumpet of the resurrection. The souls of the infidels dwell in a certain hell, called Jannat. Hades or, after it first offered to heaven, then offered to earth, and rejected by both, are subject to unspokenable torments until the day of resurrection. Concerning the latter, great discrepancy reigns among the Mohammedan theologians. Mohammed himself seems to have held that both soul and body will be raised; and the 'bone Luz' of the Jewish Haggarah was by him transformed into the bone Al Ajib ('the rump-bone'), which will remain uncorrupted till the last day, and from which the whole body will spring anew, after a forty days' rain. Among the scholastics, a number of various schools are known—all nearly taken from the legendary part of the Talmud and Midrash—are the decay of faith among men, the advancing of the meanest persons to highest dignities, wars, seditions, and tumults, and consequent dire distress. The sun will rise in the west, the Beast will appear, Constantinople will be taken by the descendants of Isaac, the Mahdī (q.v.) will come, the Dejījāl or arch-impostor also will come and be killed by Jesus at Lad. There will further take place a war with the Jews, the coming of Gog and Magog (Yāyah and Mājūy), a star in the southern heaven, which, returning to idolatry, the Kābā will be destroyed by the Ethiopians, beasts and inanimate things will speak, and finally, a wind will sweep away the souls of those who have faith. The time of the resurrection Mohammed himself could not learn from Gabriel: it is not evident that any will announce it: that of constellation, of such terrible powers that mothers shall neglect the babies on their breasts, and that heaven and earth will melt: that of examination, which will annihilate all the natural and belief in paradise and hell, and their inhabitants; and forty years later, at the general resurrection, when all men, Mohammed first, shall have their souls breathed into their restored bodies, and will sleep in their sepulchres until the final doom has been passed upon them. The day of judgment, lasting from one to fifty thousand years, will call up angels, genii, men, and animals. The trial in the fire; the river of fire; the bridge over fire; the bridge over fire jinn; and the bridge over fire hell, and the wicked will pass to the left into hell; both, however, have first to go over the bridge Al Sirāt, laid over the midst of hell, and finer than a hair, and sharper than the edge of a sword, and beset with thorns on either side. The eighteenth and last dispensation of paradise, in one and swiftness, but the wicked will fall down headlong to hell below.

Hell is divided into seven stories or apartments, respectively assigned to Mohammedans, Jews, Christians, Sabians, Magians, idolators, and, lowest of all, the hypocrites, who, outwardly professing a religion, in reality had none. The degrees of pain, chiefly consisting in intense heat and cold, vary; but Mohammedans and all who professed the unity of God will finally be released, while unbelievers and idolators will be condemned to eternal punishment. Paradise is divided from hell by a partition (Arāf), in which a certain number of half-saints will find place. The blessed, destined for the abodes of eternal delight (Jamāt Adīn; Heb. Gden Eden), will first drink of the Pond of Life, and then the Precipice, which is supplied from the rivers of paradise, whiter than milk, and more delicious than musk. Arrived at one of the eight gates, they will be met by beautiful youths and angels; and their degree of righteousness (prophets, religious teachers, martyrs, believers) will procure for them the corresponding degree of happiness. Yet, according to the Mohammedan doctrine, it is not a person's good works or merits that gain his admittance, but solely God's mercy. The poor will enter paradise five hundred years before the rich. The majority of the inhabitants of hell are Mohammedans, and the only real misfortunes which await the pious (and of which there are about a hundred degrees), are a wild conglomeration of Jewish, Christian, Magian, and other fancies on the subject, to which the Prophet's own exceedingly sensual imagination has added largely. Feasting in the most gorgeous and delicious variety, the most costly and brilliant garments, odours and music of the most ravishing nature, and above all, the enjoyment of the Hür Al Oyun, the black-eyed daughters of paradise, created of pure musk, and free from all the bodily weaknesses of the female sex. Among the inhabitants of paradise, who will always remain in the full vigour of their youth and manhood. For those deserving a higher degree of recompense rewards will be prepared of a purely spiritual kind—but the 'bouncing of God's face' by night and by day. A separate abode of happiness will also be reserved for women. The last of the precepts of pure faith taught by Mohammedanism is the full and unconditional submission to God's decree (Islam), and the predestination of good and evil. Not only a man's fortunes, but his deeds, and consequently his future arefoods, are irrevocably, and thus unavoidably, pre-ordained (Fat'eh, kismeh): a doctrine which is not, however, taken literally by all Moslems, but which has no doubt contributed largely to the success of Islam by inspiring its champions with the greatest content for the present and the desire for the future. The Din, or practical part of Islam, which contains the ritual and moral laws, inculcates as the chief duties the following four: prayer, almsgiving, fasting, and pilgrimage.

Prayer, 'the key of paradise,' comprises also certain religious ceremonies, as the most necessary preparations. They are of two kinds: the Ghacl, or total immersion of the body, required as a religious ceremony on some special occasions; and
the \textit{Wud\text{\textbar}d}, a partial ablation, to be performed immediately before the prayer. This is of primary importance, and consists of the washing of hands, face, ears, and feet up to the ankles—a proceeding generally accompanied at each stage by correspond- ing pious sentences, and concluded by the recital of the 97th chapter of the Koran. If water be beyond reach, dry dust or sand may supply its place. The practice of religion being founded on CHAPTER on the Koran, the prayer (Salat) is essentially correct, as the believer prays must be as clean as possible, and the use of a special prayer-curtain is therefore recommended. Every Mohammedan is obliged to pray five times in the space of every twenty-four hours. The prayer (Salat) itself consists partly of extracts from the Koran (Pard), partly of pieces ordained by the Prophet without allegation of a divine order (Sunnah). The first time of prayer commences about sunset; the second at nightfall; the third at daybreak; the fourth about noon; the fifth in the afternoon. The believers are not to commence their prayers exactly at sunrise, or noon, or sunset lest they might be confounded with the infidel Sun- worshippers. These several times of prayer are announded by the Muezzins (g.v.) from the minarets of the mosques. Their chant, sung to a very simple but solemn melody, sounds harmoniously and somor- conally through the length of day and night, and roil of the city, but its impressiveness is most strikingly poetical in the stillness of night. The day-call (the Adán) consists chiefly of the confession of faith (‘God is most great, ’ Mohammed is God’s prophet.’ Come to prayer”) repeated several times; the night-calls (Ula, the first; Ebed, the second), destined for persons who desire to perform supererogatory acts of devotion, are much longer. The believer often changes his posture during his prayers; and often stands in place, or on his knees, and makes prostrations, &c., is called a Rêka. It is also necessary that the face of the worshipper should be turned towards the Kibliah, in the direction of Meccas, the exterior wall of the mosque marking that direction being distinguished by a niche (the Mihrâb). All such ablutions and pompous apparel is laid aside before the believer approaches the sacred place; and the extreme solemnity and de- corum, the humility, the devotion which pervades it have been unanimously held up as an example to the world, and are not supposed to be open to the men, although not strictly forbidden to enter the mosque, yet are practically not allowed to pray there, lest their presence might be hurtful to true devotion. Besides these prayers, there are others ordained for special occasions, as on a pilgrimage, before a battle, at funerals, during an eclipse, &c. Moslems pray to God only, but implore the inter- cession of Mohammed, saints, and angels (see MOSQUE). Mohammedanism has no clergy in our sense of the word, the civil and religious law being bound up in one (see MOBIL, MUFTI). Moslems are not standardly of giving alms. These are twofold—legal and voluntary, but the former, once collected by the sovereign, and applied to pious uses, has now been practically abrogated. The latter is, according to the law, to be given once every year, of cattle, money, corn, fruit, and water, at the discretion of the giver, two and a half up to twenty per cent. Besides these, it is usual to bestow a measure of pro- visions upon the poor at the end of the sacred month of llama. The duties of fasting follows (see FAST). During the whole month of Ramadan the Moslem is com- manded to refrain from eating, drinking, smoking, smelling perfumes, bathing, and every unnecessary indulgence in worldly pleasure, from daybreak until sunset. From that period till the morning he is allowed to eat, drink, and enjoy himself. The Arabian year consisting of twelve lunar months, it often happens that the Ramadan falls in mid- summer, when the fasting, more especially the abstaining from drinking, is excessively mortify- ing. None are exempt from this duty save the sick, travellers, and soldiers in time of war; but they are bound to fast an equal number of days during some other months. Nurses and pregnant women are also exempt. It is Moslem's special and express desire that no one should fast who is not quite equal to it, lest he might injure his health and disqualify himself for neces- sary labor. Of the other commendable fast-days the Ashura, on the 10th of Moharram, deserves special mention. There are very few Moslems who do not keep the Ramadan, even if they neglect their other religious duties; at all events, they all pretend to keep it most strictly, fasting being consid- ered ‘one-fourth part of the faith,’ nay, ‘the gate of religion.’—For the fourth paramount duty of the Mohammedan, the pilgrimage to Mecca, see MECCA.

With the ‘positive’ ordinances of Islam may also be reckoned the minor and greater festivals. The first (Al-Fitr, or ‘breaking the fast’), following immediately upon the Ramadan, begins on the first day of the Greal Hijjeh, and is called the ‘Id El-Fitr. The second (Eed Al-Korban, or ‘sacrifice’) begins on the 10th of Dinn'l Hijjeh, when the pilgrims perform their sacrifice, and lasts three or four days. The weekly day of rest is the Friday, because, from the time it was first ordained, the people used to hold public assemblies for civil as well as religious purposes on that day. When the special Friday service with its Chatheb or Hamil is over, the people are allowed to return to their worldly affairs, if they cannot afford to give themselves up entirely to the pleasure or devotion for the rest of the sacred period. The ancient rite of circumcision is used in Moham- medanism as the badge of the faith. It is commonly performed between the sixth and eighth year. Of the fundamental prohibitory laws of the Koran, one forbids the drinking of wine, which includes all strong and inciting liquors, as giving rise to ‘more evil than good;’ and although of late, chiefly through European influence, very many Moslems have lost their religious scruples on this point, and forbidden and intemperance is seen in spirits, yet the great bulk of the faithful refrains even to make use of the proceeds of the sale of wine or grapes. Some over-serprous believers even include opium, coffee, and tobacco in the pro- hibition; but general practice has decided differ- ently. The prohibitory laws respecting food re- semble closely those of Judaism; blood, the flesh of swine, animals that have died from disease or age, or on which the name of some idol has been invoked, or that have been sacrificed to an idol, or have been strangled, or killed by a blow, a fall, or a sharp stroke, are all strictly forbidden. ‘Pure’ animals must be slaughtered according to certain fixed rules, and the name of God is to be invoked before the operation, with- out, however, the usual addition of the benevolent epithets. Fish, birds, and game are mostly allowed for food.

All games subject to chance, such as dice, cards, tables, bets, are considered so wicked that a gambler's testimony is invalid in a court of law. Chess and other games depending on skill, pro- vided that they do not interfere with the regular performance of religious duties, and that they are played without any stakes whatsoever, are allowed by the majority of Moslem theologians. Usury is strictly prohibited. Taking interest upon any loan, however large or small, or profiting in trade
The civil and criminal laws of Mohammedanism, founded both on the Koran and on the Traditions (Sunnas), are in some instances, where the letter of the written or oral precepts allows of various explanations, or where the case in question is not foreseen, interpreted according to the opinion of the four great masters of Islam—Abu Hanifa, Malek Ibn Ans, Shafei, Ibn Hanbal—within the pale of the Koran. The latter are not always in agreement, and, however, upon which all Mohammedans agree are the following. Polygamy is allowed. 'Take in marriage of the women who please you, two, three, or four; but if ye fear that ye cannot act equitably, one, or those whom your right hands have acquired by buying or sell.' The husband may bequeath, and his descendants are the first heirs; next come the claims of wives, parents, brothers, sisters, in their order. Where there is no legal heir the property falls to the crown. The law is very severe towards the debtor, the Koran recommending the creditor to remit a debt 'as alms.' Insolvency and inability to work for the discharge of the claim solve all further obligations. The most conscientious performances of all private contracts, however, is constantly recommended in the Koran.

Murder is punishable either with death or by the payment of a fine to the family of the deceased, according to their own pleasure. There must, however, be palliating circumstances in the latter case. Unintentional homicide is expiable by freeing a believer from slavery, and paying to the family a certain sum, or the debt of part of the deceased. He who has not the means of freeing a believer is to fast for two months, by way of penance. According to the strict letter of the law, a man is not liable to capital punishment for killing his own child or an infidel; but, practically, two different categories of offences, and the Mohammedan governments in our day: murder is punished with death, and no fine frees the culprit.

The Mosaic law of retaliation, in case of intentional wounds and mutilation, holds good also for Islam; that is (not, as has ignorantly been supposed, that the corresponding limb of the offender is to be cut off), a certain proportionate fine in money is to be paid to the injured. The payment for any of the single limbs of the human body, such as the nose, is the full price, the same as for a homicide; for a limb which is found twice, like land or foot, half; for a finger or toe, the tenth part. Women and slaves have smaller claims. Injuries of a dangerous or otherwise grievous nature pay the full price; those of an inferior kind bring the perpetrator within reach of the lash or cudgel.

The Koran determines theft to be punished by cutting off the chief offending limb, the right hand; the second theft is punishable by the loss of the left foot; the third, of the left hand; the fourth, of the right foot; but the ordinary punishments of imprisonment, hard labour, and the bastinado have been retained. For stealing, if the property stolen were of easy access to the thief, nor if it consisted of food, since he may have taken this to satisfy the craving of his hunger.

Unchastity on the part of a woman was, in the commencement of Islam, punished by imprisonment for life, for which afterwards, however, stoning was substituted in the case of a married woman, and a hundred stripes and a year's exile in the case of an unmarried free woman; a slave to undergo only half of that punishment. Fornication in every case is, by the Koran, to be visited with a hundred stripes.

Infidelity, or apostasy from Islam, is a crime to be visited by the death of the offender, if he has been warned thrice without repenting. Equally severe, and not to be averted by repentance or because the individual who commits the sin is not a Mohammedan, is the punishment for blasphemy—against God, Mohammed, Christ, Moses, or any other prophet.

A further injunction of the Koran, for the carrying out of which the time has well-nigh gone by, is that of making war against the Infidels. He who is in a condition that the war is just, and the propagation of Islam is reckoned a matter; while a deserter from the holy war is held up as an
MOHAMMEDANISM

MOHAWKS

object of execration, and has forfeited his life in this world as well as in the world to come. At first all the enemies taken in battle were ruthlessly slain. Later, however, it became the law to give the people of a different faith against whom war was declared the choice of three things: either to embrace Islam, or to be killed outright, or to pay a fine, and afterwards live at peace. From their very first days, the Mohawks knew that once, free in their persons and fortunes, and entitled to all the privileges of Moslems; or to submit to pay tribute—in which case they were allowed to continue in their religion, if it did not imply gross idolatry or otherwise offend against the laws of Islam. To decide the matter lies with fortune of war—in which case the captive women and children were made slaves, and the men either slain, unless they became converts at the last moment, or were otherwise disposed of by the prince. The fifth part of the spoil belongs 'to God,' that is, the Sanctuary, to the apostle and his kindred, to the orphans, the poor, and the traveller.

In cases for which subsequent ages found no written rules laid down by the Prophet, traditional or judicial decisions, as the Koran intimated, the precedents of the califs were binding. Hence contradictions in theory and practice have crept in, according to the different traditions and decisions of the linams or expounders of the law, besides the various interpretations put upon the book itself. Most of the discussions of the Mohammedans are about the secular tribunal. The secular tribunals, therefore, not unfrequently differ in their decisions from the judicial tribunals; and the distinction between the written civil Law of the ecclesiastical courts and the common Law, aided by the executive power, is, fortunately for the cause of civilisation, getting clearer and clearer every day.

That part of Islam which has undergone least change in the course of time, and which most distinctly reveals the mind of its author, is also its most complete and its most admirable part—we mean the ethics of the Koran. They are not found, any more than the other laws, brought together in one, or two, or three Surahs, but 'like golden threads' they are woven into the huge fabric of the religious constitution of Mohammed. Injustice, falsehood, strife, revenge, mockery, avarice, prodigality, debauchery, mis-trust, and suspicion are inveighed against as ungodly and wicked; while benevolence, liberality, modesty, forbearance, patience and endurance, frugality, sincerity, straightforwardness, decency, love of peace and truth, and, above all, trust in God and submission to His will are considered as the pillars of true piety, and the principal signs of a true believer. Nor must we omit to point out expressly that Mohammed never laid down that doctrine of absolute predestination which destroys all human will and freedom, because the individual's deeds cannot alter one iota in his destiny either in this world or in the next. So far from it, foolishness is distinctly prohibited in the Koran (ii. 196). Caution is recommended. And a glance at the whole system of faith, which is built on hope and fear, rewards and punishments, paradise and hell, destined to be man's portion according to his acts in this life, as well as the incessant exhortations to virtue and denunciations of vice, are sufficient to prove that the extreme doctrine of predestination, in its purest form, is rejected by Islam. But submission to the Lord's will, hope during misfortune, modesty in prosperity, and entire confidence in the Divine plans are supported by the argument that everything is in the hands of the Highest Being, and that there is no appeal against His absolute decrees.

That the worst side of Mohammed's character, the often wanton cruelty with which he pursued the propagation of his faith, should by his successors have been taken as a thing to be imitated is not wonderful if we consider how brilliant the results of the policy of the bloody sword had proved. The progress of the Moslem arms is described in the article CALIF. Eighty years after Mohammed's death his great rival, the Byzantine Emperor Michael II., was driven from a butcher's shop in Constantinople (1453), and the war-cry, 'La ilaha ill Allah!' resounded before the gates of Vienna (1529). From that time, however, the splendour and the power of Mohammedanism began to wane. Two hundred millions, or 14 per cent, of the human race, profess Islam. Two-thirds of these are found from Turkey to farthest Malaysia, the rest in Africa. There are upwards of 45 millions of Moslems in British India alone. Among the African races Mohammedanism has lately made great progress. Yet since the days of the Prophet, the Moslem nations have lost that promptitude and elasticity which promises great things. Its future fate will depend chiefly on the progress of European conquest in the East, and the amount of Western civilisation which it will, for good or evil, import thither.

The principal passages of Mohammedanism, its sobriety, its pure theism, its simple and intelligible creed, are heavily counterbalanced by its slavery, its degradation of woman, its stereotyping of laws and science, and its belief in the past rather than in the future. Yet over a great part of the world Mohammedanism is what the Prophet desired every prophet before him to have been, a pioneer of better things.

Besides the Koran, the Sunna, and the native (Arabic, Persian, Turkish, &c) writers on the foregoing subject, we mention as further references the works of the European scholars D'Herbelot, Sale, De Sacy, Hammer-Purgstall, Barekhardt, Spranger, Burton, Muir, Garein de Tassy, Lane, Weil, Geiger, Nüideke, Kremer. See also the articles on ARABIA, CALIF, CRUSADES, DEMONIOLOGY, KORAN, MECCA, SHIITES, SUNDNITE, TURKEY, VALEABAS.

**Mohammed.** The name of four sultans of Turkey, of whom the most noted is **MOHAMMED II.**, the conqueror of Constantinople; born 1430, succeeded 1451, died 1481. See TURKEY.

**Mohammedah (Mohammed),** a town of Khuzistan, Persia, near the Turkish frontier. It stands on the lower Karun, where the latter connects by the Halfar Canal with the Shat-el-Arab. It has about 5000 inhabitants, and has become of commercial importance since the opening of the navigation of the Karun (q.v.).

**Moharram, or Muharrem,** the first month of the Mohammedan year, kept by the Shiite Mohammedans as a month of fasting, an mourning in commemoration of the sufferings of Hassan and Hussein (Hasan and Hosain), nephews of the Prophet. A celebrated passion-play (Eng. version by Sir Lewis Pelly in 1879) is performed during this month in honour of the two saints at several towns in Persia and India.

**Mohave Desert,** a basin, with little water or vegetation, chiefly in the SE. of California, and extending into Arizona. The Mohave River rises in the San Bernardino range, and finally disappears in the Mohave Sink.

**Mohawks.** The Mohock or Mohawk Club, mentioned in the Spectator by Steele (No. 324) and Birch (No. 346). It existed also a Mohawk Club existing in London in 1711-12. 'The avowed design of their institution was mischief,' Gay mentions, in Trivia, that the Mohawks rolled
women in hogheads down Snowhill, and Swift told Stella of a report that eighty of them had become thieves into prison; while Lady Wentworth, writing to her son Lord Stratford, says, 'I am very much frightened with the fyer, but much more with a gang of devils that call themselves Mohocks.' A royal proclamation was issued against them, March 18, 1712.

Mohawks. See Iroquois.

Mohicans, or Mohicans, a warlike sub-tribe of Delaware, who in the 17th century settled in Connecticut, and afterwards helped the English against the French, and the colonists against the English. Of the few survivors, some remain at Norwich, and the rest are in Kansas and at Green Bay, Wisconsin. Their name has become widely known through Cooper's novel, The Last of the Mohicans.

Mohileff, or Mogileff, the capital of a government in European Russia, is situated on the right bank of the Donjper, 95 miles SW. of Smolensk. It is the seat of a Greek and a Roman Catholic archbishop, their respective cathedrals dating from 1250 and 1292. It was an old colony, and a town house built in 1679. Tanning is the principal industry. There is an active trade in cereals, leather, brandy, salt, sugar, fish, timber, &c. Pop. 45,311, fully two-thirds being Jews. The town was burned down by Peter the Great for strategic reasons in 1709. Here on 23d July, 1812 the French under Davout defeated the Russians under Bagration. —The government has an area of 18,551 sq. m. and a pop. (1891) of 1,417,169.

Mohileff, or Mogiloff, a town of Podolia, Russia, is situated on the left bank of the Donjester, 190 miles NW. of Odessa. Pop. 19,500.

Mohileff, or Molière, was born at Stuttgart, 25th October 1800, and educated for the Lutheran Church at Tilburg. But at an early age he was irresistibly attracted to oriental studies, and in 1823 he betook himself to the famous Silvestre de Sacy and Remusat at Paris. He was nominally professor at Tilburg from 1829 to 1833, but he lived all his life in Paris, becoming a member of the Institute in 1844, and professor of Persian at the Collège de France in 1847. He was long secretary to the Société Asiatique, and his admirably learned and luminous annual reports on the progress of oriental studies, were collected by Madame Mohil, under the title Vingtième Ann. d'Histoire des Études Orientales (2 vols. 1879-80). His great edition of the Shk Nâmâc was published in six folio volumes, from 1838 till 1868; a posthumous seventh volume, edited by Meynard, completed the gigantic undertaking in 1878 (Fr. trans., 7 vols., in same year). Mohil died 31 January 1876. He was a scholar of altogether unusual breadth of mind, and exercised a wide influence on his contemporaries, to which his charming and accomplished wife, née Mary Chark, contributed greatly. He was a member of one of the few centres at Paris of high thinking, refinement, and brilliant talk in the degradation of the Second Empire.

See Kathleen O'Meara's Madame Mohil; her Salon and Friends (1861); Mrs Simpson's Letters and Recollections of Molière (1857); and Max-Müller's Biographical Essays (1883).

Möller, Johann Adam, Roman Catholic theologian, was born at Igersheim, in Württemberg, May 6, 1706, and studied at the university of Tübingen, where, after being theological tutor, he was licensed so far as to proceed in 1730. His earliest publication was a treatise On the Unity of the Church (1825), which was followed, in 1827, by a historically-theological essay on Athanasius. But his reputation, both posthumous and among his own contemporaries, rests mainly on his well-known Syntaxis, a work on the doctrinal differences between Catholics and Protestants, as represented by their respective parliaments (1832). This remarkable book passed through five large editions in six years, was translated into all the leading languages of Europe, and drew forth numerous criticisms and rejoinders, the most considerable of which is that of Daur (q.v.), 1833. To this Moller has replied in 1855, and has since accepted a professorship in the new university of Munich. He died April 12, 1838. His miscellaneous works were collected and published posthumously (2 vols. 1839-40) by Dr Döllinger.

Moldart. See INVERNESS-SHIRE.

Moldore, a former gold coin of Portugal, worth 27s. sterling.

Moir, David Macbeth, a minor Scottish poet and humorist, was born at Musselburgh, January 5, 1798, and practised there as a physician till his death, July 6, 1851. He was much beloved by his friends for his amiability, and he earned a wide popularity, and made his pen-name of Delta (Δ) famous in Scotland at least by his verses contributed to Blackwood's Magazine. Of these a collection was made, and published in 1832. His most lasting merit is his genuinely humorous and still popular Autobiography of Mousie Wench (1828). Other books of less value were Outlines of the Ancient History of Medicine (1831) and Poetical Literature of the Past Half-century (1831).

Moira, Earl of. See Hastings (Marquis of).

Moire (from the French verb moirer, to water silk in a linear pattern, as distinguished from tubiser, to water or wave it in a small pattern), silks figured by the peculiar process called 'watering.' The silks for this purpose must be broad and of a good substantial make; thin and narrow silk will not do. They are wetted, and then folded with particular care, to ensure the threads of the fabric lying all in the same direction, and not crossing each other, except as in the usual way of the web and the warp. The folded pieces of silk are then submitted to an enormous pressure, generally in a hydraulic machine. By this process the air is expelled, and the moisture is translated from the moisture into curvilinear waves, which leave the permanent marking called watering. The finest kinds of watered silks are known as Moirés antiques.—The same process has been applied to woolen fabrics called Moreen, which is only an alteration of the word moire.

Moissac, a town in the French department of Tarn-et-Garonne, on the river Tarn, 111 miles SE. of Bordeaux. It has a very interesting church, built between 1100 and 1400. Pop. 5692.

Mokanxa, Hakim ben Atta, called Al-Mokanna, 'The Veiled,' was the founder of a sect in Khurasan, who first appeared in the 8th century, during the reign of Almālī, the third Imam of the Khassids. He commenced his career as a soldier. In a fight, an arrow pierced one of his eyes, and in order to hide this deformity he henceforth constantly wore a veil, a habit attributed by his followers to the necessity of shrouding from the eye of the beholder the slaughtering rage which issued from his divine countenance. Mokanna set himself up as an incarnation of God. Among other miracles, he is said to have caused a moon or moons to issue from a deep well. Mokanna found many adherents, and his little band increased so fast that it overthrew several fortified places. But Almālī marched against him, and after a long siege took his stronghold of Kosh (750 A.D.), when, together with the remnant of his army, the veiled one took poison.
Mole, a seaport of Italy, on the Adriatic, 12 miles by rail S.E. of Bari. Pop. 12,070.

Mola di Gaeta. See Formia.

Molasses. See Sugar.

Mold, a town of Flintshire, on the Alyn, in a rich mineral district, 14 miles by rail W. by S. of Chester. Its fine 15th-century church, rich in stained glass, contains the grave of the painter Wilson. The former county prison, recently built at a cost of £23,000, was sold in 1880 for £3500 to expelletl French Jesuits, who renamed it St Germanus' House, in memory of the 'Alleluia Victory' hard by (see GERMANUS). With Flint, &c., Mold returns one member. Pop. (1851) 4582; (1891) 4457.

Moldau (Bohemian Vltava), the chief river of Bohemia, and an important tributary of the Elbe, rises in the Böhmerwald Mountains, on the southwest frontier, at an elevation of 3870 feet above sea-level, and flows south-east to Bohenfurt, where it bends northward, and pursues that direction to its confluence with the Elbe opposite Melnik, after a course of 278 miles. Its course to the point of confluence is longer than that of the Elbe, and the navigation of that river is greatly facilitated by the body of water which it contributes. It receives on the left the Wotawa and the Beroun, and on the right the Lutschitz and the Sazava. The chief towns on its banks are Budweis and Prague. It becomes navigable from Budweis.

Moldavia, formerly a principality, now forming the northern division of the kingdom of Romania (q.v.).

Mole (Talpa), a genus of quadrupeds of the order Insectivora and family Talpide. In structure and habits all the species, seven in number, essentially resemble the Common Mole (T. europaea). This animal is found in the southern and central parts of Europe, extending northwards as far as to the shores of the Baltic and throughout Denmark, also in central Asia as far as to the confines of China. In Britain it is very plentiful, but it is not found in Ireland, nor in the western islands of Scotland, except in Mull. It possesses a plump, nearly cylindrical body, covered with a velvet-like coat of short soft fur of a black or blackish-brown colour inserted perpendicularly to the skin, very short stout limbs with naked flesh-coloured feet, a short scaly tail furnished with long stiff hairs, and a pointed muzzle. The total length is about 6 inches, of which the tail measures about half an inch. It has no external ears, and its eyes are so minute as to be easily overlooked. By its bodily structure it is so eminently fitted for underground progressions that it might almost be said to swim through the soft earth. Its whole skull is like a wedge, and its nose is a lacer fastened to the sharp end of the wedge. The nostrils are elastic and flexible tubes of cartilage, strengthened by a little bone, and moved by special muscles. The fore-limb is enclosed in the skin of the body up to the wrist. The fore-feet are extremely broad and strong, the palm is turned outwards and backwards; the last phalanges are much longer than the others, are bifurcated, and have strong claws firmly attached to them. The wrist is composed of short and compact bones, and from its inner side there springs a long sickle-shaped bone which runs forward towards the first digit, strengthening the hand and increasing its breadth. The elbow process is long, thus giving greater leverage to the arm than usual. The bone of the upper arm is short, broad, flattened at both extremities, and contracted in the middle, and has upon it very prominent ridges for the attachment of the muscles moving the shoulder-joint. These ridges give it a most peculiar appearance, different from anything found among mammals. The shoulder-blade has the form of a long stout triangular rod. The breast-bone has its forepart (manubrium) longer than the body and keeled below and expanded. The collar-bone is short, almost conoid, and is placed at some considerable distance in front of the ribs, thus allowing the forelimb to be brought very close to the head in burrowing. The hind-limbs are more slender, and are used only for purposes of progression. The incisor teeth are small and sharp, the upper canine is long and possesses a double fang. There are three nearly equal conical premolars and a fourth much larger: the true molars are broad, with many sharp conical projections. The dentition is represented by the formula: 4 c. 1 p. 3 m. 3 = 44. The senses of hearing, taste, and smell are very strongly developed. The eye is extremely small, with a nearly globular lens and a minute optic nerve, and is at least sensitive to light. The mole is an exceedingly voracious animal; his appetite is of a sort of frenzy—a 'rage of hunger.' Vegetable substances form no part of his diet. Earthworms, the larvae of various insects, mice, small birds, lizards, frogs, even weaker individuals of his own species, all fall victims to his ravages. His practice is to throw himself, in a state of violent excitement as if maddened with rage, on his prey, and immediately, if it is a bird or a quadruped he has captured, to tear open its abdomen and satiate himself with blood. His favourite food is earthworms, and in quest of them, and guided chiefly by the sense of smell, he works his way underground, throwing up the earth in mole-hills; more rarely in fine summer nights he seeks for them on the surface of the ground, where he is himself in turn likely to be
picked up by some hungry owl. The mole's digestion is very rapid; after a feast he falls into a profound sleep, but from this he soon wakes prepared for another raid. If deprived of food for even a short time he perishes. His thirst, too, is very great, and where there is a colony of moles it is said that a run is always made towards the nearest ditch or pond, and also that where water cannot be conveniently reached deep perpendicular shafts are sunk into the ground, at the bottom of which water is always found.

The habitation of the mole is a very remarkable structure. Each mole has his own encampment, but sometimes two or three moles may be sufficiently sociable to share a common passage. It consists of a hillock of earth larger than an ordinary mole-hill, and containing two circular galleries, one above the other, with live connecting passages, and a central chamber which has access to the upper gallery by three passages; whilst about nine passages lead away from the lower gallery in different directions. The end of a passage entering a gallery on one side usually opens in the front of, or end of, a passage entering on the other. To afford all facility of escape in case of alarm, a passage leads at first downwards from the central chamber, and then upwards till it joins one of the high roads, kept open for access to the moles' hunting-grounds or for escape in time of danger. Moles pair early in spring. As the males exceed the females in number there is often a search for the females and a fierce struggle for possession of them. The shallow tracks running in all directions which are made by the mole when in search of a partner are called by French naturalists traces d'amour. The nest in which the female mole produces her young is not the encampment that has been described, but is a chamber lined with dried grass, leaves, and fine roots, formed generally under a mole-hill rather larger than usual at the point of meeting of two or three ordinary passages, at some distance from the fortress. Only a single litter is produced in the year, consisting of four or five young, rarely more. The attachment of the parent moles to their young and also to each other seems to be very strong.

Of all British mammals moles are the most constantly and determinedly persecuted. They are regarded by farmers and gardeners as a pest owing to the injury done to lawns and pastures by their burrows, and to young plants in their search for grubs; and mole-catching has long been practised in Britain as an extensive trade. Capture is effected by inserting traps of various kinds in the runs made by the moles, which catch them as they pass. It is a question, however, whether moles do not fully compensate for the injury they do by destroying many insects and other noxious animals. Another species of mole († T. canis) is found in the most southern parts of Europe, very similar to the common mole, but rather smaller, and having its eyes covered by a membrane which is pierced only by a minute hole, so that it justifies Aristotle's assertion that the mole is blind. Among the other Talpidae are the Cape Golden Mole (Chaetarchus capensis), which exhibits splendid metallic reflections, and is remarkable in not having the clavicle short and the manubrium of the sternum expanded and keeled, but in having the chest-wall hollowed out for the lodgment of the fore-limb; the Star-nosed Mole (Scopulus), a genus to which the most common American moles belong, so called from his peculiarity of being marked with an expanse of skin bearing large tactile hairs; and the Shrew mole (Condyura), also American, and found from Canada to Florida, having the end of the nose surrounded by about twenty fleshy radiating filaments, which are movable, and serve as organs of touch.

The name mole is abbreviated from the old English name Mouldtory or Mouldtory, still provincially used, which is derived from the Anglo-Saxon mail, 'mound,' and scroper, 'to throw up.' Cf. Ger. Maultory. For moles on the person, see NEVUS.

Molé, Matthieu Louis, Comte, a statesman, descendant of Matthieu Molé (1584–1656), the mediator between the king of France and the parliament of Paris during the troubles of the Fronde, and son of Edouard Molé, president of the parliament in 1788, was born at Paris, 24th January 1781. As soon as the storms of the Revolution were assuaged, Molé returned to France, and made his début in public life with Essai de Morale et de Politique, in which he vindicated the government of Napoleon on the ground of necessity. The emperor appointed him Master of Requests, and eventually raised him (1812) to the dignity of a count, and to a place in the cabinet. Louis XVIII. made him a peer in 1815, and in the same year he was appointed minister of Marine. After Louis-Philippe ascended the throne he became minister of Foreign Affairs, but at the end of a few months gave place to the Duc de Broglie. In 1836 he succeeded Thiers as prime-minister; his ministry was unpopular, and in 1839 he appealed to the electors, but unsuccessfully. Henceforward he took little part in political affairs, except that after the revolution of 1848 he exerted himself, though in vain, to restore and unite the party of order in the Assembly, to which he had been elected. He died at Châmpétreux, 23d November 1855.

Molec-ricket. See CRICKET.

Molecule. The smallest mass of any substance which can exist in the free state without modification, through subdivision, of its chemical constitution or of its physical properties. Molecules are held to be of definite size and mass; and any piece of apparently homogeneous matter is held to be made up of molecules or granules which conjointly make up the aggregate mass. That matter, apparently homogeneous, is really granular in this sense, appears firstly from the following physical considerations: (1) Compressibility and porosity show that matter does not fill space; (2) dispersion of light by the prism would be impossible if the glass were homogeneous; (3) chemical combination is attended with the absorption of heat in the summation of the chemical reaction; (4) soap-films require the agency to stretch them, and if they could be attenuated beyond a certain limit the energy applied in stretching them would be more than sufficient to volatilise them; (5) the kinetic theory of gases, when numerically worked out, shows the number of molecules in a given space to be limited (see MATTER). These considerations lead to the conclusion that it is impos-
sible to have a sheet of matter thinner than from \( \text{T}_1 \) to \( \text{T}_2 \) cm. to \( \text{T}_2 \) cm. thick; and that a figure of this order represents the diameter of the space occupied by one molecule of hydrogen. On the chemical point of view, the laws of definite proportion and of multiple proportion find their best explanation in the atomic theory; but the chemical atom, which is active, is not the same thing as the physical molecule, which is chemically somewhat inert; as we may see in the continual tendency of the mutual combination of oxygen and hydrogen when in the nascent state, or when exposed to high temperature, and their want of combination when simply mixed as free gases at ordinary temperatures.

The kinetic theory of gases—that gases consist of molecules in a continual condition of mutual collision and rebound—leads to the theorem (Avogadro's Law) that all gases contain within the same volume, under equal conditions of temperature and pressure, the same number of molecules; and if we assume each molecule to be made up of the masses of a group of chemical atoms sufficient to make up the smallest possible free mass of the chemical substance, then this law is in perfect accord with the observations of Dulong and Petit on the relative densities of the gases, which are equal to the atomic weights of the molecules, as derived from the known atomic weights or combining masses of the elements (see Chemistry).

For this reason it has been usual to ascertain the molecular weight of substances by observation of their content by volume, the molecular weight of hydrogen being reckoned as 2, or that of oxygen as 32. Thus, hydrochloric acid gas, which is 18.25 times as heavy as hydrogen gas, has a molecular weight 36.5, which is equal to the sum of the atomic weights of hydrogen (1), chlorine (35.5) and of hydrogen (= 1). Hydrogen itself has a molecular weight 2, not 2, because its molecule is held to be made up of two atoms, each of which has an atomic weight equal to unity; and so with other elementary gaseous or volatile substances. There are abnormalities, however; sulphur vapour has an extraordinary density as to show its molecule to consist, below a red heat, of six atoms, while at higher temperatures it consists of two; iodine vapour at lower temperatures has two, at higher one atom in the molecule; mercury, cadmium, zinc, potassium, and all other molecules consist of one of each; chlorine and bromine molecules partially break up into single atoms when heated. The molecules of liquids are probably compound; those of solids are almost certainly so, as allotroic modifications and variations in crystalline form show, though the vapours, produced from these various forms, if the solids be volatile, are identical. Other and more convenient means of measuring molecular weights have recently become known. These are—(1) a solid dissolved in a liquid lowers the vapour pressure (or 'vapour tension') of that liquid by an amount which bears to the original vapour pressure at the particular temperature of experiment the same ratio as the number of molecules of the dissolved substance does to the total number of molecules in the solution (Raoult); (2) the freezing point of a solution is lowered in a similar ratio (Raoult); (3) osmotic pressure (see Osmosis) is the same as that which would be exercised by the substance dissolved if it were transformed into a gas and made to occupy alone the space which it occupies in solution (Collander). From the specific gravity of the 'gas' can be ascertained and the molecular weight of the dissolved substance computed. In all these cases there are abnormalities observed, which are due to dissociation of the breaking up of the molecules; these are specially observed in the case of salts and other electrolytic substances. A solution of common salt, \( \text{NaCl} \), for example, contains (Arrhenius) very little combined chloride of sodium, the particles of which are held together by the agency of the mutual attraction of sodium and chlorine, heavily charged with opposite electivities; and the electrolytic conductivities afford additional means of measuring the proportion of the salt which has thus dissociated. Those acids which thus dissociate most into active sub-molecules are the most active. It has also a useful action in breaking up molecules, and causing either dissociation, as in the case of acetic acid, whose molecules are complex until its vapour is strongly heated; or chemical decomposition, as in many well known reactions. Those compounds which have a high molecular weight contain heat molecules which are generally most stable at low temperatures; those which absorb heat during their formation are, as a rule, most stable at high temperatures. When a substance is built up from their constituent molecules in each particular substance and its isomers is a matter now being diligently investigated; the graphic formulæ to be found in all the textbooks of chemistry, and which have been of enormous utility in the systematicatization and discovery of organic compounds, are beginning to give place to 'stereochemical' formulæ, in which the attempt is made to represent the three-dimensional relations of the atoms within the molecule. The forces between molecules vary with their mutual proximity see Maddox, 2nd edn., 1893. Such abnormalities in the obedience of Gases (q.v.) to Boyle's Law under varying pressures and temperatures can be reduced to order by taking instead of \( v \), the whole volume occupied by the gas, a term \( v - \alpha \), the free space within that volume unoccupied by the molecules of the gas; and instead of \( p \), the external pressure, a term \( p + \frac{\alpha}{v^2} \) where \( p \) represents a force of mutual attraction of the molecules. See Ostwald's General Chemistry (1890).

Mole-rat (Spalax), a genus of rodent quadrupeds of the family Muridae, having teeth almost like those of rats, but in many respects resembling mice, as in general form, slowness of movement, occlusion of ears, smallness or even rudimentary condition of eyes, and burrowing habits—although their food is altogether different, consisting wholly of vegetable substances, and chiefly of roots. The mole-rats are almost confined to the African continent and to the oriental region; a few species occur in south-east Russia, Greece, and Hungary. Bathysurus maritimus of the Cape is a large species which inhabits the sand-dunes of the coast.

Moleschott, Jakob, physicist, born at Bouis-le-Duc in Holland, 9th August 1822, studied medicine at Heidelberg, and taught there physiology, on which he wrote two books. He was professor of Physiology at Zurich; in 1861 he moved to the University of Turin, and in 1878 to that of Rome, where he died 20th May 1893. He wrote some twenty works, in German and Italian, on various branches of physiological research, including one on the Natural History of Man and Animals (1855).
Moleskin. See Fustian.

Molesworth, Mrs (Mary Louisa Stewart), novelist and popular writer for the young, was born of Scotch parentage at Rotterdam, and her childhood was passed in Manchester and Scotland, and in Edinburgh. She always lived a good deal abroad. She began to write when very young, and her first attempts were published when she was only sixteen. She was most carefully educated under the superintendence of a very cultivated and accomplished mother, and she owed much to the instruction and direction of the Rev. William Gaskell, husband of the novelist, himself a perfect master of literary style. Her first complete works were written under the nom de plume of Ennis Graham, when she was about twenty-four. These were novels entitled Older and Husband; She was Young and He was Old, Not without Thorns, Cecily, and several years later Hathercourt Rectory and Miss Bowrie. When she was about thirty she began to write for children and was at once successful, and has since held foremost rank in this department. Her children are invariably natural and true to life, they seem like real children, and she has command of an easy and graceful flow of language, which carries the reader pleasantly onward. Her children's stories, which now number more than two dozen volumes, include Tell Me a Story (1858), A Child's History of the World (1858), Her Baby (1851), Rectory Children (1860), The Green Gasket (1860), Children of the Castle (1860). She has also contributed largely to the better class juvenile magazines.

Molesworth, Sir William, the 'liberator and regenerator of Britain's colonial empire,' was born in London, 23rd May 1810, of an old Cornish family, the Molesworths of Penarrow, near Bodmin. He succeeded to the eighth baronet in 1823; studied at Cambridge, at Edinburgh, and in Germany; made the tour of Europe; and sat in Parliament for East Cornwall 1832-37, for Leeds 1837-41, and for Southwark from 1843 till his death on 22nd October 1855, having accepted office in 1835 as First Commissioner of Public Works under the Earl of Aberdeen, and in 1855 as Colonial Secretary under Palmerston. He was the intimate friend of Bentham and James Mill, and was regarded as the parliamentary representative of the 'philosophical Radicals.' He was born in 1810, the Westminster Review was published in 1836, and merged with it the London Review, started a year before by him and Keenick. A great admirer of Hobbes, he edited his complete works (16 vols. 1839-45) at a cost of £6000; but he will chiefly be remembered as having drawn attention to the abuses connected with the transportation of criminals, and as having pointed out the maladministration of the colonial office, investigated the natural relations between the imperial government and the colonial dependencies, and expounded the true principles of colonial self-government.

Molfetta, a seaport and cathedral city of Southern Italy, on the Adriatic, 16 miles by rail N.W. of Bari. Pop. 29,697.

Molière (Jean Baptiste Poquelin, who took this stage-name for reasons not apparent, and every point in whose imperfectly known life has been the subject of elaborate discussion.) was born in Paris in 1622, his baptism is recorded in the Register of St Honoré, and early in the year 1622. The house is not certain, and the exact date is unknown, though it appears to have been about the middle of January. His father was Jean Poquelin, his mother Marie Cressé, and the family came from Béziers, in the Hérault, a Scotch origin which used to be asserted. Poquelin, the father, was a substantial tradesman and valet tapissier de chambre du roi, an officer combining the arrangement with the supply of furniture. The son was well educated, though the precise details of his education are very uncertain. He is supposed to have studied under the Jesuits at the Collège de Clermont, under Gassendi the philosopher, and under the regular teachers of law. He may have been called to the bar. His mother, who had some property, died when he was ten years old, and then when he came of age he received his share of her fortune at once, becoming his own master. He declined to follow up his father's business (though it is said that he had already as his representative attended Louis XIII. on a royal progress as valet tapissier), hired a tennis-court, and embarked in the theatre under the patronage of the Duke of Orléans, and later on that of the cardinal. By 1645 he had formed his company, and was able to manage its returns triumphantly to the capital at the end of that time.

All the pains which have been spent on Molière's history have failed to elaborate any connected or detailed history of these long Wunderjahre. Molière was a marvellous actor and trouper of the French stage; but its range must have been considerable, since it journeyed as far northwards as Rome. The Prince de Conti (said to have been Molière's school-fellow) took it under his protection for a time, and Pézenas, near his LangUEDOCian seat of La Grange, is one of the fixed points of Molière's career. When, Conti having taken to Catholic Methodism, his protection failed, Molière succeeded in obtaining that of the king's brother, Philippe d'Orléans, so that his troup became the servantes de Monsieur. He was most fortunate in his turn in Paris, where he at once received marks of royal favour, played before the king on October 24, 1658, and organised, first in the Petit Bourbon, then, on its demolition, in the Palais Royal, a regular theatre in competition with, if not in opposition to, those of the Hôtel de Bourgogne and the Mazarin. During his sojourn in the provinces Molière had acquired considerable experience as a comic writer. Most of his work had been in a style not far removed from that of the old farces, and of this we have only two relics in Les Plaideurs du Bourgogne and Les Plaideurs. But he had also written L'Etranger and the Dépit Amoureux, and it is, no more probable than that some of his still greater works was at least on the stocks before his return to Paris. As a theatre manager, he had to give tragedy as well as comedy; he is said to have been mistaking as to his own powers of tragic acting, and he had to depend for his tragedies on others, Corneille's Nicomédie, with which he opened, was not a success; and though the other great tragedian of the day, Racine, was a personal friend of Molière, his management was not at all by Molière's fault, brief and unfortunate. But he did not tarry long before showing the immense resources which he possessed in his own talent as a comic writer. Les Précieuses Ridicules, the first essay of the genre, was written in 1659, and was performed at the Petit Bourbon, and was produced by an actor Alphonse Bertin. But, as far as the history of Molière is concerned, from November 1659; and from that time to his death on February 17, 1673, no year passed without one, and few years without more than one, of the greatest achievements in their own particular line that the world has seen. Except the one revolving around the age of Molière (1645-50), and the fourteen busy years is the history of his work as an author, an actor, and a manager. But the one exception is the most important incident of his life. In the spring of 1662 (perhaps on
Molière

St Valentine’s day, perhaps earlier or later, for the exact date, like almost everything else in this history, is disputed! Molière married Armande Gallais as we have shown above, a woman well to her own company, probably about nineteen years old, and the youngest member of the above-mentioned family de Béjart, whereof two other sisters, Madeleine and Geneviève, and one brother, Joseph, had been members of the Iliuste Théâtre. On the proviso that Armande was a model-and the young lady has exhausted itself. It was and still is, in the teeth not indeed of positive evidence, but of something nearly approaching thereto, maintained that Madeleine Béjart and Molière were not only comrades but lovers, that Armande was not Madeleine’s sister, but her daughter, even that Molière himself (this crowning calunnny, it seems, started by the jealousies of Montfleury, a rival actor and playwright) was the father of his wife. Not content with this imputation, later scandal asserted that Madame, or, as the time called her, Madame Catherine de Béjart, was unfaithful to her husband, and contemporary satire asserted that he was at any rate very jealous of her. Of this last there is, both from internal and external evidence, too much probability; of the grave charge there is as in the other, no more than a suspicion. Armande died before the calumny is against it. It may be said before going further that Molière was during his whole life at Paris the butt of vehement animosities, professional and other; that before his death (1670) a sort of play, Éléonore Hypocrite (Éléonore = Molière), appeared, written by a certain Boulanger de Maury, in direct intent to take revenge for Molière’s jests on doctors, which contains much spiteful little-tattle; and that long afterwards, in 1688, a venomous libel on his widow, entitled La Comédie Universelle, threw some mud at him in order to throw mud on her (1688), as he sprang up, composed of stories such as the famous but apparently impossible tale of the en-cou de nuit or cold collection which Louis XIV. shared with Molière in order to overcome the prejudice of his aristocratic suitors de chambre, that of the old woman to whom he is supposed to have read his plays, that (better grounded than the others) of the marquis who, angry at the actor’s satire, rubbed Molière’s head against the sharp buttons of his own coat in a feigned embrace, and so forth. Such authentic denunciation, as the insinuation of the libel, as barely possible, if not above his work, well thought of by good judges, and living well. In August 1655 the king adopted Molière’s troupe as his own servants. In 1667 symptoms of lung disease showed themselves in him, but were for the time checked. On the 17th February 1672 Madeleine Béjart, his comrade of thirty years, if nothing more, died. On the same day next year, after the seventh representation of his last play (see below), Molière died in his own house in the rue de Richelieu of hemmorhage from the bursting of a blood-vessel, having struggled through, as no imaginary sick man, the title-part. He was buried, despite the frowns of the church on his profession and himself, in the churchyard of St Joseph, with unimpaired but not inconceivable ceremony. But the exact tomb has not been identified. He is the first of this type to have a stone erected over him, not a handsome face. His character would appear to have been extremely generous and amiable, though he seems to have certainly suffered from jealousy, and most probably from hypochondria. A pregnant character, and to have lived a far from exemplary life, nothing reported of him, the least excuse for the accusations of irreligion which were brought against him, partly by private malice, partly as retaliation for the terrible attack on religious hypocrisy in Tartuffe, and for the misunderstood irony of Don Juan. The first-named piece was delayed five years before it could be completely played, and Don Juan was stopped and subjected to excisions. Part of Molière’s ill-fame in this respect was no doubt due to the many years he spent (if almost ten) and to his fondness for that teacher’s favourite classic, Lucrèce, whose poem Molière himself is said to have translated as a whole. The dates and titles of Molière’s plays are as follows: L’Étourdi, Le Dîet Amoureux (1638); in the same year providing the young and unaffected with the first taste of comedy and to his fondness for that teacher’s favourite classic, Lucrèce, whose poem Molière himself is said to have translated as a whole. The dates and titles of Molière’s plays are as follows: L’Étourdi, Le Dîet Amoureux (1638); in the same year providing the young and unaffected with the first taste of comedy and

MOLINA

in passages of his more serious pieces. The objection shows a wholly erroneous conception of comedy itself, and may be said to argue deficiency of humor. Molière himself freely allows that side predominates, as undoubtedly as naturally in the earlier plays, the serious in the later. It is not till L'Ecole des Femmes, perhaps not till Le Misanthrope, that the full genius of the author appears; and these two, with Tartuffe, Le Festin de l'Euripide, and Le Malade Imaginaire, have made Molière's name, and perhaps the admirable Bourgeois Gentilhomme as an example of the lower kind, may be said to be Molière's masterpieces. But from the Dijet Amoureux onward no play of his, not even the slightest, is without traces of his admirable wit, his astonishing observation, his supreme power over his own language, his masterly satire. It can hardly be said that any class of men or any prominent trait of mankind is spared by this satire, but undoubtedly three subjects—the vanity and levity of women, the frivolity of the nobles, and the digression into any life. That of Tascherelle, though old, especially of medical men, have the largest share of Molière's lash. He has been accused of taking too low a view of human nature, but this again seems to come from a mistake in appreciating the conditions of his work. He also was and is accused of plagiarisms, and it seems true that he early that, especially he avails himself of existing canvas for his own embroidery freely. The best defence of the practice is the boldest: that any man who can embroidery like Molière does only too well to requisition canvas where and to what extent he likes. Of another, a subtler, and a less easily refuted observation—that, admirable as his criticism of humanity in general is, his characters tend too much to types, and are lacking in the individuality which Dante and Shakespeare give—we have no room to speak fully. Indeed, much more space than can be here afforded would be insufficient to discuss even most briefly the various aspects of his genius.

We must content ourselves with saying that of all French writers he is that one whose reputation stands highest by the combined suffrage of his own countrymen and of foreigners, that his work has been most freely and extensively translated into many languages, and that he is almost everywhere delightful in the study for his wonderful truth to nature and his not less wonderful expertness in method.

As hinted above, the bibliography of Molière is very voluminous. A complete edition of his work was edited in 1682 by his friends and comrades, La Grange and Vinot. The last, and by far the best, complete as to text, with life, lexicography, &c., is that of Despeis and Meurard in the series Les Grands Écrivains Français (13 vols. 1873-96). The bulk of recent work on Molière (for ten years there existed a special periodical called the Molisimite) has not been fully digested into any Life. That of Tascherelle, though old, is perhaps still the best, but the complete is the German Life of Mahrenholz (Heilbronn, 1881). M. Rousseau's Points Obusaire de la Vie de Molière has been a great success in France; an excellent edition of Molière's plays will be found in M. Larroumet's La Comédie de Molière. The Life prefixed to the above-named Grandes Écrivains edition may be regarded as a complete digest of the whole subject; as to which it is impalpable that any new facts will now be found, every source having long since been ransacked. There are excellent editions by Antoine Franco in the 'Collection Lemercier' (7 vols. 1879-82); also M. P. Monod, in the 'Publications de l'Institut de France' (8 vols. 1892). There is a special Bibliographic Molirenaire (1876); and there are translations by Van Laun (1876-77) and Heron Wall (1876-77).

Molina, Luis, a celebrated Spanish Jesuit theologian, was born at Cuenca, in New Castile, in the year 1535, and, having entered the Jesuit Society in his eighteenth year, studied at Cuenca, and was appointed professor of Theology at Evora, where he continued to teach for twenty years. He died at Madrid, 12th October 1600. Molina's principal works are a commentary on the Summa of St Thomas Aquinas (1593); a minute and comprehensive treatise, De Justitia et Jure (1592); and the celebrated treatise on the reconciliation of grace and free-will (Liberi Arbitri cum Gratia Dominii Concordia), which was printed at Lisbon in 1588, with an appendix, printed in the following year. The problem which the latter work is meant to resolve is almost as old as the origin of human thought itself, and had already led, in the 4th century, to the well-known Pelagian controversy (see Pelagius). The reconciliation of the freedom of man's will the predestination of the elect to happiness, and of the reprobate to punishment, Molina asserts that the predestination is consequent on God's foreknowledge of the free determination of man's will, and, therefore, that in no way affects the freedom of the particular actions, in reguital of which man is predestined whether to punishment or to reward.

God, in Molina's view, gives to all men sufficient grace whereby to live virtuously, and merit happiness. Certain individuals freely co-operate with this grace, and, as a result, are in the world; and both courses, and this foreknowledge is the foundation of one or the other decree. This exposition was at once assailed in the schools on two grounds—first as a revival of the Pelagian heresy, inasmuch as it appears to place the efficacy of grace in the consent of man's will; second, as setting aside altogether what the Scriptures represent as the special election of the predestined. Hence arise the celebrated dispute between the Molinists and the Thomists—both of whom, however, maintained that, in all circumstances, the will was free, although they may fail to explain how this freedom is secured under the action of efficacious grace. It was first brought under the cognisance of the Inquisitor-general of Spain, by whom it was referred to Pope Clement VII. This pontiff, in 1529-30, referred the question to Cardinal Dr. Auxiliius to consider the entire question; but, notwithstanding many lengthened discussions, no decision was arrived at during the lifetime of Clement; and although the congregation was continued under Paul V., the only result was a decree (1607) prohibiting both parties from holding either their respective advocates, and prohibiting each party from accusing the adversaries of heresy. The dispute, in some of its leading features, was revived in the Jansenist (q.v.) controversy. Molinism has been commonly taught in the Jesuit schools. See AQUINAS, St. ACHRIS, St.

Molina, Theodoro de See TELLEZ, TELLEZ.

Moline, a city of Illinois, on the Mississippi, 1 ¹ of miles south of St. Louis, W. by S. of Chicago, and separated from Rock Island only by a swift and narrow channel affording good water-power, which is utilised by means of a dam. There are many busy mills and factories here. Pop. (1890) 17,248.

Molinos, Miguel de, was born of noble parentage at Patacina, near Sanguesa, December 12th 1578. He received holy orders, and was educated at Pamplona, and afterwards at Coimbra. At Rome he soon acquired a high reputation as a director of conscience and a master of the spiritual life. An ascetical treatise which he published, under the title of Guida spirituale, was greatly read by the popularity which he had acquired in his personal relations; but there were not wanting many who, in the specious but visionary principles of this work, discovered the seeds of a dangerous and seductive error. Among these the celebrated
MOLLUSCA

MOLISE

Mollusca, a large division of invertebrate animals, including three chief classes: bivalves or Lamellibranchiæ, 'snails' or Gasteropods, and cuttlefish or Cephalopods. As these are separately discussed, it will be enough to state the general characters of the division as a whole.

General Characters.—Though most cuttlefish and not a few gasteropods are free swimmers, the average habit of molluscs tends markedly to sluggishness, and with this the calcareous shell of the great majority is naturally associated. Most of the genera are marine, but there are many fresh-water forms (probably originating 'from the conversion of shallow continental seas into lakes'), while the species of terrestrial snails and slugs are legion. As to diet, the sluggish bivalves feed on microscopic animals and organic debris wafted to the mouth by the gills; the gasteropods are divided into carnivores and vegetarians, omnivorous gluttons and dainty epicures; and the cephalopods are voracious flesh-eaters. In this connection the absence of a rasping tongue in the bivalves, and its presence in all the others should be noticed.

One of the most conspicuous structural characters is the absence of the segmentation and the serial appendages which characterise the arthropods and higher 'worms.' The typical mollusc is bilaterally symmetrical, as may be seen in bivalves and in those gastropods of selical Chiton (q.v.) is a representative, but in the majority of gasteropods the body is markedlylop-sided. This condition is referred by Lankester to the exaggerated vertical growth of the viscera into a dorsal lump surmounted by a shell, which in creeping animals will tend to fall to one side, and thus produce torsion. With the skin, which is soft and glandular, and often eiliated, two very characteristic structures are connected on either side of the mantle, the one a small pit constant in the embryo—the primitive shell-sac or shell-gland; the other a fold of skin overlapping the sides and forming the 'mantle.' From the latter a very varied permanent shell is usually formed as a conchular product composed of lime though the thickness seems often to bear some relation to the external and internal activities of the mollusc, for it is thin in the active scallop (Pecten) and Lima, thick in the passive oyster and Tridacna, slight or absent in the pelagic lteropods (sea-butterflies) and in the vast majority of the Chitons, heavy in most of the slowly creeping littoral forms. But that this is only one condition of shell-development is evident in many ways—for instance, when we compare land-snails with slugs; for the latter, though hardly less sluggish than the former, are practically shell-less, hence the genus 'snail' is not a very distinct structure in the mollusc 'foot,' a muscular protrusion of the ventral surface, usually locomotor in its function, but turned to various uses, and degenerate in the most sedentary bivalves, especially in the pearl-oyster.

As to the less obvious general characters, the nervous system consists typically of a pair of cerebral ganglia, connected to a pair of pedals and to a pair of pleural organs, the latter associated with a visceral nerve-loop which may also be ganglionated. In the cephalopods, and for the most part in the bivalves, the three chief pairs of nerve-centres are closely united in the head, but in the symmetrical chitons a much more primitive, and in the bivalves a much less concentrated arrangement obtains. The sense-organs vary greatly, but there may be tentacles like the sea-anemone, heads, 'beaks,' homologous to the well-developed in most cuttle-fish, while a pair of ear-sacs or otocysts in the front of the foot and a smelling-patch or ophryodrum at the base of the gills are all but constant. On the edge of the mantle of many bivalves, or penetrating the shell-plates in Chiton, there is always a pair of ciliated organs, some of which are imperfectly visual and possibly light-absorbing in function. The foot-oval includes in the mouth-region a toothed ribbon, absent in bivalves, and bears further inack a digestive gland often of large size. The mantle secretes the shell, is depressed ventrally into the foot of bivalves, and are protruded as if in a herm in the dorsal surface of most gasteropods. The heart, absent only in Dentalium and related genera, lies dorsally in a special portion of the body-cavity known as the pericardium, and drives colourless blood through the body, thence into the gills and kidneys, whence it returns purified. The gills are vascular outgrowths of the body-wall, usually sheltered by the mantle, which in the terrestrial forms like the snail makes a lung-like chamber. A paired or single kidney connects the pericardium with the exterior. The reproductive organs—unisexual or hermaphrodite—vary extremely, from great simplicity in most bivalves to an extraordinary degree of complexity in many gastropods, such as the snail.

In their life-history most molluscs pass through two larval stages. The first is a somewhat barrel-shaped form, with a ring of cilia in front of the mouth; it is known as a trochosphere, and is quite like the young stage of many 'worms.' This passes, however, into another more characteristic stage called the veliger, which bears on its back a ciliated area or locomotor 'velum' often produced into lobes, has its body already characterised by a visceral lump and a ventral foot, and possesses on its dorsal surface the little shell-gland already mentioned. In the cephalopods, whose ovae are rich in yolk, the trochosphere and veliger stages are skipped over, and there are also notable
modifications in the development of terrestrial and fresh-water molluscs.

Classification.—Branch A. Those with a well-developed head and a rasping tongue: Class I. Cephalopoda (q.v.). See also Cuttle-fish, Nautilus. Class II. Gasteropoda.—(a) More or less asymmetrical forms (see Gasteropoda, also Limpet, Snail, Whelk, &c.); (b) Symmetrical and primitive forms—e.g. Chiton (q.v.); (c) A distinct sub-class of pelagic forms, the Pteropoda (q.v., sometimes called a class, or united with Class I.). Class III. Sepiopoda.—A few very distinct forms, of which Dentalium (q.v.) is the best-known representative. Branch B. Those in which the head-region is very slightly developed, and without a rasping tongue: Class IV. Lamellibranchiata or Bivalves (q.v.). See also Mussel, Oyster, &c.

History.—Provided as most molluscs are with substantial calcareous shells, their fossil remains have been to that extent very perfectly preserved, and long series have been traced out with remarkable success. Remains of the great types occur even in the Cambrian rocks, and more abundantly from the Lower Silurian onwards. The earliest Nautilus type of cephalopod has wandered away through the ages, and only one genus (see Nautilus) now persists, while the cuttle-fish type which appeared much later is still represented by numerous species. As a whole, however, this class seems to have dwindled, for there are towards 4000 fossil species—distributed of course over many ages—as against less than 200 living forms. With the gastropods, however, the case has been very different, for the number of genera steadily increases from the Cambrian and Silurian onwards, and of the total number of species, computed some years ago at 22,000, the extinct forms are estimated at 7000, the living forms at 16,000, which proves beyond doubt a notable increase in numbers. Nor can we deplore any modern diminution of lamellibranchs, for, although the extinct species are reckoned at about 8000 and the living at about 5000, the former were distributed over a much vaster period, while in some families the number of living species greatly exceeds that of the extinct. As one would expect, the lung-breathing gastropods and the fresh-water lamellibranchs are both relatively late in appearing.

As to the pedobranchs, some of the characters of the chiton-like gastropods and the general occurrence of a trochosphere larva suggest the origin of molluscs from some worm-like type, but this is not saying much. Very helpful has been Professor Ray Lankester's attempted reconstruction of the ancestral or archi-mollusc, from which all the early divided into two series, the sluggish bivalves, with many structures (e.g. the atrophied head) modified in relation to a sedentary life, and the active aggressive gastropods and cephalopods, in which the general features of the archi-mollusc are more evidently retained.

As the economic importance of molluscs is recognised in special articles (such as those on Bivalves, Cuttle-fish, Gasteropoda, Mussel, Oyster, Snail, Whelk, &c.), we shall simply illustrate in conclusion their general zoological interest. For a long time the study of molluscs hardly penetrated beyond their shells; but, through this Coenology (q.v.) was often a collecting craze, and sometimes led to positively misleading conclusions, no one will dispute the charm of beauty and variety which these externalities possess, nor deny that their investigation rightly pursued (in relation to the tenating animals and the surrounding conditions of life) may yield most important scientific results. It is very interesting also to consider how the limits of Mollusca have been gradually changed. As the original title, Malakia, means soft, it is necessary to explain that Aristotle applied it solely to the practically shell-less cuttlefishes, while Linnæus used the Latinised term Mollusca also in primary reference to naked forms, along with which he included, however, hyroids, annelids, and echinoderms. The shelled molluscs which form the majority of the modern classes he separated off as Testacea. But strangely enough this last title was gradually replaced by Mollusca, under which Cuvier included not only cephalopods, gastropods, pteropods, and the 'acéphales' or headless bivalves, but the lung-breathers or cuttlefishes, the Nudibranchiata, and the barnacles or Cirripedia. In modern times, as a reference to the articles on Bivalvia, Ascidinidæ, and Cirripedia will show, the researches of Vaughan Thompson, Kowalevsky, Milne-Edwards, and others have entirely freed the class of molluscs from Cuvier's last three divisions. The incomparably careful anatomical work of Lacaze-Duthiers, along with the researches of Kölliker and Gegenbaur, Huxley and Spengel, the embryological discoveries of Ray Lankester and others, and the generalisations which we owe to Huxley and Lankester are notable illustrations of recent progress in the study of molluscs. Moreover, on the problems of evolution no little light has been cast—e.g. by Würtemberger's comparison of the racial and individual development of the Ammonites, by Hyatt's monumental monograph on the evolution of fossil cephalopods, or even by the single chapter in which Hilgendorf worked out the variations of Planorbis in the Upper Miocene beds of Steinheim. In other directions, too, the inquiries of Dall and others into the deep-sea molluscs, the experiments by which Semper was able to impress changes upon various forms by altering their surroundings, Sollas's research on the origin of fresh-water fauna, Lang's study of the influence of sedentary life, Bateson's account of the variations of the cockle, and many other evolutionist investigations have yielded results not less valuable than those of the anatomists.
Moltke, a village of Prussian Silesia, 7 miles SW. of Bries, an obelisk (1878) marks the battlefield where Frederick the Great with 20,000 Prussians defeated an equal number of Austrians under Marshal Neipperg, April 10, 1741. The Austrians lost 5340 men, the Prussians 5500.

Molly. See Pulmar.

Molly Maguires, an Irish secret society which during the ten years preceding 1877 terrorised the coal regions of Pennsylvania. The name was imported from Ireland, where it had been adopted by a branch of the Ribbonmen whose outrages by night were perpetrated in female disguise (cf. Trench’s Realities of Irish Life, p. 82). The object of the organisation in Pennsylvania appears to have been to secure for its members, as far as possible, the exclusive power in the coal-mining parts of the state. Murders were committed in the open day, though much more usually by night; and the terror of the society was on all the coal country until, in 1876-77, a number of the leaders were convicted and executed, mainly by the evidence of a detective named McFarlan, who had acted for three years as secretary of the Shanandoah division. See works by Pinkerton (New York, 1877) and Lucy (Lond. n.d.).

Moloch, or more properly Molech, is mentioned in 1 Kings, xi. 7, as the ‘abomination of the children of Ammon,’ and occurs frequently elsewhere in the Old Testament as the name of a divinity occasionally worshipped in the kingdom of Judah with cruel rites. The Hebrew form of the word is invariably Molech, and it always (except perhaps in 1 Kings, xi. 7) has the article (‘the Molech’); the occasional variant Moloch in the Authorized Version has come through the Septuagint and Vulgate. The word means ‘king,’ and is the same (molech) as that which appears in composite form in the names of the divinities Adrammelech and Anammelech (2 Kings, xvii. 31), in the title Melkarth (Millochites) applied to the Tyrian Baal, and in a large number of compound divine names in Semitic inscriptions; the change from Molech to Moloch is due to the later Jews, who gave the word in this connection the vowel-points of Besheth (‘molechful thing’; cf. Mephiboseth, Mephibosaic). Of Moloch as a deity of the Ammonites nothing special is recorded, and it is improbable that in 1 Kings, xi. 7, the only place where he is spoken of as such, the kindred word Milcom or Malem ought to be read (see the LXX. and compare 1 Kings, xi. 5, 33; 2 Kings, xxiii. 13; Jer. xlix. 1, 3; Zeph. i. 5); in any case the worship of the Ammonite deity in the days of Solomon was essentially distinct from the Moloch worship which at a later date came to be practised in Judah, especially in times of great calamity. The kindred practice of child sacrifice and worship of Jehovah ‘making his son to pass through the fire to Moloch’ is that of Alah (2 Kings, xvi. 3). The same story is told of Manasseh (2 Kings, xxvi. 6), and that the practice had become a common one in the course of the 7th century is shown by frequent allusions in Jeremiah, Ezekiel, and the Book of Leviticus. The victims were slain at the sanctuary (Jer. xix. 4), and afterwards burned as holocausts on a ‘tophet’ or pyre in the valley of Hinnom (Ge-Hinnom, Gehenna) near Jerusalem (2 Kings, xxix. 10; Jer. vii. 31, 32; xix. 6, 13, 14); the often quoted description by Rabbincine writers of a calf-headed brazen image of Moloch, in which the children were burned alive, is mere invention. On the general question of the origin of human sacrifices, see SACRIFICE. It is probable that the ritual of Moloch worship was borrowed by the people of Judah from one or other of the surrounding nations; it was practised, we know, by the Moabites (2 Kings, iii. 27). At Jerusalem it has been held that it was intended to propitiate Jehovah, regarded as the national ‘Moloch’ or ‘Baal’ or ‘King,’ though the prophets speaking in Jehovah’s name constantly denounced it as unsanctioned by Him (see Jer. vii. 31; xix. 5). See Baudissin’s monograph, J h e i e t M o l o c h (1874).

Moloch (Moloch horridus), an exceedingly spiny Australian lizard, covered all over with horned warts and sharp spines, which give it a quaint if repulsive appearance, concealing, however, an inoffensive character. It is sluggish in its movements, attains a length of 10 inches, and is found chiefly in South and West Australia.

Mologa, a town in the Russian government of Jaroslaw, near the confluence of the Mologa and Volga, 68 miles W.N.W. of Jaroslaw. Pop. 6381.—The river Mologa winds 337 miles south-eastward through the governments of Tver, Novgorod, and Jaroslaw, and is one of the links between the Volga and the Neva.

Molokai (the Lepers’ Island). See HAWAI.

Molossians, the most important people of ancient Epirus (q.v.).

Moltke. HELMUTH, COUNT VON, field-marshal of the German empire, who as chief of the general staff at Berlin planned the Prussian campaign of 1866 against Austria, and the German campaign of 1870-71 against France. He was born 26th October 1800, at Parchim in Mecklenburg-Schwerin, his father being a general in the Danish army, of a good old family and considerable wealth. In 1812 he was, with his only brother, sent to the military academy at Copenhagen, where he remained under the strictest discipline for six years, and distinguished himself in the scientific branches of military study. In 1819 he became lieutenant in a Danish regiment, but on the separation of Denmark from Norway he determined to retire from the Danish and enter the Prussian service. This change being effected, he passed the necessary examinations, and entered a Prussian regiment at Frankfort. His parents having by this time lost the whole of their property from war and misfortune, he had to undergo many hardships in order to maintain himself on the slender pay of a Prussian officer, and at the same time obtain instruction in various foreign languages. In 1832 Moltke was appointed to the staff, and for three years he continued to develop by scientific and exact study his extraordinary powers of combination and organisation. He then obtained leave to travel, and, arriving in Turkey at a critical moment, he was
entrusted by the sultan with the task of remodeling the Turkish army, and remained with Mahmoud II, as military adviser till October 1839, when he returned to his old position at Berlin. From 1838 to 1888 he was chief of the general staff in Berlin, and he at once commenced the reorganisation of the Prussian army. He also elaborated plans for the defence of the German coasts, and the creation of a German navy. His wonderful strategical power was displayed in the wars with Denmark in 1864-65, with Austria in 1866, and with France in 1870-71, bringing him all to triumphant issues. He married in 1845 the daughter of an English gentleman residing in Holstein, but had no family. Known as 'The Silent,' he was a man of great modesty and simplicity of character. His ninetieth birthday was the occasion of numerous honours. He died 13th April 1891.

He wrote a series of letters from Turkey, and an account of the Russian campaign in Turkey in 1839 was published in 1841. His Letters from Russia, written in 1836 to his wife, were published in 1877 (Eng. trans. 1878). Two other letters, campained in 1869, the Danish-German war, the Austro-Prussian war, and of the Franco-German war were prepared by the general staff under his direction. In 1891-93 an edition of works, with a vouched, containing a biography, a novel, a short history of the Franco-German war (Eng. trans. 1892), letters to his mother and brothers (Eng. trans. 1892), speeches and reminiscences.

See also Lives by Wilhelm Muller (Eng. trans. 1879), F. von Koppen (1888), Muller-Bohn (1889), and others.

**Molucca Beans.** See Guilandina.

**Moluccas.** (also called Spice Islands), the easternmost division of the Malay Archipelago, comprising most of the islands between Celebes and New Guinea west and east, and between Timor and the Philippines south and north. Originally the term Moluccas was applied by the Portuguese only to the small islands (Ternate, Tidor, &c.) west of Jilolo, which are now known as the Little Moluccas; but it was gradually extended to Jilolo itself, to Buru, Ceram, and all the spice-growing islands of the eastern seas, which, with parts of Celebes and New Guinea, now form politically the three chief divisions of the Sunda Archipelago, namely, Buru, Ceram, and Banda, and which physically fall into the two groups of the Northern Moluccas, disposed in the direction from north to south, and the Southern Moluccas, running mainly west and east. The northern group, which is surrounded on all sides by the greater ranges of Banda, and which physically falls into the two groups between the Moluccas and Jilolo passes west and east, and comprises Morotai (Morty) and Rau (Ihoo) in the north, Jilolo, Ternate, Tidor, and other islets in the centre, Batchian (Matjan), Tawal, Mandelio, and Great and Little Olh (Oly) in the south, with a total area of nearly 10,000 sq. m. of which Jilolo has 7000, Morotai 1100, and Batchian 850. The population is vaguely estimated at 60,000, of which nearly half are concentrated in the small but politically important islands of Tidor and Ternate, with respective areas 45 and 23 sq. m.

The Southern Moluccas are connected by a sub-marine bed of less than 100 fathoms westwards with Sula and Celebes, but are separated from the northern group by an abyss of over 1500 fathoms, and are divided into the southern and the northern (near the Banda volcano) of over 4000 fathoms. They comprise the two large islands of Buru (8000 sq. m.) and Ceram (7000), the small Ambonaya, Uliisser, Banda, and Ceram Laut sub-groups, the out-lying Ké (Kei) and Aru clusters, with some other islets scattered over the neighbouring waters, with a collective area of 16,500 sq. m., and an estimated population of 350,000, of which 200,000 are in Ceram, 60,000 in Buru, 30,000 in Ambonaya, 26,000 in Uliisser, and 6000 in Buru. Thus the Moluccas, taken in the widest sense, have a total area of over 26,000 sq. m., and a population of probably not much more than 350,000, or 1000 per sq. m., in a country civilised by Malays, in the Little Moluccas, Bandu, and Ambonaya, elsewhere the so-called 'Alfuros'—i.e. uncivilised or non-Mohammedan natives, some Indonesians, some true Malays, some mixed Malayo-Paumans (see Malaya).

The Moluccas lie mostly on the line of the great volcanic fault, which sweeps round in a vast curve from Sumatra to the Philippines and Japan, and which in the Moluccas is indicated by the still active Gunong-Api (1870 feet) in Banda, Tidor (5730), Ternate (5650), Motir (2800), three cones in Jilolo, Tido in Motoral. Api was the scene of a terrific eruption accompanied by earthquakes in 1825; Ternate is one of the most restless volcanoes in Malyasia; and several other cones appear to be of relatively recent date. For ages the whole region has been subject to small convulsions, which have reduced it to its present fragmentary state. At a remote geological epoch it probably formed part of Celebes and the Philippines, a supposition by which are best explained the many features possessed in common by the natural history of these nations. The picturesque Morotoi was certainly at one time connected with Jilolo, and were the connection restored the resemblance would be complete between the curiously shaped islands of Celebes and Jilolo, which have been compared to a mutilated starfish. Jilolo, also called Harmahara, or the 'Great Land,' largely consists, like Ceram and Buru, of crystalline or metamorphic and very old sedimentary (coraline limestone) rocks, whereas Ternate, Tidor, Banda, and the smaller members of the group are partly igneous, partly coralline origin.

Despite the tropical position the island is nearly bisected by the equator, the Moluccas enjoy a relatively healthy climate, and in some places the European race (Portuguese and Dutch) has even been acclimatised. The excessive heats are everywhere tempered by sea-breezes and by the mountainous character of the islands, and though Ceram rise to heights of 8000 and even 10,000 feet. In the Southern Moluccas the north-east trades prevail from May to October, and are accompanied by heavy rains and thunderstorms. They are followed by the west monsoon, which has already discharged most of its energy, and in both islets and islands and islands in the north the regular winds become intermingled, with the result that the seasons are here extremely variable, fine and wet weather alternating throughout the year. But the temperature oscillates everywhere within very narrow ranges, seldom rising above 85° or falling below 75° F. on the coast-lands. Rainfall, 150 inches at Ambonaya.

Indigenous to most parts of this region are the clove, nutmeg, and other spices, although these plants are now cultivated only in Ambonaya and the Banda group; elsewhere they are being dispossessed by the Dutch government with the view of increasing the value of the Banda plantations, and preserving the monopoly of the spice trade. Other valuable plants are the sago-palm, which supplies the staple food of the Moluccas; the pandanus, remarkable for its aereal roots, the kanyut nut, dammar pine, &c.

In its fauna the Molucca group is connected with Celebes by the babirousa hog found in Buru, and with New Guinea by the bird of paradise (Bat-chian), the marsupial eucos and flying eucos, and by the surrounding seas. Here are also found the cassowary, the Australasian megapodus, and moul-building bird, the crimson lor, the ratchet-
tailed kingfisher, and numerous species of parrots and pigeons noted for their gorgeous plumage. Insects, such as the long-winged beetle of Ambonya and several butterflies, here attain their largest size and display their brightest colours. The shell-books of the tropical southern group, are also noted for the vivid hues of the shell, sponges, shells, and corals covering the bed of the sea, and for the immense number of their fishes.

Notwithstanding their small size, Ternate and Ti dor have always been the chief centres of political power in the Moluccas, and Ambon and, in the southern Moluccas. These islands have long been occupied by civilised Malays, who easily asserted their supremacy over the surrounding lands, which are inhabited chiefly by rude wild tribes at a low stage of culture. Formerly the Mohammedan sultans of Tidor and Ternate were among the most powerful rulers in Malaysia, their dominions stretching westwards to Celebes and eastwards to New Guinea, and comprising all the intermediate islands. It was as heirs to these potentates that the Dutch claimed all the western part of New Guinea, as far as the 141st meridian. For the present Dutch residency of Ternate includes that part of East Celebes which is watered by the Gulf of Tomini, together with the adjacent islands. In Ternate is still central most of the trade of the numerous islands, which export coral, shell, trepang, beeswax, bark, and birds of paradise in considerable quantities. The residency of Ambon, one of the oldest Dutch settlements in the East, comprises the whole of Baru, the western half of Ceram, and all the neighbouring islets. In the town of Ambon, capital of all the Dutch possessions in the Moluccas, classes on a flourishing export trade in cloves, of which half a million pounds have been raised in favourable years in the famous clove-gardens belonging to the government. Bandja, the third Dutch residency, comprises, besides the Bandja group (Great Bandja, Ap, Neira, and Pisasang), a large part of Ceram, the Ke and Aru groups, Timor Laut, and the Serrati Archipelago. Bandja is the true home of the nutmeg, which here grows naturally, and arrives at the port in the harvest season, which on the slopes of all the volcanic islands, which are disposed in an irregular basin like the fragments of some disrupted crater. Neira or Bandja, called also Nassan, seat of the residency, occupies the southern extremity of Neira Island on the north side of the basin over against Ceram. In the middle of the nautical mile, Banda yields sago and cocomuts for the export trade, which has long been monopolised by the so-called "Perkeniers," descendants of Europeans settled in this group since the beginning of the 17th century, and now perfectly acclimatised.

Molybdenum (sym. Mo; atomic weight, 96; sp. gr. 8-42) is a rare metal, which, in a state of purity, is of a silvery white colour, has a strongly metallic lustre, is brittle, and very difficult of fusion. It occurs native, and its principal ore is the molybdenite, or molybdanum, which is a black, metallic, mohre, or molybdite. It is also occasionally found oxidised, in molybdane of lead. The metal may be obtained by roasting the molybdenite in a free current of air, when the sulphur is driven off sulphur dioxide, and the metal is oxidised into Molybdenic Acid (MoO₃), and remains in the state of a potassium compound, and on reduction by charcoal, the reduced metal is then obtained from the acid. Molybdenum forms three compounds with oxygen—the protoxide (MoO₂), the binoxide (MoO₃), and molybdic acid (MoO₄). Of these three the last alone has any practical value. Molybdenic acid is a white, glistening, crystalline powder, which is sparingly soluble in water, fuses at a red heat to a straw-coloured glass, and unites with bases to form well-marked salts, the molybdates, which are red and yellow, or green in solution in alkalis. A solution of molybdate of ammonia is one of the most delicate tests for phosphoric acid. Molybdenum forms various compounds with sulphur, chlorine, &c., none of which are of any practical importance, except the native bisulphide.

Mombasa, or Mombaz, a seaport and the head-quarters of British East Africa (till 1895 of the I.B.E.A. Company), stands on a coral island 3 miles long by ½ mile broad close to the coast, in 4° 8' S. lat., about 150 miles N. of Zanzibar. The shores of the island are rocky and abrupt, and the greater part of its surface is covered with dense bush. The town has the usual Arab characteristics of ruin and neglect, and the subjects of war and salt are extensive, built in 1594 by the Portuguese, and abandoned by them in 1633. Mombasa was visited by Vasco da Gama in 1497; it was then a large and prosperous town (as it was when Ibn-Battûta was there in 1331), with a colony of Christians of St Thomas and Basutian origin. It was sacked by the Portuguese during the greater part of the period from 1565 to 1689, though not without frequent captures. The native chief put it under British protection in 1823; but, they soon abandoning it, it was seized by the sultan of Zanzibar, who in 1888 ceded it provisionally to the British East Africa Company. The town was made a military station in 1890 and became a seaport. Zanzibar, and it was on the frontiers of the Congo Free State—an area of 700,000 sq. m., more than six times the size of Great Britain and Ireland together. Gold, copper, plumbago, and iron ore, as well as indiarubber, exist in this region in considerable abundance. The company has connected Mombasa with Zanzibar by telegraph, and in 1890 commenced a railway inland to Victoria Nyanza, a distance of 600 miles. The harbour, one of the largest, safest, and healthiest on the east coast of Africa, was in 1890 made a British naval coal station, and the headquarters of the British East Africa Forces were here. There is a pier; and other harbour-works were begun in 1890. Pop. about 20,000, mostly Africans, with some Arabs and Banyans. On the mainland opposite is Frere Town, the see of the Anglican bishop of East Equatorial Africa.

Moment of a dynamical quantity is the importance of that quantity in regard to its dynamical effect relatively to a given point or axis. The most familiar example is the Moment of a Force. For simplicity, take a body movable about a fixed axis—say, a door on its hinges. Everyday experience teaches us that such a door is most easily moved by a push or pull applied as far as possible from the hinge. In moving the door slowly through a certain angle, we must do so much work in, first, causing the necessary acceleration, and in overcoming the friction of the hinges. If we apply the force at a greater distance from the hinge, it works through a proportionately greater force, and is therefore proportionately less. Such considerations lead to the general equation of the moment of a force about a point as the product of its amount into its perpendicular distance from the point. The
tendency of the action of such a force is to cause rotation about an axis perpendicular to the plane passing through the point and containing the force. Thus, in the case of a pendulum, the effectiveness of the force of rotation is measured by the moment $W$, where $W$ is the weight of the pendulum, and $J$ is the distance of the line of action of the force $W$ from the centre of rotation $C$, or (what comes to the same thing) the distance of the centre of mass $G$ from the vertical line through $C$.

The term moment enters into several other phrases, all of which relate either directly or indirectly to rotation. Thus, there is the moment of momentum, or angular momentum, whose rate of change is the measure of the moment of the force producing the change. To obtain it for any given body rotating with angular speed $\omega$ about an axis, we first imagine the body broken up into a great many small portions of masses $m_1, m_2, \ldots$, &c., at distances $r_1, r_2, \ldots$, &c., from the axis, multiply the momentum $(m_1r_1, m_2r_2, \ldots, &c.)$ of each mass by its distance, and then take the sum of all these products. The angular speed $\omega$ being the same in every expression, the moment of momentum takes the form

$$\sum m_i r_i \omega.$$  

The quantity $\sum m_i r_i$ is the moment of the total axial acceleration of the body, and is called the Moment of Inertia about that axis. It is the factor in the moment of momentum, which depends upon the distribution of matter in the body. It enters into all questions of mechanics in which rotation is involved, from the spinning of a top or the motion of an engine governor to the stability of a ship. By an obvious extension, the word moment is also used in such combinations as moment of a velocity and moment of an acceleration. Such phrases correspond to nothing truly dynamic, and involve the idea of unit mass, unit of momentum of unit mass, and acceleration as the rate of change of that momentum. See Dynamics, Force, Inertia, Rotation, &c.

**MOMENTUM** is our modern equivalent of Newton's quantity of motion ($quantitas motus$), which in medieval Copernican astronomy, and is to be distinguished from the product of the velocity and the mass. Its dynamic importance is sufficiently discussed under Force.

**MOMIEN, a** Chinese frontier-town in the extreme west of Yunnan, 135 miles NE. of Bhamo. See Anderson's *Mandaley to Moniien* (1876).

**MOMMSEN, THEODORE, the** most learned historian of Rome, was born the son of a pastor at Garding, in Sleswick, 30th November 1817. He studied at Kiel, next spent three years traversing France and Italy in the study of Roman inscriptions under commission of the Berlin Academy, edited while the *Schlesisig-Holsteinische Zeitung*, and in the autumn of 1848 was appointed to a chair of Jurisprudence at Leipzig, of which two years later he was deprived for the part he took in politics. In 1852 he was appointed to the chair of Roman Law at Zurich, in 1854 at Breslau, and in 1858 to that of Ancient History at Berlin. Here he was engaged for many years in editing the monumental *Corpus Inscriptionum Latinarum*, projected by the Berlin Academy, and commenced in 1863; and for the last 20 years has been connected with the Academy. In 1882 he was tried for slandering Biurück in an election speech, but was cleared both in the lower court and in that of appeal. His fine library was burned in 1886, whereupon a number of his rich students presented him with a collection of books to make good at least part of his loss. MommSEN took a share in the work of editing the *Monumenta Germaniae Historica*, and has made his name illustrious by a series of works of vast range and profound erudition. His greatest work remains his *Römische Geschichten*, brought down to the battle of Thapsus (3 vols. 1834–56; 5th ed. 1879; English translation by W. W. Howitt 1875). These three volumes form books i.–v. of MommSEN's plan; vol. v., forming book vi., was issued in 1883 (Eng. trans. by Dickson, The *Provinces of the Roman Empire from Cesar to Diocletian*, 2 vols. 1886). Freeman characterizes MommSEN as 'the greatest scholar of all times . . . language, law, mythology, customs, antiquities, coins, inscriptions, every source of knowledge of every kind—he is master of them all.' But, while admitting readily his wide and sure grasp of historical sequence, the reader finds MommSEN defective in political and moral insight, and prone to fall down in worship before mere force and success.

Other important works of MommSEN's are *Ostische Studien* (1845); *Die Unterrichtlichen Dialekte* (1850); Corpus *Inscriptionum Neapolitanarum* (1851); his monographs on Roman Coin (1836); the edict of Diocletian, *De Pretiis Rurum Venalium* (1851); *Die Rechtsfragen zwischen Cesar und dem Senat* (1857); *Romische Forschungen* (1849–79); *Lex Laevni Divi Augusti* (1863); *Romisches Staatsrecht* (1875); *Die Lehre vom Augsten* (1876–79); and *his Digesta Justiniani Augusti* (1860–70).

Of his brothers, two have achieved distinction: Tycho, born at Garding, 23rd May 1819, studied at Kiel, traversed Italy and Greece, and held educational appointments at Eisenach, Oldenburg, and Frankfort-on-Main until his retirement in 1885; he died in 1900. He produced a great critical edition of Pindar in 1884 (an edition of the text in 1866), *Scholien* (1861), a translation (1846), and *Poezie Pindarove* (1877).

**MOMPÓX, or MOMPOX, a** town of Bolivar in Colombia, on the Magdalena, 110 miles SE. of Cartagena. Founded in 1538, it contains a good secondary school and a distillery. Pop. 8000.

**MONACHISM, or MONASTICISM** (Gr. *monachos, a monk, from monos, alone*), may in general be described as a state of religious retirement, more or less complete, accompanied by contemplation, and by various devotional, ascetical, and penitential practices. It is, in truth, Asceticism (q.v.), with the element of religious solitude superadded. The institution of monachism has, under different forms, entered into several religious systems, ancient and modern. That it was known among the Jews before the time of Christ appears from the example of the prophet Elijah and from that of the Essenes; and it is probable that religious seclusion formed part of the practice of the Nazarites, at least in the later periods of Jewish history. In the Brahmanical religion it played an important part, and on the conquest of the west the monasteries of Tibet may be said to rival in number and extent the former monasteries of Italy or Spain. The Christian advocates of monachism find in the exhortations to voluntary poverty (Matt. xix. 21) and to celibacy (1 Cor. vii. 37) the once the justification and the origin of the primitive institution. Its first form appears in the practice of Asceticism, of which we find frequent mention in the early part of the 2d century.
The primitive ascetics, however, lived among the heathen, and it is only in the following century that the peculiar characteristic of monachism begins to appear. The earliest form of Christian monachism is also the most complete—that of the Anchorites or Hermits (q.v.)—and is commonly believed to have in part originated in the persecutions, from which Christians were driven into desert and solitary places. The hermits maintained from choice, after the cessation of the persecutions, the seclusion to which they had originally resorted as an expedient of security; and some of them, such as St. Anthony, St. Paul the Egyptian, St. Simeon Stylites, etc., have been held to have founded the name Louara, with a common church, in which all assembled for prayer and publication. From the union of the common life with personal solitude is derived the name cenobite (Gr. κοινός θῆς, common). This class of monks is distinguished from the strict solitary, as the hermit, and in which is involved, in addition to the obligations of poverty and chastity which were vowed by the hermits, a third obligation of obedience to a superior, which, in conjunction with the two former, has ever since been held to constitute the essence of the religious or monastic life. The first origin of the strictly cenobitical or monastic life has been detailed under the name of St. Antony (q.v.), who may be regarded as its founder in the East, either by himself or by his disciples. So rapid was its progress that his first disciple, Pachomius, lived to find himself the superior of 7000. In the single district of Nitria, the country of the Natron Lakes (q.v.) in the Egyptian delta, there were, according to Sozomen, no fewer than fifty monasteries, and before long the civil authorities judged it expedient to place restrictions on their excessive multiplication. It seems to be admitted that in the East, where asceticism has always been held in high estimation, the example of Christian monasticism had a powerful influence in forwarding the progress of Christianity; although it is also certain that the admiration which it excited occasionally led to its natural consequence among the members, by eliciting a spirit of pride and ostentation, and by provoking volatilities to fanatical and sometimes to hypocritical simulations of rigor. The abuses which arose, even in the early stages of monachism, are deplored by the very Fathers who are most eloquent in their praises of the institution itself. These abuses prevailed chiefly in a class of monks called Sarabatai, who lived in small communities of three or four, and sometimes even of a single individual. On the other hand, a most extraordinary picture is drawn by Theodoret of the rigor and mortification practised in some of the greater monasteries. The monks were commonly zealous in the propagation of the faith, and the elucidation of religious controversies of the East was due to that unrestrained zeal; and it may be added that the opinions which led to these controversies originated for the most part among the theologians of this class. The opinions of the "Lieutenants" or "Acacizae" (Gk. Λυτεκαι, 'sleepless'), from their maintaining the public services of the church day and night without interruption (see GREEK CHURCH).

It was in the cenobitic rather than the eremitical form that monachism was likely introduced into the West, at Rome and in Northern Italy by Athanasius, in Africa by St. Augustine, and afterwards in Gaul by St. Martin of Tours. Here also the institution spread rapidly under the same general forms in which it is found in the Eastern Church; but considerable was the tax of facts in the Western, and it was not until the thorough reformations and, as it may be called, religious revival effected by the celebrated St. Benedict (q.v.), in the beginning of the 6th century, that western monachism assumed the form of the Rule prescribed by him. In some of the more isolated churches, as, for instance that of Britain, it would seem that the reformations of St. Benedict were not introduced until a late period; and in that church, as well as in the church of Ireland, they were a subject of considerable controversy. One of the most important modifications of monachism in the West regarded the nature of the occupation in which the monks were to be engaged during the times not directly devoted to prayer, meditation, or other spiritual exercises. In the East manual labour formed the rule; but in the West the Rule prescribed by the monks was less penal and more the nature of the main business of life was the sanctification of his own soul. In the West, besides the labour of the hands, mental occupation was also prescribed—not, as true, for all, but for those for whom it was especially calculated. From an early period, therefore, the monasteries of the West, and particularly those of Ireland or those founded by Irish monks (see COLUMB, CULDEES), as Iona and Lindisfarne, the famous schools of learning, and training-houses for the clergy. At a later period most monasteries possessed a scriptorium, or writing-room, in which the monks were employed in the transcription of MSS.; and, although a great proportion of the work so done was, as might naturally be expected, in the department of sacred learning, yet it cannot be doubted that it is to the scholars of the cloister we owe the preservation of most of the masterpieces of classic literature which have reached our age.

In the remarkable religious movement which characterised the church of the 12th century (see FRANCISCANS) the principle of monachism underwent a further modification. The spiritual egoism, so to speak, of the early monachism, which in some sense limited the work of the cloister to the sanctification of the individual, gave place to the more comprehensive range of spiritual duty, that, in the institute of the various bodies of Friars (q.v.) which that age produced, made the spiritual and even the temporal necessities of one's neighbour, equally with, if not more than, one's own, the object of the work of the cloister. The progress of these various bodies, both in the 12th century and since that age, is detailed under several titles. The monastic institutes of the West are almost all offshoots or modifications of the Benedictines (q.v.); of these the most remarkable are the Carthusians, Cistercians, Cluniacs, Premonstratensians, and these have all been dealt with fully. In more modern times other institutes have been founded for the service of the sick, for the education of the poor, and other similar works of mercy, whose members are also classed under the denomination of monks. The most important of these are described under their several heads.

The enclosure within which a community of monks reside is called a Monastery (q.v.), and sometimes convent. By the strict law of the church, each cloister is to be entered only by the prior to all except members of the order to enter a monastery; and in almost all the orders this prohibition is rigidly enforced as regards the admission of
females to the monasteries of men. To such a length is this carried in the Greek Church, that in the celebrated enclosure of Mount Athos not only women but animals of both sexes are rigorously excluded. The first condition of admission to a monastic order is the approval of the superior, after which the candidates remain for a short time as postulants. After this preliminary trial, they enter on what is called the novitiate, the length of which in different orders varies from one to three years; and at its close they are admitted to the profession, at which the solemn vows are taken. The age for profession has varied at different times and in different orders; the Council of Trent, however, has fixed sixteen as the minimum age. Originally all monks were laymen; but after a time the superiors, and by degrees other more meritorious members, were admitted to holy orders. Amongst the mendicants, those in priest's orders were called 'father,' the lay brothers 'brother' only. In either case, where the order is one of those solemnly approved by the church, the engagement taken at the final profession is life-long and irrevocable.

The name monastery, in its most strict acceptation, is confided to the residences of monks, properly so called, or of nuns of the cognate orders (as the Benedictines). As a convenient term for the numbers of great classes, the Abbey and the Priory. The former name was given only to establishments of the highest rank, governed by an abbot, who was commonly assisted by a prior, sub-prior, and other minor functionaries (see Abbot). A Priory supersedes a less extensive and less numerous community. It was governed by a prior, and was originally, although by no means uniformly (at least in later times), subject to the jurisdiction of an abbey. The distinction of abbey and priory is not generally among the Benedictine nunns. In the military orders the name of Commandery and Preceptory corresponded with those of abbey and priory in the monastic orders. The establishments of the mendicant and, in general, of the modern orders are sometimes, though less properly, called monasteries. Their more characteristic appellation is Friary or Convent, and they are commonly distinguished from monasteries. The names of the superiors of such houses differ in the different orders. The common modern name is superior in some cases the superior is called Guardian (as in the Franciscan Order), Master, Abbé, or Guardian; in others Prior, Superior, Major, Father Superior, &c. The houses of females—except in the Benedictine or Cistercian orders—are called indifferently Convent and Nunnery; their head is styled Mother Superior or Reverend Mother. The monastic institute, from the earliest time, included women as well as men. The former were called in Greek by the name nonis or nonnai, and in Latin nonna (from which the English Nun), as also sanctonunnae. The general characteristics of the monastic institute for females are substantially blended, and the common attributes of the three is.

It was to be expected that the monastic foundations in England would not long survive the national rejection of the papal power which was their main support. The monasteries had mostly outlived their days of usefulness, and very inadequately fulfilled the objects of their former establishment, though not universal decay of religious fervour, and the revelation from time to time of grave scandals within their walls disposed many prudent men to regard them with little favour. But the immediate cause of their downfall was their accumulated wealth. The Guise, Cranmer, and other misdeeds of Henry VIII. The dissolution of monasteries was indeed no new idea, for Cardinal Wolsey several years before had obtained bulls from the pope enabling him to suppress certain religious houses and appropriate their funds for other purposes. Henry's proceedings were, however, as unworthy as they were inexpedient, and he appointed unprincipled agents to visit and report on the said establishments, and declare the same houses in the kingdom. These men performed their work in indelict haste, and upon obviously insufficient evidence brought against the monks generally charges of gross immorality which were almost always paralleled in the so-called Black Book of the time. The king at first acted with considerable care. He appealed to the selfishness of the greater abbots who had sent in the House of Lords, and silenced their opposition by declaring that in the larger monasteries 'religion was right well kept,' and proposed the confiscation only of the smaller houses (376 in number) with a revenue of less than £200 a year. This ensured the passing of the Act of Suppression in February 1536. But the turn of the 645 greater monasteries soon came. Certain abbots implicated in the rising of the 'Pilgrimage of Grace' were convicted of treason and their houses seized. Then followed another general visitation, and, by bribes, intimidation, and violence, the remaining monastic communities were one by one induced in 1539 to 'surrender' their property to the king. The revenue accruing to the crown by the establishment of schools, the sale of monastic lands, and the sale of this fund six new episcopal sees and certain collegiate churches and grammar-schools were founded, and a few castles built for the defence of the coast. But the greater part of the property fell through purchase or gift into the hands of the nobility and gentry; and the policy which thus interested powerful laymen in maintaining the new order of things effectually barred the way to the restoration of monasticism in the reformation reign of Mary. Fresh light has been thrown upon this whole subject by Canon Dixon in his recent History of the Church of England, and again more fully by Father Gasquet, O.S.B., in Henry VIII. and the English Monasteries (2 vols. 1889; 4th ed. 1890).

In some of the German states the temporalities of the suppressed monasteries were retained at the Reformations, and were granted at pleasure by the sovereign for the benefit of the state or its distinguished subjects to the detriment of their religious order, or to individuals in their capacity of monks or nuns. In England there was the religious community of Little Gidding (1625-47), founded by Nicholas Ferrar (q.v.); the Jesuit College, founded in 1610, at St. Omer; and the Catholic College of Cowley Fathers, was established at Oxford; but here, too, Sisterhoods (q.v.) are far more numerous. In all these Protestant revolutions of monachism, the engagement is revocable at the will of the individual. At the French Revolution the monastic establishments of France were utterly suppressed; and in most of the other Catholic countries of Europe the example has been followed to a greater or less extent. After the Restoration a revival of many of the orders took place in France. In 1835 Spain suppressed all religious orders, except the rest of the world, Portugal dissolved all its religious houses in 1834. In Belgium, Austria, and Switzerland, monasteries are numerous—in Belgium there are 290 communities, in Austria (without Hungary) 450, in Switzerland 88. In Italy, Sardinia put an end to the religious orders of their kingdom at the beginning of the century, the superiors in the rest of the kingdom; and in the year 1818 the constitution of the union was extended to the whole kingdom after 1870, the orders being expropriated, and their houses made national property; in all upwards of 2200 houses were suppressed. In 1873 Russia dissolved all orders save those devoted to sick-nursing (at that time in Russia there were 2006 establishments with 16,846 nuns), but in 1887 readmitted all these orders engaged in pastoral duty, Christian charity, or the contemplative life. The French decree of 1850,
to the family of Grimaldi. Originally of Genoese extraction, they first held lands in France, between Fréjus and Toulon, where the name of the bay of Grimaldi still commemorates their sway. They acquired Monaco in 1984, Mentone and Roquebrune about 1810, and Antibes in 1237. In European politics they sided with the Guelph party. Honoré II., put his country under a French protectorate in 1644. In 1715 the heiress of the Grimaldi of Monaco married Matignon, Comte de Thorigny, and her descendants continued to reign over a small kingdom. It has, however, suffered at the hands of its great neighbours. In 1846 Mentone and Roquebrune were annexed by Sardinia, and after the war of 1859 the whole territory belonged for a short time to King Victor Emmanuel. The protests of its lawful owners were, but he was none the less ready for another arrangement, since in 1861 he sold Mentone and Roquebrune to Napoleon III. for 4,000,000 francs. His capital is now under French protection. Prince Albert (born in 1848, succeeded 1889), the present sovereign, has no son, and the house was dissolved in 1889, with Lady Mary Hamilton. About 1000 of the inhabitants are employed in the rooms and gardens of the celebrated Casino. These gambling-rooms, built at Monte Carlo on ground leased (1914) from the French government to a joint-stock company or Société Anonyme, which pays 50,000 a year for the concession, and sets aside about 360,000 a year for working expenses. Some 200,000 is paid to the army of croupiers, police, detectives, theatrical and operatic companies. Large sums go for the upkeep of the gardens and houses and management generally; and the company is held bound to defray the municipal expenditure as well. In 1895 the clear profit was said to be 13,000,000 francs: it is quite usual to pay 9 or 10 per cent. on the present value of the shares, and 30 or 40 per cent. on their original value. In 1895 1,160,000 francs were paid for 'publicity'-i.e. as hush-money, to many newspapers (chiefly Parisian) to suppress hostile criticisms, unpleasant facts, suicides, &c. The climate of Monaco is milder than that of any other place in the Riviera; palms and aloes grow more luxuriantly, and rare wild-flowers are found on its rocky promontory.

See Mévix, Monaco et ses Princes (2d ed. 1863); Pemberton, Monaco Post and Present (1877); and Boyer de Sainte-Suzanne, La Principauté de Monaco (1881).

Monaco.

Monte Carlo.

The territory, which is encircled by the French department of Alpes Maritimes and the sea, consists mainly of the rocky promontory on which the capital is built, and a small strip of coast. For more than nine hundred years it has belonged

by whom (with some alterations of recent construction) it was held till the reign of Louis XIV., when it was erected into a shire. The county possesses two round towers, one, very complete, at Clones, the other at Inniskeen; and there are several roads and Danish forts. The name Monaghan is derived from

Monaghan.

6218 in Condamine, and 3794 in Monte Carlo. The county, which is situated between Tyrone and Meath, has 319,741 acres (496 sq. m.), of which 140,000 are under tillage. Pop. (1881) 200,492; (1891) 202,749; (1901) 206,806 (of whom 73 per cent. were Catholic). The principal towns are Monaghan, Carrickmacross, Clones, and Castle-Blamey. It returns two members to Parliament. Monaghan, granted by Henry II. to De Courcy, speedily fell back into the hands of the native chiefs of the sept MacMahon, but in 1567, when the powers of the Gaelic nobles were broken, it was held till the reign of James I., when it was erected into a shire. The county possesses two round towers, one, very complete, at Clones, the other at Inniskeen; and there are several roads and Danish forts. The name Monaghan is derived from

Monaghan.
the Irish Monachan, 'Monkstown,' a monastery having stood here at a very early date.

Monaghan, the county town, is 76 miles NNW. of Dublin by rail. The town, which returned two members to the Irish parliament, is still the centre of some trade in agricultural produce, and can boast several public buildings of considerable pretensions, among which are the Catholic college and church, the infirmary, and national model school. Pop. (1861) 3010; (1891) 2955. See Evelyn P. Shirley's History of the County of Monaghan (1877-80).

Monaldi. See Christina.

Monarchy (Gr. monarchia, from monos, 'alone,' and arkhé, 'I govern,' literally, the government of a single individual) is that form of government in a community by which one person exercises the sovereign authority; see Government. For Monarchianism, see Unitarians.

Monastery, a class of structures which arose in the middle ages to meet the requirements of the large number of monks that had existed. It is proved by documents that these buildings were at first constructed somewhat after the plan of a Roman house, or rather of a Roman villa or country-house. Records of abbeys as early as the 7th century show that the arrangements were similar then to those of the 12th century. The cloister, plan cannot be obtained. The annexed plan is a model one made by Mr E. Shrapne, and contains the results of his careful investigations of the Cistercian monasteries throughout Europe (see Trans. Roy. Inst. of British Architects, 1871). In northern climates the cloister was usually situated on the south side of the church, for the sake of the sunshine and warmth. It was composed of an open courtyard, square or oblong in area, surrounded by an open arcade, or covered way. The church formed the north side, and on the east side was situated the chapter-house, with the monks' dormitory over it. The latter was thus in immediate communication with the church, and conveniently placed for the monks' attendance at the services during the night. The chapter-house in the Cistercian monasteries was usually divided into three compartments by the pillars bearing the arches. The abbot's seat was opposite the entrance door, and a stone seat all round accommodated the monks. The doorway was not always closed, and together with an open arch or window on each side of it allowed those in the cloister to hear the discussions in the interior. The sacristy is placed on the north side of the chapter-house, with a door from the church. A single cell or 'palás' occupies the south side; then comes passage or 'slype' leading from the cloister to the gardens, &c. Beyond this is the frater or day-room of the monks, a long vaulted apartment running southwards, having a row of columns in the centre and open windows.

The south side of the cloister generally gave access to the refectory, a large, rather ornamental chamber, usually with an open wooden roof. It was sometimes placed parallel and sometimes at right angles to the cloister. Opposite the door to the refectory and in a vaulted recess was a fountain or basin where the monks might wash. Adjoining the refectory were the kitchen and offices. The former was frequently a detached building with a large number of hearths, each having a separate chimney in the roof.

Along the west side of the cloister, and sometimes extending much farther, lay the hospitium or guest-house, where all travellers were received, and the lay-room above, where they were lodged. A very important room in the monastery was the scriptorium or library, in which the MSS. were written and illuminated; this was on the second floor of the chapter-house. The abbot's lodge formed a separate edifice, as also did the infirmary. The whole establishment was surrounded by a wall, and provided with proper gates and defences. The outer gate gave access to the outer court, in which were situated the workshops of the various tradesmen connected with the abbey, and the buildings required in connection with the agricultural employments of the lay brethren.

Such were the arrangements of the Cistercian

MONEY into France, to the the returned has as business I"e money, 8765. 1470). l>no, England, was Edinburgh, by case,vation, of work, now was learned, Violet le Duc, Dictionnaire and Architecture Monastique; De Camou, Abbeceaire d'Archologie; Dugdale, Monasticon; and Mackenzie Walcott's works on the English and Scottish Churches. For Monasticism, see Monacism.

Monastir, called also Bifolla, the second town in Turkish Macedonia, is situated in a broad mountain-valley, 90 miles NW. of Salonica. It manufactures carpets and silver filigree, and trades in corn and agricultural products. The Turks, re- cognized its importance, made it the headquarters of an army corps. Under its ancient name of Pelagonia it gives title to a Greek archbishop. Here the Albanian boys were massacred in 1833. Pop. 45,000.

Monboddo, James Burnett, Lord, Scottish lawyer and author, was born at Monboddo House, in Fardouine, Scotland, 30 May 1714, was educated at Marischal College, Aberdeen, and Edinburgh University, afterwards studying law for three years at Gruningen, in Holland. In 1737 he was called to the Scottish bar, and soon obtained considerable practice; but the first thing that brought him prominently into notice was his connection with the celebrated Douglas case, in which he acted as counsel for Mr Douglas. In 1764 he became sheriff of Kin- cardineshire, and in 1767 was raised to the bench by the title of Lord Monboddo. He died in Edinburgh, 26 November 1799. Monboddo's Origin and Progress of Language (6 vols. 1773-92) is a very learned, heretical, and eccentric production; yet in the midst of its grotesque crotchets there occasionally flashes out a wonderfully acute observation, that makes one regret the distorted and misapplied talent of the author. Its evolution theory and its assertion of a close relation between man and the orang-outang seems less laughable now than it did to Monboddo's contemporaries; and in his study of man as one of the animals, and of civilisation by the light of savagery, he certainly anticipated the modern science of anthropology. Monboddo published, also anonymously, another work, Ancient Metaphysics (6 vols. 1779-90).

Mombuutu, a Negro stock in the basin of the Upper Nile and the Upper Welle. See AFRICA.

Moncalieri, a town of Italy, on the Po, 5 miles S. of Turin, with a royal palace (1470). Pop. 3403.

Moncontour, a village in the French department of Vienne, situated 48 miles SW. of Tours, was the scene of the defeat of the Hugenots under Coligny by the troops of the king of France, 3d October 1569.

Moncrieff Plis (named after the inventor, Sir Andrew Moncrieffe) are experimental, in which heavy guns are placed in coast batteries or other places where it is specially necessary to protect them from hostile artillery fire. The Moncrieff system of mounting utilizes the force of recoil to bring the gun down into the loading position at the bottom of the pit. It is returned into the firing position (shown in the figure) either, as in the early patterns, by means of a heavy counter-weight in front of the breast of the gun-carriage, or, as in the latest designs, by hydro-pneumatic machinery. When the counter-weight is used, the side brackets of the carriage on which the disappearing movement takes place are made on a specially designed curve, so that this movement may be regular and without any violent shock. The figure represents a diagrammatic section of this arrangement. A is the rotating side bracket revolving on teeth; BC are two inclined planes keeping the gun horizontal as it descends into the position shown by dotted lines. The same result is obtained in the hydro-pneumatic system of mounting by means of recoil pressure, which also store up the force of the recoil and enable it to be used to elevate the gun into the firing section. The invention belongs to the years 1868-72.

Moncton, a town and part of entry of New Brunswick, on the Petitcodiac River, 80 miles by rail NE. of St John. It has important railway-stations, a large sugar-refinery, a cotton-factory, &c. Pop. (1881) 5032; (1891) 8765.

Moncrieffe, a cathedral city of Italy, 58 miles S. of Turin by rail. Pop. 10,302. Here, on 22d April 1736, the Sardinians were totally defeated by Napoleon.

Monette, a class of Protozoa (q.v.) proposed by Haeckel to include the very lowest organisms supposed to be destitute of a nucleus. As this structure has been shown to exist in forms where it was formerly denied, the title is now being abandoned. See PROTOZOA.

Money. The term money is used, both in matters of business and in economic theories, in such very different ways that it is impossible to cover them all with a simple definition. Standard coins, bars of bullion which can at once be converted into standard coins, token coins, convertible bank-notes, inconvertible notes, are all included under 'money,' although they present essential differences. In modern societies one of the most important forms of money is 'bank money,' or the money of the money-market, which for the most part consists of neither coin nor notes. The whole of the banking system of the United Kingdom, for example, as well explained in Bagehot's Lombard Street, really rests upon the reserve kept by the Bank of England, and every bank receives deposits of 'money,' and makes advances of 'money,' with the use of a very small proportion of coins or bank-notes. A brief survey of the development of the complex monetary system of modern societies from its rudimentary forms will give the best explanation of this uncertainty in the meaning of this familiar word, and also bring out in the clearest way the principal functions of 'money.' Exchanges first take place by means of barter, but the difficulties of simple barter are obviously very
MONEY

great. A coincidence of mutual wants at the same
time and place is the first condition of any ex-
change, and it is plain that a common medium of
exchange will obviate one of the principal difficul-
ties of direct barter. If there is some one thing
which every one is willing to take, it follows that
all other things have been used as 'money,' and
against the particular commodity. Accordingly the first func-
tion of 'money' is to provide (1) a medium of
exchange, and its first forms consist of things
which are generally desired in simple states of
society. Skins, cattle, shells, corn, pieces of cloth,
and other things have been used at different times and
places as 'money,' in the sense of a common medium of
exchange. The commodity chosen, however, will be of little
advantage unless it can be used both in large and
small quantities. This consideration leads to
another primary function of money—viz. (2) as
a measure of value. Not only is it necessary that
things can be exchanged against a common sub-
stance, but the rates of exchange must be measured.
Finally, as society advances, a basis for (3) deferred
payments, and also a method of (4) storing 'values'
with a view to future consumption. In order
that these four primary functions may be
fulfilled, the substance chosen for money
must have certain properties, of which the principal are
portability or great value in small bulk, durability,
sameness of quality, divisibility, stability of value,
and cognisability. It was soon discovered that
these qualities are possessed in the highest degree
by gold and silver. Other metals have been used
at different times even for standard money, but all of
them fall in one or more of these particulars.
Iron is liable to rust, lead is too soft, tin too brittle,
and copper too heavy. It may be observed that
the importance of the qualities varies according to
circumstances. Thus, when, as in modern societies,
the greater part of wholesale transactions are
affected without the intervention of material
money, portability is of comparatively small
importance, whilst on the other hand stability of
value is of the greatest importance in all kinds of
deferred payments. It is not necessary that all
the primary functions of money should be fulfilled by
the same thing. In Saxon times, for example, and for long after
in England the standard measure of value was the
sceatta, a piece of silver. In fact, no such thing as an
actual medium of exchange consisted of silver
pennies. At present the actual medium of
exchange consists to a great extent of bits of paper—
bank-notes, cheques, and various instruments of
credit—whilst the standard measure of value is a
piece of gold.

So long as the attention is directed to material
money, the principal questions that arise are
in connection with coinage. At first, after the
introduction of the precious metals, it was left to
the parties concerned to test gold against this
figure, with confidence for the result, and the
present unsatisfactory state of the English gold
coinage is mainly due to the survival in law of the
presumption that it is the duty of the receiver of
money to see that it is of full value. But the
existence of such a presumption is clearly an
abuse, and authority should add its stamp to small ingots of
metal, in such a way as to signify their weight and
purity. Simple and important as this duty appears,
history is full of examples of the debasement and
deterioration of coins by governments with the
view to raising revenue. It is not necessary, however, that from the earliest times (with
the exception of the reign of Henry VIII.) the English
silver was kept of the same fineness. It is true
that the weight of the coins became gradually less,
but it was probably in most cases the recognition of
an accomplished fact (through ordinary wear
and tear), and was not an attempt to defraud.
The evils which arise from the natural or artificial
debasement of coins have been well described by
Macaulay in his account of the coinage in the reign
of William III. Since the primary object of coinage was simply to furnish a mark of weight and
fineness, it does not matter that the coins do not
agree with what it professed to be. Thus, the old English
silver pound was coined into 240 pennies; and this
fact is preserved in the Troy table—20 penny
weights = 1 oz., 12 oz. = 1 pound. In process of
time the actual weight of the penny became less
than the Troy weight of it. This was not supposed to
still be supposed to go to the pound. Finally, a
certain amount of gold of a certain fineness was declared
to be equal in value to a 'pound of silver,' or rather to
240 pennies. This is historically the answer to Sir
Robert Peel's famous question, 'What is a pound?' The technical answer to the
question is now given by the Coinage Act of 1870
(in substance the same as that of 1816). The act
declares the precise weight of the sovereign in
grains, and the proportion of alloy in standard
coin. Namely, any one can take standard gold
of the money, and it is the receipt of gold
or silver sovereigns free of charge; 20 pounds-weight
Troy being coined into 934 sovereigns and one half
sovereign. Practically the time and trouble in-
volved in going direct to the mint induced people
to sell their gold in preference to the Bank of
England, and at first (within certain narrow limits) the price varied.
Now the bank is com-
pelled to purchase all standard gold at £3, 17s. 9d.
per oz., and, as it obtains from the mint £3, 17s.
10½d., there is a small profit by way of brokerage.
Allowing for this small difference, it will be seen
that the present standard is held, and that the
word 'standard' simply refers to the number of standard coins made
out of a certain amount of standard metal. It
follows that this mint price is fixed and invariable
so long as the law remains unchanged. Thus, if
gold became as plentiful as blackberries, or as
scarce as diamonds, the mint price would remain
unaltered. At the same time, however, the value
of gold in the sense of its purchasing power over
commodities would change according to the varia-
tions in the quantity, though the precise nature
and extent of the change would depend upon other
circumstances. It will be seen that the charge for coinage—this
charge is called seigniorage. So long as this
charge is paid, however, there is no restriction on the
quantity of metal which may be converted into
full standard coin. It

is necessary now to notice the distinction
between standard money, in the proper usage
of the term, and token money. The chief charac-
teristics of the former are that, as just explained,
it is coined to an unlimited extent, and further,
that for any money contracts it is unlimited
legal tender. In 'token' money these two charac-
teristics are absent. The nature and uses of token
money are also best explained historically. In
England, mild inflation of the currency in times
when prices were extremely low. The silver penny was
originally about the size of the present threepenny
piece; for the low range of prices then current it was inconveniently large and val-
uable. In a petition of the date of 1330 it
was to the king that 'nothing is more galling,' and that a penny is the smallest coin,
and the petitioners pray that smaller coins may
be struck to pay for their little purchases, and 'for
works of charity.' The great practical difficulty,
however, was to make very small coins of full
standard value. So much was the need of small
MONGOLS

change felt, however, that by the time of Elizabella the people had resorted largely to 'tokens' of lead, tin, and even copper coins. These 'tokens' were used at first private issues, and practically were like very small promissory-notes. It was soon found that they were forced into circulation by unfair means, and then the issuers refused to change them for gold or sterling money. The remedy adopted in 1613 was to give a monopoly of striking copper or brass farthings to certain persons for a consideration. This privilege, however, was so much abused, that in many parts of the country, including London, there was hardly any gold or silver coins in circulation being used for business. The patentees tried to force these farthings on the American colonies, but it is recorded of Massachusetts—March 4, 1634, at the General Court at New Town, brass farthings were forbidden, and bullets were made to pass for farthings. These 'royal tokens' were so numerous, owing to the abuses which they had caused, that they were again replaced by private tokens, and it is said that over 20,000 different kinds were in use between 1648 and 1672. Evelyn, in his Diary speaks of the tokens issued by every tavern and public house through the neighbourhood, though seldom reaching farther than the next street or two.

From this slight historical sketch the principles which should regulate the issues of 'token' money stand out clearly. The smallest coins cannot be made of precious metals as a silver farthing would be less than one-tenth of the present threepenny-piece—and, accordingly, base material must be used. Here, however, the danger arises of going to the other extreme and making the tokens too large. This is only a comparative difficulty compared with the necessary condition that the token coins must bear a fixed relation to the standard coins in value. Thus we arrive at the fundamental principles of 'token' coins; they should be issued in limited quantities, be legal tender to a limited extent, and their so-called intrinsic value should be less than the nominal value. Even those nations which use both gold and silver as standard money (see Bimetallism) are compelled to use token coins for small values, whilst nations which have a gold standard restrict their silver coins to the same extent.

With the progress of civilisation 'representative' money, as it has happily been styled by Jerovon, became of more and more importance. The Romans, for example, had a highly-developed banking system, which, however, was broken up on the disruption of the empire. In the early medieval period bills of exchange were used for foreign payments; and that they were considered as 'representative money' is shown by the fact that in England, up to the Tudor period, their value was regulated by the Royal Exchanger, a high official connected with the mint. The development of banking in the modern sense was very slow. The earliest banks in Italy were finance companies which provided governments with loans, but the great banks of the north of Europe were expressly developed to provide good money to meet the payment of bills of exchange (see Adolph's account of the origin of the Bank of Amsterdam, Wealth of Nations, book iv.). The money in the great trading centres was drawn from various countries, and was in general debased and worn. The banks took this bad money from the merchants and gave them good bank money in return. The merchants, however, allowed the money to remain in the bank, and handed one another transfers. It was soon discovered that a small amount of actual coin was sufficient to meet all liabilities, and, accordingly, the remainder was lent. In this manner 'bank money' has in process of time come to consist of a large mass of representative money supported on a metallic basis. See Banking.

Money-lending. See Usury.

Money-wort, a name given to various plants—Dioscorea, Lyrinonee, Thyamus, &c.

Monger, a French mathematician and physicist, was born of humble parentage at Beauue, in the department of Côte d'Or, 16th May 1746. When only fifteen, he went to study natural philosophy at the Observatoire. By 1762, he had afterwards obtained admission into the famous artillery school at Mézières, where he invented the method known as 'Descriptive Geometry.' In 1780 he was chosen a member of the French Academy, and was called to the Paris Lyceum as professor of Hydrodynamics. During the last years of the Revolution he became minister of Marine, but soon took charge of the great manufactories for supplying republican France with arms and gunpowder. After he had founded the Ecole Polytechnique, he was sent by the Directory to Italy. Here he formed a close friendship with Bonaparte, and, following him to Egypt, undertook the management of the newly-founded Egyptian Institute. On his return to France, he resumed his functions as professor in the Ecole Polytechnique, and, though his reverence for Napoleon continued unaltered, he hotly opposed his aristocratic and dynastic views. The title of Count of Pelusium was conferred on him by Napoleon. He died 28th July 1818. His principal works were Traité Élémentaire de Statique (1788), Leçons de Géométrie descriptive (1795), and L'Application de l'Analyse à la Géométrie (1795).

Monghyr, a picturesque city of Bengal in India, on the right bank of the Ganges, 80 miles E. by S. of Patna, consists of the fort, a rocky crag projecting into the river, and the native quarters. From the 12th century onwards it was a place of considerable strength; in the 18th century Mir Kasim made it his headquarters. He established an arsenal, and its armours are still famed. Pop. (1891) 57,077.—The district has an area of 3921 sq. m., with a pop. (1891) of 2,036,021.

Mongols, an Asiatic people belonging to the Ural-Altaic branch of the human family, derive their name from a word mong, which means 'brave,' 'bold.' Their origin and early history are lost in a dim antiquity. Chinese annals first speak of them as dwelling, 6th to 9th century, in what is now Mongolia north of the desert of Gobi, and in the regions south of Lake Baikal. The origin of the royal house is enshrined in myths, the maternal ancestor being by tradition a she-wolf; probably the house was descended from a ruling family of the Turks (Hung-n). The cradle of the Mongols seems to have been the region between the river Onon, the Orkhon, and the Kerulen, the latter a tributary of the Argun. It was in that region that Genghis Khan was born, and in that region that he fixed his permanent camp or capital, at a place called Karakorum. An ancestor of the great conqueror ruled in the middle of the 12th
century over a confederation of Mongol tribes powerful enough to be a serious menace to the
Kin empire of North China; and at the same time he was able to carry on a bitter contest against the
Tartars. That the confederation was loose—probably the only tie was the compelling will of the
energetic chief—the is indicated by the tenacious
(i.e. Genghis Khan’s) early vagaries. It was
only by dint of hard fighting and tenacious persist-
ence that he was able to maintain undiminished
the power possessed by his father, and his father’s
father before him. But the conqueror’s genius was in
him, and he died succeeded by his son Chingis Khan.

Towards the end of the 13th century, Batu and
Orda, the sons of the eldest son (Juchi), were
invited with Khwarezm, the region watered by the
rivers Ural, Oxus, and Jaxartes; Jagatai, the
second son, received the territories between Bokhara,
the Irtish, and the Ishi; the region between the
Irtish and Lake Baikal was assigned to Ogotta;
and to the youngest son, Tuli, was given the home
country south of the Baikal. But as a check to
Ogotta’s overconfidence, in conjunction with his
brother Tuli, the conquest of North China. The
capital of the Kin was taken in 1234, and, the last
emperor of the dynasty having hanged himself, the
Mongol ruler became emperor in his stead. North
China had been thus subdued, Ogotta proceeded
to conquer Chaghatay south of the Yellow River, then
governed by the Sung dynasty, and to reduce
Corea. Meanwhile another army, commanded by
Batu, attacked and subdued the principalties of
which is now Russia—Bulgaria on the Volga,
Ruskin, Moscovy, Volhynia, etc. They divided
the division of land amongst the sons of the
Mongol ruler, the conqueror of China.

The term Mongol is used by ethnologists to
describe the group of cognate languages which
colonize one division of the Turanian (q.v.) family
of speech. What Mongol literature there is consists
for the most part of translations of religious
works from Tibetan and Chinese, historical works
(namely the chronicles of Suanang Setsen in the
middle of the 17th century), of folk and fairy tales,
and a few poetic productions. Perhaps the
best known or translated is the very successful
of the 18th century
Siddhi-K’ur (ed. Jüel, 1863). Others have been
published by him (1866-69), by Bergmann (1864-65),
I. J. Schmidt (1890), and Russian savants.

Mongoose. See Ichneumon.

Monica. See Augustine.

Monier-Williams. See Williams.

Monsun, a philosophical theory that all being
may ultimately be referred to one category. Thus
idealism, materialism, nominalism are nomisms, as
supposed to the Dualism (q.v.) of matter and
spirit. See PHILOSOPHY.

Moniteur. Le, a French journal, started by
the publisher Pankeconce, 5th May 1789, under
the title of the Gazette Nationale, on le Moniteur
Universel. During the Revolution its reports,
were of very great importance, and its value
importing to the public the increased weight
which made the official organ of the government.
It retained the privilege (without the first title,
Gazette Nationale, which was dropped in 1811) down
to 1869, when it was supplanted by the Journal
Officiel. Afterwards it was issued as an Oriental
or private Conservative paper.

of the Golden Horde; but his power was crushed
by the greater Tamerlane (q.v.). In 1519 Baber
(q.v.), a descendant of Genghis Khan’s son Jagatai, founded
the Mogul empire in India. The Kalmucks (q.v.) also belong
to the western branch of the Mongol.

The total number of Mongols now under Chinese
rule is estimated at two millions. They live in the
most part in the immense plateau of central
Asia called Mongolia (area, 1,288,000 sq. m.),
which is gridded on all sides by lofty moun-
tain-chains (Altai, Thian-Shan, Chingam, etc.).

Its southern portion consists of the vast desert of
Gobi. These people are addicted to horse
riding, and in their historic ancestors before them always were.
They live in tents in flocks of sheep, herds of horses
(smaller, but very enduring), cattle, camels, and goats.
They are mostly Buddhists, though those in the
west are in part followers of Shamanism, as all
Mongols were before the days of the great
conqueror. As a rule they are hospitable, though
indifferent to personal comfort, addicted to cattle-
stealing and to drink, but when sober good-hearted
and friendly; on the whole, life being easy and
their wants few and simple, they display a lack of
foresight, ambition, and military spirit. Their
renowned army, which are their only protection against the
violent sandstorms of summer and the still more
terrible snow-hurricanes of winter. They are
fond of making religious pilgrimages to Urga (q.v.),
the religious capital of the country, and to various
other shrines in China and Mongolia. Kalmyks and
Kineita are the principal commercial centres.
It is difficult to estimate the numbers of the western
Mongols, as they have in many parts commingled
with their Turkic neighbours; but see such articles as
Kipchaks, Kirghiz, Russia, Siberia, Tartars,
Turkestan, etc. The Buriats (q.v.) are almost entirely
subject to Russia, they are a branch of the
Mongol race.

Mongols. See Mongol.

Mongolia. See Monchuria.

Monks. See Augustine.
Monitor, a name given to a genus of Lizards somewhat isolated from other lizards in structural characters; in some respects they approach the Crocodilia, which are the highest of existing reptiles. They are the largest of existing lizards; a specimen acquired by the College of Surgeons in London measured 6 feet 10 inches. The tail of the greater number is laterally compressed, the better to adapt them to aquatic habits. They have received the name Monitor from a notion that they give warning by a hissing sound of the approach of a crocodile or alligator. There is only one genus, with many species.—The Monitor or Varan of the Nile

**Monitor (Varanus niloticus).**

(*Varanus niloticus*) is of a rather slender form, and has a long tail. It is olive-gray, mottled with black. It attains a length of five or six feet. Crocodiles' eggs or young crocodiles form the chief part of its food. It is a curious superstition in India, that the young of the monitor is more deadly than the most venomous serpent.

**Monitor.** See NAVY.

**Monitorial System, or Mutual Instruction.** It first occurred to Dr Andrew Bell (q.v.), when superintendent of the Orphan Hospital, Madras, in 1795, to make use of the more advanced boys in the school to instruct the younger pupils. These youthful teachers were called Monitors. The method was eagerly adopted by Joseph Lancaster, who in the first years of the 19th century did so much for the extension of popular education; and, from him and the originator, the system was called indifferently the Monitorial and the Lancasterian, as well as the Monitorial or Mutual System. See EDUCATION, Vol. IV. p. 210. The monitorial system is not, as is commonly supposed, a method of teaching; it is simply a method of organising schools, and of providing the necessary teaching power. At a time when the whole question of primary education was in its infancy, the state refusing to promote it on the ground that it was dangerous to society, and the public little disposed to contribute towards its extension, it was of great importance that a system should be adopted which recommended itself as at once effectual and economical. But its value as an educational agency was universally overrated, and in the end broke down.

**Monk.** See MONACHISM.

**Monk, George,** Duke of Albermarle, soldier of fortune and restorer of the English monarchy, was the second son of Sir Thomas Monk of Potheridge, near Torrington, North Devon, and was born either there or at Lunnonus on 8th December 1608. He saw service first in the expeditions to Cadiz and Rochelle (1625-27), and then for nine years in Holland, returning to England in 1630, in time to take part in the two Bishops' Wars with the Scots. In 1642-43 he commanded a regiment against the Irish rebels, in 1644 was taken prisoner at Nantwich by Fairfax. He lay two years in the Tower, where he solaced himself with frail, ugly Nan Ratsford or Clarges (his future duchess), and whence he freed himself by taking the Covenant—Clarendon hints that he did so for no better reason. He was at first so commended himself to Cromwell, still more by his brilliant conduct at Dunbar (1650), that next year he was left to complete the subjection of Scotland. In 1653 he was associated with Blake and Deane in naval operations against the Dutch, and won two light sea-fights. He was in 1654 Cromwell sent him back to Scotland as governor, in which difficult office he acquitted himself with vigour, moderation, and equity. Even the Highlanders were reduced to order. His home for five years was Dalkeith, where he was ever engaged in business or in planting, which he loved as an amusement and occupation. After Cromwell's death, seeing everything in confusion, and a splendid chance open to him who dared seize it, on New-year's Day 1660 he crossed the Border with 6000 men, and, with much success, was soon opposed. So far he had kept his intentions profoundly secret. Still every one felt that the decision lay with 'Old George;' every party courted him; the Republicans even offered him the protectorate. But, while he offended nobody, he declined to commit himself. The result of the war was to test patiently the course of events. From the first, his own wish, dictated by no high motive, had been to bring back the Stuarts; and before long he saw that the nation at large was with him. The freeing of the lump parliament from the army, the readmission of the excluded members, and the election of a new parliament—these were his wily steps towards the Restoration; on 23d May he welcomed Charles II. on the beach at Dover. Monk now was made Duke of Albermarle, and entrusted with the highest offices in the state. But he soon retired from political affairs. In 1665, when the plague ravaged London, and every one fled that could, as governor of the City he stuck bravely to his post, and did his best to allay the panic and confusion. Next year he was employed as second in command of the fleet sent to reduce New York against the Dutch, and was defeated by De Ruyter in a sea-fight off Dunkirk, but soon after gained a bloody victory over him off the North Foreland. He died, sitting in his chair, at Newhall, his Essex seat, on 3d January 1670, and was buried in Westminster Abbey. 'A man,' says Guizot, 'capable of great things, though possessing no greatness of soul.'

See, besides works cited at CHARLES L, CROMWELL, and CHARLES II., the Lives of Monk by Gumble, his chaplain (1671), Skinner (1729), Guizot (Eng. trans. 1853), and Corbet (1888), the best a biography.

**Monkey.** This term may be conveniently restricted to all the Primates exclusive of the Anthropoid Apes (q.v.). It has been sometimes applied to the tailed forms only, the rest being spoken of as Ape. Among the anthropoids, the tars and ape is ill-judged, inasmuch as it implies that the non-anthropoid Primates are divisible into tailed and tailless species. The real distinction is not to be found in this character. The quadrumanous as a whole are divisible into three chief groups: (1) Anthropoid Apes; (2) Platyrhini, the New-World monkeys; (3) Catarrhini, the
Old-World monkeys. It is the two latter divisions that are dealt with in the present article.

In the Platyrrhini the nostrils are far apart; the tail is prehensile, and the number of premolar teeth is in excess of that of the Catarrhini, the dental formula being (for the molars and premolars) p.m. \(2,1,3,3\). In the marmosets the formula is p.m. \(3,3\); this, coupled with some other peculiarities in their anatomy, led the institution of a distinct group—Aegyptopithecini, regarded as equivalent to either the Platyrrhini or Catarrhini. They are now, however, more usually referred to the Platyrrhini, though placed in a separate family.

In the Old-World monkeys, or Catarrhini, the nostrils are near together; the number of teeth 32, and these arranged as in the anthropoid apes and man; the molars and premolars being p.m. \(4,3,4,3\)—the reverse of the condition seen in the Marmosets. The tail, when present, is never prehensile; and there are three or four localities where calluses developed, which structures are entirely unknown among the American monkeys.

The two divisions of the monkey tribe based upon those characters are absolutely distinct in their geographical distribution. The Platyrrhini are only found in America, the Catarrhini are limited to the Old World; farther than this, the fossil species, which have not been found in strata earlier than the Miocene period, show the same rigid correspondence between structure and distribution. No Platyrrhine has been met with in the Old World, and no Catarrhine in the New. Whether this indicates that the monkeys of the two hemispheres have had an independent origin or not, is a matter for further inquiry; it must indicate in any case the remoteness of the period during which there was a possible land connection between Asia and America.

In both the Old and New Worlds monkeys are almost confined to the more tropical districts; and yet this is not entirely due to an incaucacity for hearing a rigorous climate, for monkeys occur high up on the sides of mountains in India. Monkeys do not occur in the tropical parts of Australia. During the Miocene and Pliocene periods these animals inhabited Europe and even England, for the remains of a Macaque have been described from the county of Essex. At present the only trace left in Europe of these inhabitants is the Macaca sylvanus or Barbary Ape, which occurs on the Rock of Gibraltar as well as on the opposite coast of Africa. But this animal is perhaps not truly indigenous; it may have been introduced.

In the New World monkeys are most abundant in South America. The forests of the Amazon and the Orinoco may be regarded as their headquarters. There are only ten species which occur north of the Isthmus of Panama, and only one of these extends as far as Mexico; this is a Spider Monkey.

The West Indian islands contain no indigenous monkeys. The American monkeys are all arboreal; and this fact limits their range to forested districts. The prehensile tail is a fragment of a more ancient relation to their mode of life. But it is a most singular fact that the long-tailed monkeys of the Old World, which might often gain considerable advantage from being able to use their tail as a grasping organ, are not prehensile.

Some of the more remarkable kinds of monkeys are noticed in separate articles (Rhinolophus, Barbary Ape, Entellus, Howler, Marmoset, &c.).

Monk-fish, another name for the Angel-fish (q.v.), was also applied in the 16th century to a large specimen of the Loike or Squid family.

Monk's-hood. See Aconite.

Monk's-Rhamb. See Dock.

Monmouth, the county town of Monmouthshire, stands, girl by wooded hills, at the influx of the Monnow to the Wye, 10 miles N. of Chepstow, in S. of Hereford, and 26 WSW. of Gloucester. Its chief features are the red-brick castle of John of Gaunt, in which Henry V. was born; the parish church, dating from the 14th century, and restored in 1882 by Street at a cost of £7,000, with a spireless 200 feet high; the bridge over the Monnow (1272), with its "Welsh gate," and near it a small Roman chapel; and the ruined diocesan priory, with "Geoffrey of Monmouth's study;" the new town-hall, built in 1888 at a cost of £10,000; and a grammar-school (1614). In the neighbourhood are the temple-crowned Kynim (800 feet), commanding a glorious view; the Backstone, a rock-stone, displaced by tourists in 1888, but since re-possessed; and, 7 miles SW., the superb ruins of Raglan Castle, defended for ten weeks in 1646 against Fairfax by the old Marquis of Warrister. First chartered by Edward VI., Monmouth unites with Newington and Usk to return a member. Pop. (1831) 5710; (1881) 6112; (1891) 5470. See Chartes of Monmouth (1820), and works by Heath (1894) and Greene (1879).

Monmouth, capital of Warren county, Illinois, is 179 miles by rail WSW. of Chicago. It is the seat of Monmouth College (United Presbyterian, 1850), with about 400 students, and manufactures agricultural implements, sewer pipes, and cigars. Pop. (1880) 7469.

Monmouth. JAMES, DUKE OF, was born at Rotterdam, 9th April 1649, the son of 'brownie, beautiful, bold, but insipid' Lucy Walters (1630-83), by Charles II., she said, but more likely by Colonel Robert Sidney, to whom and to whose brother Algernon she had lately been mistress. When in 1656 she came with her son to London, she was treated as the king's wife, and by Cromwell was sent to the Tower, and then back to Paris. Charles sought out the boy and committed him to the care of Lord Crofts, who gave him his own name. In 1662, after the Restoration, 'Mr James Crofts' of England with the queen-dowager, and was handsomely lodged at Hampton Court and Whitehall. In 1663 he was created Duke of Monmouth, and waited to a rich heiress, Anne, Countess of Bedfurch (1651-73); in 1670 he succeeded Monk as Lord-General, and received the traditional title of Duke of Bedfurch. A poor, weak libertine, he yet became the idol of the populace, thanks to his beauty and his affability, to his humanity towards the Covenanters at Bothwell Bridge (1679), to the agitation of the Popish Plot, and to the Exclusion of William and Mary. He made semi-rival progresses in the west and the north of England (1680-82). There were rumours of his legitimacy, the proofs in a certain 'black box;' and Shaftesbury knew how to pit the 'Protes-
tiant Duke' against the Popish hear-presumptive to
the throne, how to enmesh him in the Rye-house Plot (1683), on whose discovery Monmouth fled, as
four years before, to the Low Countries. There he
remained until Charles's death, in which, in concert
with Argyll's Scotch expedition, with eighty-two
followers he invaded England. On 11th June 1655
he landed at Lyme-Regis, and issued a manifesto
branding James as a murderer and popish usurper,
and asserting his own legitimacy. He was received
with acclamations at Taunton, where he was himself proclaimed King James II.; and on the early morning of 6th June,
after a roundabout march to near Bristol and Bath,
ittempted with 2800 foot and 400 horse (peasants
mostly and miners), to surprise the king's forces,
7200 strong, which under the Earl of Feversham
were encamped on Sedgemoor, near Bridgewater.
His men could not cross a broad drain, and were
mowed down by the royal artillery, 300 falling on
the field, 1090 more in the pursuit. Monmouth
himself had fled, but on the 8th was taken, dis-
guised as a shepherd, in a ditch near Ringwood.
His bearing before James was dashingly.
He wept;
he crawled to his feet; he even offered to turn
Catholic. No; on 15th July he was bunglingly
beneath on Tower Hill, and buried in the chapel of
Parliament, next to the tomb of the former king,
him six children; but his last thoughts were all
with his mistress, Lady Henrietta Wentworth, who
died of sorrow nine months after him. In the
'Bloody Assize' that followed the rebellion, Judge
Jeffreys hanged 321 rebels, transported 93 to the
plantations, and whipped or fined 33 others.

See G. Roberts, Life of Monmouth (2 vols. 1844), with
works cited at Charles II. and James II.

Monmouthshire, a county in the west of
England, bounded N. by Hereford, E. by Glou-
cester, S. by the estuary of the Severn, and W.
and N.W. by South Wales. With a maximum
length and breadth of 32 and 28 miles, it contains
578 sq. m., or 370,350 acres, of which more than one-
half is under permanent pasture, and about one-
twelfth in woods. Pop. (1801) 43,582; (1841)
134,368; (1891) 229,260. Its surface is for the
most part gently undulating, rising, however, in the
west (the Sugar Loaf is 1954 feet high), but
the Caldicot and Wentloog Levels, which for a distance
of 25 miles skirt the southern coast, are so low as
to require in places the protection of sea-walls and
earthworks. The Wye, with its tributary the Monnow,
the Usk, Elve, and Rumney, all flowing south into the estuary of the Severn, are the
principal rivers. In the rich valleys of the three
former wheat is the principal crop raised, whilst on
the poorer soils on the west side of the county oaks
and holly are chiefly grown. There are also ex-
tensive orchards. The great wealth, however, of Monmouthshire is derived from its minerals, coal
and ironstone abound in the region of Pontypool and
Rhymney. In 1889 coal weighing 6,751,308 tons
and in 1894 the amount of 8,213,556 tons were
raised, but from the soil amount made, and much limestone and other building
stone, as also fireclay, produced. The country
comprises six hundreds, the municipal boroughs
of Monmouth and Newport, and 147 civil parishes.
Three members are returned to parliament for the
county, and for the counties of Monmouth,
Newport, and Usk; the County Council numbers 64. Towns other than the above
are Abergavenny, Blaenavon, Cacerlon, Chepstow,
and Trellech. Monmouthshire, which until 1535
formed a unit, is now divided into three smaller
scenery and for the many remains of feudal castles,
c. scattered throughout it. Of these the finest
examples are the castles of Raglan, Caldicot, and
Chepstow, and the abbey of Llanthony and
Tintern. See the county histories by Williams
(1796) and Coxe (1801).

Monochlamydeae. See CALYX, FLOWER.

Monochord, an apparatus constructed to
exhibit the mathematical proportions of musical
intervals. It consists of a flat board of 4 or
8 feet long, or better 10 feet, where space can be
spared. The breadth of the board is according
to the number of the strings, which are from
two to six. The board is covered with fine white
paper. A straight line is drawn from end to end
below each string, and each line is accurately
divided into the different parts which make up
the full length of the string, as a fundamental sound,
harmonically divided itself (see HARMONICS).
The string is fixed at one end, and rests on a bridge;
while at the other end, where it also rests on a
bridge, it is stretched by a tuning-peg, or by a
weight. The sounds from the strings are produced
by a violin-bow. The monochord is chiefly used in
illustrating acoustical experiments in the proportion
of intervals and temperament.

Monoclinal Strata. See the article GEOLOGY
(Vol. V. p. 152). MOUNTAINS.

Monocotyledons. The higher planer organs
are distinguished from the Gymnosperms by their
closed ovary and seed coat. They are divided into
two main alliances, recognised by Ray and other
predecessors of Linnaeus as monocotyledons and
dicotyledons. The former are readily distinguished,
as the name implies, by the single cotyledon of the
embryonic plant, but also by a number of other
characters, e.g. symposium rhizome of Solomons's Seal, tubers of orchids, &c., but fre-
quently also lengthens into the primary stem of
grown plant (e.g. palms, aloe, maize, &c.);
while young it grows (as in ferns) in the form of
an invertebrate, each successive section being
longer than the preceding until the adult size
reached, when the stem becomes cylindrical, taper-
ing off only at the extreme point. There is thus
usually no secondary growth in thickness (see,
however, DEACENA). The leaves are seldom
chondrulose, and there are no permanent flower
rows is commonest. The leaf-bases are usually
sheathing, and stipules are absent. The lamina
is usually entire, the venation not ridged on the
under side, and usually parallel. The fibro-vascular
bundles of the stem do not anastomose nor form a
ring, but are distributed throughout the whole
stem, which thus does not exhibit the pith nor
separable bark so familiar in many dicotyledons.
The flower consists of alternating and isomerous
whorls, outer and inner perianth, outer and inner
stamens, and usually only one carpelary whorl;
but there are many characteristic specialisations.
The endosperm is usually large and persistent,
but some orders are exalbiniun.

The systematic study of the monocotyledons is
most easily undertaken by clearly familiarising
one's self with the different types of indefinite
aliies, Amaryllidaceae, Iridaceae, &c.; and next by
studying the progress of the floral specialisation,
through Scitamineae to its extreme in Orchidaceae.
Starting again from the lilies and their scarcely
distinguishable allies, the rushes (Juncaceae), we
find the former,-series (more accurately vegetative)
types culminating in the sedges (Cyperaceae) and
grases, commonly grouped as Graminiflorae. Another somewhat
alogous line of change gives us the palms and Aroideae,
grouped at Spadiellore. The Helobies (including Juncaginaceae, Alismaceae, Hydrocharitaceae) are also of special interest, as representing in some respects more primitive forms, and pointing back to a common ancestry with dicotyledons. See Vegetable Kingdom, and minor special articles; also Gmelin’s, Van Tieghem’s, or other text-books of botany. For systematic details, see Engler’s Pflanzenfamilien or the Genera Plantarum.

Monod, Adolphe, an active theologian of the Reformed Church, was born in 1802 at Copenhaghen, the son of a preacher, himself a native of Geneva. He studied at Geneva, and laboured as a preacher at Naples and Lyons, as a professor at Montauban, and again as a preacher in Paris until his death, 8th April 1835. He published sermons and many religious works which were widely popular. His brother, Frédéric, born 17 May 1794 at Monza, in the canton of Vaud, was thirty years a prominent pastor in Paris, and founded in 1849, together with Count Casparin, the Free Reformed Church of France. He edited until his death, 30th December 1863, the Archives du Christianisme. See Adolphe’s Life and Letters (Eng. trans. 1885).

Monodon. See Narwhal.

Monocious (Gr. monos, ‘one,’ and oikion, ‘a habitation’), a term introduced by Linnaeus to describe those plants which have the stamens and pistil of different flowers, but the same species. E.g., hop, box, birch, beech, elder, oak, hazel. Such plants formed one of the classes (Monocica) of the Linnean system, but were obviously a specially artificial alliance, since that partial or complete separation of the sexes to which we apply the terms monocious or dioecious, respectively, is continually found in almost all the most unrelated plants or animals. See Flower, Sex.

Monogenists. See Ethnology.

Monogram (Gr.), a character composed of two or more letters of the alphabet, often interlaced with other lines, and used as a cipher or abbreviation of a name. A perfect monogram is one in which all the letters of the word are to be traced. They are found on early Greek coins, medals, and seals, and on the family coins of Rome, but not on the coins of the earlier Roman emperors. Constantine placed on his coins one of the earliest of Christian monograms, composed of the first and second letters of CHRIST (Christos), a monogram which also appeared on Constantine (see Cross, Vol. III, p. 582; and Constantine); we often find it combined with the first and last letters of the Greek alphabet (Neu. 8). Another well-known monogram is that of the name of Jesus, IHS, from the first three letters of CHRIST. Popes, emperors, and kings of France during the middle ages were in the practice of using a monogram instead of signing their names. Fig. 1 represents that of Charlemagne, a perfect monogram, in which all the letters of Karolus can be traced. Painters and engravers in Germany and Italy were used to a large extent as a means of distinguishing their works. Fig. 2 is the monogram of Albert Dürer. The first typographers made use of monograms or ciphers, a series of which, well known to the bibliographer, fixes the identity of the ancient editions, German, Italian, and English, from the invention of printing down to the middle or end of the 16th century. Those of William Caxton and Gaspar Philippe, an old Paris printer, will be found at Book, Vol. II.

303. See Brulliot, Dictionnaire des Monogrammes (1834); Duplessis, Dictionnaire des Monogrammes (Paris, 1887). Pottery marks will be found at Pottery.

Monograph (Gr.), a work in which a particular subject in any science is treated by itself, and forms the whole subject of the work—‘an all-sided and exhaustive study of a special or limited subject.’ The term is often loosely used for a small book on miscellaneous topics.

Monolith. See Standing-Stones.

Mononemia. See Insanity.

Monometallism. See Bimetallism.

Monongahela, a river which rises in West Virginia and flows north to Pittsburgh, where it unites with the Allegheny to form the Ohio.

Monophysites, Christians who hold that Christ has only one nature (Gr. monos, 'one'; physis, 'nature'). See Greek Church, Vol. V, p. 398.

Monopol, a town of Southern Italy, on the Adriatic, 43 miles by rail NW. of Brindisi, with a cathedral, extensive walls, and a castle built in 1592 by Charles V. Pop. 13,015.

Monopoly is properly definable as the sole or exclusive right of selling or trading enjoyed by an individual or group of individuals. In its strict sense monopoly belongs to an economic era which has passed away. During medieval times and the period that followed, exclusive rights prevailed in almost all departments. There were monopolies or rights which circumscribed individual action. The city and the guild had their spheres of production and of trade more or less clearly defined, and more or less thoroughly recognised in practice. The central governments which arose on all lines of the mediæval system continued to recognise such exclusive rights, sometimes conferring on favoured individuals the sole privilege of selling the most necessary articles of life, in other cases granting to great companies the monopoly of trade over immense regions of the world. It is with these and instances that the name monopoly is most strictly associated in history. The last parliament of Elizabeth, held in 1601, pronounced an emphatic condemnation of the monopolies granted by that queen, and even she had to yield to the storm. Until almost the most modern times monopolistic articles whose sale was thus subject to monopoly. One of the members made a sensation by asking: 'Is not bread among the number?' Curiously enough, the previous year saw the foundation by royal charter of the greatest of the companies which were based on the exclusive right of trade in an immense foreign market, the East India Company. The opposition to monopolies at home continued under the Stuarts, and their abolition may be regarded as one of the important results of the great parliamentary struggle of that time.

The social revolution has tended to the abolition of such monopolies, whether vested in individuals, in trade corporations, or in great companies engaged in foreign commerce. But, while the monopoly of law has so far passed away, new tendencies towards a monopoly of fact have been setting in. Under these monopolistic conditions, it is indeed a problem to the competitor to secure as far as possible the exclusive sale of the commodity in which he deals, either in the world-market or over a given portion of it; and when the single competitor is not strong enough to accomplish this, he seeks to attain his object by forcing the others to stop, or to engage in the same business. The modern trust syndicate or union is the outcome of such efforts; and the great danger attendant on such gigantic combinations is the establishment of a monopoly
injurious to society. The trust considered in its social and economic aspects, to act for discussion; there can be no doubt that it establishes or seeks to establish a monopoly of fact. As regards the United States it may be maintained that such a monopoly is favoured by Protection; but in view of the fact that the same tendency is observed over a portion of it, the tendency towards a monopoly of fact is involved. In conclusion, reference should be made to monopolies, as in tobacco, retained by certain governments, but purely for revenue purposes. It was part of the later fiscal policy of Bismarck to establish such a state monopoly in spirits. See Farmers-General.

**Monotheism**, the term usually employed to denote a belief in the unity of the Godhead, or belief in and worship of one God. It is thus the opposite of Polytheism. The doctrine of the Trinity is thought by some (e.g. the Unitarians) to be inconsistent with the mother tongue taught by Jesus Christ, and is therefore rejected as no part of His teaching. Mohammedans and Jews, of course, reject with vehemence the least approach to a Trinitarian conception of the Deity.

**Monotheism** (Gr. monos, 'single,' and thelein, 'to will'), the doctrine that Christ had only one will. It is a modification of Unitarianism. See Ecumenism, ETHIOPIA, Vol. V, p. 389.

**Monotremata** (Gr. monos, 'single;' trime, 'an opening'), the lowest order of mammals, in many of their characteristic points indicate an approximation to reptiles. The skull is smooth; the brain-case very small as compared to the face; the snout much prolonged, and the jaws unprovided with soft movable lips, and not furnished with teeth, except in the young Ornithorhynchus, where they have been discovered by Poulton and Thomas. The cranial bones coalesce, as do a bird's, at a very early period, and leave no signs of sutures. The external ear is altogether absent, while the eyes, though small, are perfectly developed. The bones of the shoulder, forming the scapular arc, are unlike those of any other mammals, and resemble those of reptiles. At the top of the stem-bone is a root, bone, formed by the union of the two clavicles, corresponding to the furculum in the bird's skeleton, and to the clavicles and interclavicle of the reptile. The coracoid bones, which in other mammals are mere processes of the scapula, are here extremely large, and assist in strengthening the scapular arc; they are produced beyond the socket of the humerus (the glenoid cavity), so as to articulate with the sternum. The pelvis is provided with marsupial bones. The ovaries are analogous to those of the Sauropsida (reptiles and birds), the right ovary being considerably developed, while the left has for the most part degenerated. The ova are deposited in a shell, and the young has the earlier discovery that these mammals lay eggs furnished with a thick shell. The Echidna carries its eggs in its pouch, but the Ornithorhynchus deposits them in itsutwomb. The mammae glands, of which there is only one on each side, are not provided with nipples, but open by simple slits on each side of the abdomen. It has been proved, moreover, that the mammae glands are altogether different from those of other mammals, and only functionally resemble them.

This order includes only two or three species, all natives of Australia or Van Diemen's Land, which, however, form two families—the Ornithorhynchidae (see Ornithorhynchus) and the Echidnidae (see Echidna). From that name known of the teeth of Ornithorhynchus that some of the Mesozoic mammalian remains which were formerly referred to the Marsupialia are really those of Monotremata. The literature of the group is fully referred to in The Catalogue of Marsupialia and Monotremata (British Museum).

**Monreale**, a city of Sicily, 5 miles SW. of Palermo. The 'royal mount,' from which it gets its name, is 1231 feet high, and on it stands the famous cruciform Norman cathedral (1176), which measures 333 by 132 feet, and within is entirely covered with mosaics. Pop. 13,898.

**Monro, Alexander**, founder of the medical school of Edinburgh, styled primus to distinguish him from his son and successor. Born in London, September 8, 1607. His grandfather, Sir Alexander Monro, a colonel in the army of Charles II. at the battle of Worcester in 1651, was afterwards an advocate at the Scottish bar. Alexander Monro studied at London under Hawklee, Whiston, and Cheesleton, at Paris under Quenet, and at Leyden under Boerhaave, and after 1719 lectured at Edinburgh on anatomy and surgery. His lectures, with those of Alston on botany, led to the founding of the medical school, when Monro was appointed professor of Anatomy in 1721. He was received into the university in 1725. For forty years he lectured regularly on anatomy and surgery from October to May, students coming from all parts of Britain to hear him. Of the establishment of the Royal Infirmary of Edinburgh he was one of the two principal promoters and he there delivered clinical lectures. In 1759 he resigned the anatomical chair to his youngest son, Dr Alexander Monro, but continued his clinical lectures at the Infirmary. His principal works are Osteology (1726), Essay on Comparative Anatomy (1744), Observations Anatomical and Physiological (1758), and an Account of the Success of Inoculation of Smallpox in Scotland (1765). He died July 10, 1767. He was a Fellow of the Royal Society of London, and of various foreign societies. A collected edition of his works, with Life, was issued by his son (1781)

**Alexander Monro, secundus** (1733-1817), youngest son of the preceding, studied at Edinburgh, Berlin, and Leyden, and succeeded his father in the chair of Anatomy, and as secretary of the Royal Society of Edinburgh. He was much occupied on the nervous system (1783), on the physiology of fishes (1785), and on the brain, the eye, and the ear (1707).—He again was succeeded by his son, **Alexander Monro, tertius** (1733-1859), who wrote on hernia, and on the stomach, and an Anatomy of the Virgin Body (1794).

**Monroe**, a city of Michigan, on the Raisin River, 2 miles by a ship-canoal from Lake Erie, and 40 miles by rail SSW. of Detroit. It contains a number of flour-mills, a woolen-mill, and other manufactories. Pop. (1900) 5,043.

**Monroe, James**, fifth president of the United States, was born in Westmoreland county, Virginia, April 28, 1758, the descendant of a family.
of Scottish extraction which had emigrated to Virginia a century before. He entered William and Mary College at the age of eighteen, but soon threw aside his books, with a number of his fellow-students, to run away and join the army. He was present at several battles, and was wounded at Trenton; he afterwards attained the rank of lieutenant-colonel as an aide-de-camp and military commissioner, but was disappointed in his efforts to obtain a commission in a Virginia regiment, and attempted himself to defend himself with whom he studied law. In 1782 he was elected to the assembly of Virginia and appointed one of the executive council. Next year he was returned to congress, where he sat for three years, and in 1785 was chairman of a committee whose report ultimately led to the adoption of the Constitution at Philadelphia in 1786 and 1787, at which the constitution of the United States was framed. Monroe himself was a member of the Virginia convention held to consider the ratification of the proposed constitution, which, along with Patrick Henry and other Virginians, he opposed, fearing the power and encroachment of the Federal government. He was a member of the United States senate from 1799 to 1802, and offered a determined opposition to Washington and the Federalists; yet the government appointed him to succeed Governor Jefferson to Louisiana, where he found himself very popular with the revolutionary government, until he was recalled in 1796 for displaying too decided French sympathies. On his return he published (1797) an attack on the executive for their treatment of him, and, although Washington himself, who had then retired, took no notice of it, the book brought on a bitter controversy and made Monroe the darling of the Democrats. He was governor of Virginia from 1799 to 1802, and then Jefferson sent him as an extra plenipotentiary to France, where in 1803 he and Robert R. Livingston effected the purchase of Louisiana (q.v.). The next four years were spent in less successful diplomacy at London and Madrid; he failed in his negotiations with Spain for the cession of Florida, whilst a treaty which he finally concluded with Great Britain provided neither against the extension of the American seaboard, nor for an indemnity for American losses by seizures at sea, and Jefferson refused to refer it to the senate. Monroe promptly returned home and drew up another defence, and the Virginians endorsed his conduct and policy by a third time electing him to the assembly. In 1811 he was again chosen governor of Virginia. In the same year Madison made him secretary of state; this post he retained till 1817, and during 1814-15 he acted also as secretary of war.

In 1816 Monroe was elected president of the United States, and four years later he was re-elected almost unanimously; the acquisition of Florida from Spain (1819), and the settlement of the vexed question respecting the extension of slavery by the Missouri Compromise, by which, after the reception of Missouri as a slave-state, the institution was prohibited above the line of latitude 36° 30', helped to secure this result. His most popular acts, perhaps, were the recognition of the independence of the Spanish American republics, and the omission in a message to congress (1829) of what has since been called the "Monroe Doctrine." The ultimatum and principle, 'in which the rights and interests of the United States are involved, that the American continents... are henceforth not to be considered as subjects for future colonisation by any European power... With the existing colonies or dependencies of any European power have and interetered, and shall not interfere. But with the governments who have declared their independence and maintained it, and whose independence we have... acknowledged, we could not view any interposition for the purpose of oppressing them, of controlling in any other manner their destiny, by any European power in any other light than as the manifestation of an unfriendly disposition towards the United States.' In 1825 Monroe retired from the seat at Oak Hill, London county, Virginia, where he acted as justice of the peace, a record of office in the administration of Virginia, and member of the state convention; but a sudden generosity and hospitality caused him to be overwhelmed with debt, and he found refuge with his relations in New York, where he died in 1831—like his predecessors, Adams and Jefferson, on the North American continent. In 1838 his remains were removed to Richmond. Monroe was an upright and consistent statesman, and a faithful servant of his country, though he had not the brilliant talents of some of his great contemporaries. See the Lives by J. Q. Adams (1850) and D. C. Gilman (1883); Historical Sketches of the Monroe Doctrine (1885)—really compiled by J. Q. Adams (q.v.); W. F. Reddaway, The Monroe Doctrine (1898).

Monrovia. See Liberia.

Mons (Flem. Bergen), the capital of the Belgian province of Hainaut, on the Terhul, 38 miles SSW of Brussels. Its fortifications, renewed and strengthened since 1818, were demolished in 1862; but the great earthwork surrounding it called the Canal de Condé connects Mons with the Scheldt. The church of St Waudru (1450-1589) is a master-piece of Gothic; and there are a town-hall (1458), a belfry (1602) 275 feet high, a good library, &c. The manufactures include woolen and cotton goods, cutlery, and other wares. The vicinage forms an extensive coalfield. Pop. (1875) 24,539; (1895) 25,330. Mons, occupying the site of one of Cesar's camps, was made the capital of Hainaut by Charlemagne in 804. France, Spain, and Austria often contended for its possession. See Bossens's Histoire de Mons (2 vols. 1868).

Monsignore, a title of honour given to prelates of the Roman Catholic Church. Formerly in France the corresponding title of Monseigneur was allowed to all high dignitaries of the church, to the princes of the blood-royal, to the higher nobles, and to the presidents of the superior law-courts. But from the time of Louis XIV. Monseigneur became the ordinary addition as appropriate to the title of the Dauphin.

Monsoon is derived from the Arabic Massiim, 'a set time,' 'season,' and was for long applied to those winds prevailing in the Indian Ocean which blow from the south-west from April to October, and from the opposite direction, or north-east, from October to April. The monsoons, in common with all winds whether regular or irregular, depend primarily on an unequal distribution of temperature and moisture over that portion of the earth's surface where they occur, which in their turn give rise to an unequal distribution of atmospheric pressure. From this unequal distribution of the mass of the earth's atmosphere winds take their rise—winds being simply the flow of the air from a region of higher towards a region of lower pressure, or from where there is a surplus to where there is a deficiency of air. The term monsoon in recent years come to be used with a wider significance than formerly; it is now generally applied to the winds connected with all continents which are of regular occurrence with the periodical return of the seasons. The winds of Australia are thus strictly monsoons; over the greater part of the Pacific Ocean the prevailing winds have a well-marked monsoonal character; similarly, monsoons

278 MONROE

---

MONSOON
occur on the coasts of Brazil, Peru, North Africa, and all other regions that happen to lie between regions whose temperature, and necessarily their pressures also, differ markedly from each other at different times of the year. See WIND.

Monstrance (Lat. monstrare, 'to show'), called also ostensorium, the sacred vessel employed in the Catholic Church for the purpose of presenting the consecrated host for the adoration of the people, as well while it is carried in procession as when it is exposed upon the altar, on occasions of special solemnity and prayer. It consists of two parts, the foot or stand upon which it rests, and the shrine in which the host is exhibited. The latter contains a small semi-circular holder called the lunula, or crescent, in which the host is fixed, and it appears anciently to have been of a cylindrical or tower-shaped form, in the central portion of which, consisting of a glass or crystal cylinder, the host was placed. At present it is more commonly in the form of a star or sun with rays, the central portion of which is of glass or crystal, and serves to permit the host to be seen. This portion, or at least the crescent, is of gold or of silver gilt; the rest is generally of the precious metals, or at least gilt or silvered, although the lower portion is occasionally of bronze artistically wrought.

Monstrosity is the term applied in human and comparative anatomy to an aberrant formation of the body consequent upon early disturbances in the developmental processes in the embryo. Teratology (teras, logo), the special and very interesting branch of biology which deals with the causes of such occurrences and with the classification of 'monsters' so produced, has been advanced by the researches of Geoffrey Saint-Hilaire, Förster, and others to the position of a special science, and one that throws a valuable sidelight on that of normal embryology. The malformations to be dealt with may affect the whole organism or portions only of its structure. Monsters are, however, usually classified under three headings: (1) Those with exaggerated or supernumerary parts (monstra per excessum); (2) those lacking parts (monstra per defectum); and (3) those with abnormally arranged parts (monstra per fabricationem aberratae). Those of the first class, where supernumerary limbs or a double head or trunk exist, are generally recognised as due to the more or less complete fusion of two or more embryos, originally separate, during the process of development. Cases of otherwise complete bodies may be attacked by those in whose content has time been carefully described, or preserved in museums show that almost every possible degree of fusion of separate embryos may occur, resulting in a correspondingly great variety in the shapes of the monsters produced. Two otherwise complete bodies may be attached by an external bond, as in the case of the Siamese twins; or the one may be wholly or partially enclosed by the tissues of the other. A case of such complete inclusion is found in the Hunterian Museum. Much more frequently, however, but imperfect relics of the one remain attached to, or fused with, the fully-developed structures of the other. Thus arise two-headed monsters, those with double trunk, or whole embryo doubled, and those in which a shapeless mass representing the blighted embryo remains attached to the fully-formed body of the twin organism. In this same class of monsters by exaggeration must be placed also cases of general or local gigantic development, due not to fusion of separate embryos but to general or local precocity of growth in the tissues of a single organism. Not less interesting are monsters of the second class, where entire parts of the body may be suppressed during development. Here again it is shown that the non-development may occur in any region and to any extent; consequently numerous and widely separated varieties of monster are found in this class. The suppression of parts varies likewise in degree, and in its effect upon the viability of the organism. For instance, a headless or brainless monster is of necessity incapable of living, whereas one with suppression of a limb is viable, and might more properly be described as a case of congenital deformity. In the third class are the cases of transposition of viscera, malposition of limbs, congenital dislocations of joints, &c. See DEFORMITY, CLEFT LIP, &c.

Montagnana, a town of Northern Italy, 32 miles SW. of Padua. Pop. 3200.

Montagnards, or simply Montagne, 'the Mountain,' the name given to the extreme democratic politicians in the first French Revolution, because they seated themselves on the highest benches of the hall in which the National Convention met. The body included both Jacobins and Cordeliers; its principal members were Danton, Marat, Robespierre, St Just, and Collot d'Herbois, the men of 'the Reign of Terror.' The antagonistic party were 'the Plain,' the Girondists (q.v.), who sat on the lowest benches, on the floor of the house. After the overthrow of the Girondists this part of the house was styled 'the Marsh or Swamp,' and included all the members whose votes were under the control of 'the Mountain.' In 1848 the extreme party in the National Assembly, composed of revolutionary democrats and communists, sometimes flattered itself by assuming the title of 'the Mountain.'

Montagu. The illustrious family of Montagu springs from Drogo de Montacute, who came from Normandy with the Conqueror. Sixth in descent from him was Simon de Montague, grandfather of the William de Montaente, created Earl of Salisbury in 1357, many of whose successors have been great historical personages. The subsequent family of Montagu descended from Simon (younger brother of the third Earl of Salisbury), who was the ancestor of Sir Edward Montagu, Speaker of the House of Commons and afterwards Lord Chief Justice, who died in 1537. His son, Sir Edward Montagu of Boughton, had six sons; Edward, the eldest, was made Baron Montagu of Broughton; and his grandson Ralph, third baron, was (1689) created Earl of Montagu, and in 1705 Duke of Montagu. In his line the first of the Baron Montagu became extinct. The third son of Edward of Broughton was Sir Henry Montagu, the famous lawyer and orator, who was Lord Chief-justice, and created Lord Montagu of Knibolton, and afterwards (temp. Charles I.) Earl of Manchester (q.v.). His son (second son) was by an extraneous marriage to a commoner, and hence not eligible to the peerage. His grandson, John, gained distinction by his victory over Prince Rupert at Marston Moor, but subsequently gave in his adhesion to Charles II. on his restoration. The fourth Earl of Manchester was
an enthusiastic follower of William III., fighting with him at the battle of the Boyne, and taking part in the siege of Limerick: he was eventually created Duke of Manchester in 1719 by George I. His descendant, the eighth duke, succeeded in 1898. The sixth son of Edward of Bughton was Sir Henry Montagu, who, though a considerable mathematician, and having served in the army, then in the navy, became the first sole commander of the English navy, and was created by Charles II. Lord Montagu of St Neots, Viscount Hinchingbrooke, and Earl of Sandwich. His descendant, the eighth earl, succeeded in 1894.

Montagu, Lady Mary Wortley, born about 1689, was the daughter of Evelyn Scoltide, the eldest of the four sons of Evelyn Pierrepont, Earl (afterwards Duke) of Kingston. She was a clever, attractive child, the pride and delight of her father, who, having lost his wife in 1694, and continuing a widower, introduced her daughter to society, and made her preside at his table at a very early age. When she was only eight years old he introduced her to the famous Kit-Cat Club, and she was formally admitted a member. In 1712 she married, without the consent of her father, Edward Wortley Montagu, eldest son of the Hon. Sydney Montagu, and grandson of Sir Edward Wortley Montagu. For more than three years after her marriage she lived at Wharncliffe Lodge, near Sheffield, where her son was born, her husband during this time being kept principally in London by his parliamentary duties. On the accession of George I. Mr Montagu obtained a seat in the Treasury Board, and from this time Lady Mary lived in London, where she gained a brilliant reputation by her wit and beauty, and was on terms of intimate friendship with Addison and Pope, and other literary men of the day. In 1716 Mr Montagu was appointed ambassador to the Porte, and in August of that year he set out for Constantinople, accompanied by his wife. They remained abroad till 1718, and during this time Lady Mary wrote the well-known Letters to her sister, the Countess of Mar, Pope, and other friends. The Letters give a true description of Eastern life as the writer saw it, and are in a clear, bright style, sparkling with wit and humour. While in Turkey she witnessed Inoculation (q.v.), and introduced it into England on her return, having so much faith in its safety that she tried it first on her own son. The next twenty years of her life she spent in Turkey, and in 1736 she left her husband at Twickenham, where she renewed her intimacy with Pope, and then quarrelled with him, the immediate cause of the quarrel being the publication by Lady Mary of six satirical sketches entitled Tocque Élogues. In 1739, for reasons which are not well known, she left England and her husband, from whom, however, she parted on very good terms, though they never met again. She lived in Italy, first on the shores of the Lake of Iseo, and afterwards at Venice till 1761, when, at the request of her daughter, the Countess of Bute, she returned to England. She died August 21, 1769. A collected edition of her works, with Life, was published by her great-grandson, Lord Wharncliffe (3 vols. 1837; 3d ed. 1887.).

Montagu, Charles. See Halifax (Lord).

Montaigne, Michel Eyquem de, was the third son of Pierre Eyquem, Seigneur de Montaigne. He was born in 1533 on the family estate in Perigord. His father had ideas of his own on the best method of living, and his life was to have the full benefit of them. The first novel step was the putting of Michel out to nurse in a village on the estate, that he might be early inured to simple habits of living, and learn to sympathise with the lot of the poor. Whether or not the result of this early association, it is the fact that in his after life Montaigne always spoke of his poorer neighbours with a respect and kindliness of tone remarkable in the age and class to which he belonged. It was the received opinion at the period of Montaigne's childhood that no boy could grow into a creditable citizen without a severity of training which would now be called brutal terrorism. It was the distinctive feature of Pierre de Montaigne's system, however, that boyhood should be made as happy as parents and teachers could make it, and in the upbringing of his famous son he was even whimsically humane. Every morning he had the boy, awakened by the sound of some musical instrument, because he had heard 'that it disturbs the tender brain of children to awake them suddenly.' As he wished to make his son a scholar, and Latin was, therefore, an indispensable acquisition, he had the idea of converting a task into a natural pleasure. Till the age of six the boy was taught to speak no language but Latin, his tutor (a German), his parents, and even the domestics addressing him in that language. The result was that in the conversational command of Latin Montaigne had from boyhood the advantage of the best scholars of his time. His acquisition was less successful in a novel method he also adopted in having him taught Greek.

When Montaigne reached the age of six his father 'allowed himself to be won over to common opinion,' and sending him to a school in the neighbouring city of Bordeaux—earlier a collegiate town—then, he himself tells us, the best in all France. His father, who as a former mayor had considerable influence in the city, 'made several stipulations against the rules of colleges, though, all the same, it still remained a college.' At this school Montaigne remained five or six years, and the last of his successive teachers, among whom were two scholars of European celebrity, George Buchanan and Marc-Antoine Muret. The course of study in the college was almost exclusively the reading of Latin authors, and in after life Montaigne affirmed that, so far as he could judge, all these years were lost.

As a thirteenth he had to choose between law and the church—only the eldest having the privilege of wearing the sword. All his life Montaigne had an imperious difficulty in making up his mind, and on this occasion his father sent him the trouble by setting him to the study of law. In what school he pursued his legal studies has not been discovered, all that we know of them being summed up in his own sentence—'While a child I was plunged up to the ears in law, and it succeeded.' From the age of thirteen to twenty-four Montaigne is almost lost sight of. Casual references in his Essais prove that during this period he was frequently in Paris, that he knew something of court life, and that he took his full share of its pleasures. His legal studies made, for their reward, a yellow parchment as member of the Court of Aides in the district of Perigord; and in 1557, by the consolidation of this court with the Parlement of Bordeaux, Montaigne became a city counsellor. The office was an honourable one; but it was little to Montaigne's taste, who, in truth, is never weary of telling us that every form of restraint was against all his natural inclinations. It was during his tenure of this office, however, that he formed his famous friendship with Etienne de La Boéte, a relation which he always regarded as the happiest and most important of his life. La Boéte seemed in gifts of soul and intellect the equal of the greatest characters of antiquity. From the writings La Boéte left behind him—a series of sonnets, and a political pamphlet advocating extreme republicanism—it seems probable that
Montaigne exaggerated his friend's powers. However this may be, the memory of La Boétie, who died at the age of thirty-two, was the one thought that beset him to the last. Montaignter always lived for himself, and that adds the one romantic touch to his epicurean temper.

Montaignter held the office of counsellor for about thirteen years; but of this period of his life, also, no definite history has been recovered. From incomplete data, however, we can gather that there was a familiar with the court of Francis II., that he saw and greatly admired Mary Queen of Scots, and that at some time or other he was 'gentleman of the bedchamber in ordinary,' an office that did not necessitate residence at court. From Charles IX. he received the order of St. Michael, instituted by Louis XI., and once a coveted honour, but in Montaignter's day somewhat faded in its lustre. At the age of thirty-four he married Françoise de la Chassaigne, the daughter of one of his fellow-counsellors in Bordeaux, though in taking the step he assures us that he merely yielded to convention, as of his own inclination he 'would not have married Wisdom herself.' As the times went, Montaigne was a faithful and considerate husband; but he makes no secret that his wife held but a sub-ordinate place in his life, and that of his three children (the expression is his own) in their infancy, and was survived by one daughter, of whom, as he speaks little in his writings, it may be concluded that she was bound to him by no peculiar tie of affection. A year after his marriage, at the request of his father, he translated the Natural History of Raymond de Sebond, a Spaniard, who, in the preceding century had professed theology, philosophy, and medicine at Toulouse. This translation is noteworthy as being Montaigne's first effort in literature, and as having afterwards supplied material for many of his essays. From his Apologie de Raymond Sebond, in which he exhibits in all its bearings the full scope of his sceptical philosophy. Two years later he published certain literary remains of his friend La Boétie.

In 1571, his two elder brothers being dead, Montaignter returned to the family estate, and here till his death in 1592 he lived the life of a country gentleman, varied only by a few visits to Paris, and by eighteen months' travel in Germany, Switzerland, and Italy. It was during this period that his friendship with the imperious and capricious de Retz sprang. Retirement to his château that some mental occupation was imperatively necessary to save him from morbid fancies, he began those Essais which were to give him a place among the first names in literary history. If we know few incidents regarding this period of his life, we have at least the minutest record of his entire surroundings, of his daily manner of life, of his tastes, his habits, his speculations and imaginings. In June 1580, partly on account of his health, and partly from his strong natural curiosity to know strange countries, he set out for his Grand Tour which he had long planned. His record of this journey, dictated to his secretary, and partly written in his own hand in French and Italian, was discovered in his château, and first published in 1774. While at the baths of Lucca, the announcement came to him that he had been unanimously elected mayor of Bordeaux. In accordance with his distaste for practical life, he at first refused the appointment; but, at the instance of his friends and on the command of Henry III., he withdrew his declination. The office, which had been held by his father before him, was of high military as well as civil rank, his immediate predecessor having been the Duc de Biron, one of the marshals of France. In spite of his natural indolence and indecision, he must have performed his duties to the satisfaction of the citizens, as they did him the unusual honour of re-election. Of his last years the only circumstance deserving special record is his relation with Mademoiselle de Gournay, who won both the love and esteem of Montaigne above himself, and that adds the one romantic touch to his epicurean temper.

Montaigne held the office of counsellor for about thirteen years; but of this period of his life, also, no definite history has been recovered. From incomplete data, however, we can gather that there was a familiar with the court of Francis II., that he saw and greatly admired Mary Queen of Scots, and that at some time or other he was 'gentleman of the bedchamber in ordinary,' an office that did not necessitate residence at court. article upon Sweden, which appeared in the Revue Française. In 1830 he went to Ireland, and, returning full of enthusiasm for religious freedom, at once eagerly joined himself to the Abbe Lanmanais and Lacordaire in their enterprise of the *Avenir*, the well-known High Church Liberal newspaper. In 1831 Montalember and Lacordaire opened a school in Paris, which was immediately closed by the police, and a prosecution commenced against the schoolmasters. The death of Montalember's father at this time having raised him to the peerage, he appealed to be tried by his peers, and pleaded in this way the common interests of religious liberty. Though he was reprimanded and fined 100 francs, this defeat had the effect of a victory. In the same year the *Avenir* was temporarily suspended, and finally given up, being condemned by the pope. After this Montalember for a time withdrew from France and lived in Germany, where he was inspired with the idea of writing the *History of St. Elizabeth*, which was published in 1836. In 1833 he returned to Paris, and made his first speech as a member of the Chamber in defence of the liberty of the press, and in support of the rights of the French Church, which was attacked in 1836. The winter of 1842 he spent in Madeira for his wife's health, and while there wrote a pamphlet entitled *Desvois des Catholiques dans la Question d'Enseignement*, in which he protested against the monopoly of education by the French University, and pleaded for free instruction, or, in other words, religions education guaranteed by common liberty. For this cause he fought unceasingly in parliament till it was won. His protest against tyranny, however displayed, came to a climax in a great speech in January 1848 on Swedish liberty. Revolution place a much later; and in April Montalember was elected a member of the National Assembly. When the coup d'etat of December occurred he supported Louis Napoleon till the confiscation of the Orleans property. Then he at once resigned his post as a member of the Consultative Commission, and became from henceforth a determined opponent of the imperial régime. He was elected to the Academy on February 5, 1852, and from that time occupied himself with literary work. After a visit to England in 1855, he wrote *L'Avenir politique de l'Angleterre* (1858), *Le Peuple et la Pologne* (1864), &c. During the last ten years of his life he suffered from the malady of which he died in Paris on 13th March 1870, sixteen days after writing his celebrated letter on papal infallibility.

Montalember was one of the best French orators of the day. He was a polished man of the world, and a devoted, noble-minded son of the church. He loved freedom more than all the world, and the Catholic religion more than freedom; and thus, while he fought all his life for freedom, in questions of faith he submitted his will to the control of Rome. See the Memoir by Mrs Oliphant (2 vols. 1872).

**Montana**

One of the north-western states of the American Union, extends from 41° 11' to 116° W. long., and from 44° 13' to 49° N. lat., and is bounded N. by the Canadian districts of Alberta and Assiniboine, E. by North and South Dakota, S. by Wyoming and Idaho, and W. by Idaho. In area 146,080 sq. m., or nearly five times the size of Scotland—it ranks third among all the states and territories, but in population only forty-four: the density of the population is but 1.7 persons per square mile.

The Rocky Mountains, with their subsidiary ranges, occupy fully one-fifth of the surface, in the south and west; the rest of the state is made up of valleys or high, rolling prairies, treeless, but yielding nutritious grasses. The head-waters of the great rivers which flow from Idaho, Montana, and Wyoming, the Missouri and the Ohio, which join the Mississippi—flowing through Canada and the United States—have their sources in Montana. The mean elevation of the state is about 3000 feet; the average height of the Rocky Mountains—whose sides are covered with dense forests of pine, fir, and cedar—is about 6000 feet, while the highest peaks rise to 10,000 or 12,000 feet.

The Yellowstone National Park (q.v.) forms part of the southern boundary of the state. In the south-east the Bad Lands extend into the state from Wyoming (q.v.). The climate of Montana is more moderate than that of the Dakotas and Minnesota, which lie to the north, and more amenable to the climate of the north-west; the climate is too dry in the air, the winters are less chilly and more exhilarating than in the east. The atmosphere is remarkable for its cleanliness, and cyclones are unknown.

The soil of Montana contains all that is needed for sustaining vegetation, but it is almost valueless without irrigation; with that, however, the yield of grains and vegetables is enormous. There are already hundreds of irrigating ditches within the state, and the state is beginning to construct storage reservoirs all along the Rocky Mountain range, to store water for this purpose from the melting snows in spring-time. It is calculated that 26,000,000 acres of land can thus be brought under cultivation. placer mining being practically exhausted, a large part of the population has turned its attention to stock-raising, for which Montana is better suited than for agriculture. The prairies produce several varieties of bunch grass, which eures on the stalk in August, and retains all its nourishing qualities throughout the winter; the state publishes a calendar of the weather for summer or winter, and very little shelter is required.

But the great industry of Montana is the mining and reduction of her gold, silver, lead, and copper ores. Her minerals first attracted emigration, and have hitherto been her principal wealth. The first systematic working of placer mines for gold commenced in 1862; in 1863 the first gold-quartz mill was built. A report issued by the state (1898) gives the total value of gold and silver produced in Montana from 1862 to 1897 (both inclusive) at: gold, $25,533,719; silver (current value), $237,933,365; total, $350,567,120. The output of 1897 was: gold, 217,515 ounces; silver, 16,307,346 ounces; copper, 237,153,540 lb., nearly one-half the total product for the United States; lead, 25,794,974 lb.; with a total value of $33,064,675.

Ihternally, an area of Montana east of the Rocky Mountains was part of the Louisiana Purchase; that lying to the west formerly composed a part of Oregon and Washington states. It was first visited by the French in 1742-43, and by Lewis and Clarke in 1804-6: these were the first to follow the route of discovery of the Jesuit missionaries, who established schools for Indian boys and girls. Gold was discovered in 1861, and mining began in earnest the following year. In 1864 the territory was organised, and on 8th November 1889 Montana became a state of the Union. Education, for a frontier state, is well
MONTAJNISM

Montaiguis, a town in the French department of Loiret, 47 miles E. by N. of Orleans, with a fine church (12th century—1868) and ruins of a vast castle, once 'le berceau des Enfans de France.' Here in 1731 is said to have occurred the famous duel between the dog of Montaguis' and Macaire its master's mastiff. The narrow street not only showed the spot in the forest of Bondy where its dead master was buried, but singled out the murderer, and, when Charles VI. granted the order of battle to test his guilt, the dog flew at his throat and so proved its charge upon his body. Pop. (1872) 8196; (1886) 10,984; (1891) 9789.

Montauban, the capital of the French department of Tarn-et-Garonne, on the river Tarn, 31 miles N. of Toulouse. A well-built, handsome place, it has a modernised brick bridge (1355), 224 yards long; a fine cathedral (1739) in the Italian style; and a monument (1771) to lugres, the painter, a native. Besides considerable woollen manufactories, it carries on a great trade in wine, grain, leather, &c. Montauban was founded in 1144 by Count Alphonse of Toulouse, because the possession of a large estate in 1317, embraced the Reformaion in 1560, and acquired historical importance as the great stronghold of the Huguenots, being vainly besieged for three months by De Luynes for Louis XIII. in 1621. It suffered much in the Dragonnades; but nearly half the inhabitants still are Protestants, and maintain theological college. Pop. (1872) 18,853; (1886) 22,431; (1901) 24,504.

Montbeliard (Ger. Mompellarg), a town in the French department of Doubs, 48 miles N.E. of Besançon. It lies in a valley between the Jougnoys and Jura mountains, is surrounded by an old château (now a prison), and carries on manufactories of watch-springs, watchmaking tools, and cotton. A possession of the House of Wurtemberg from 1397, it was a Protestant centre from 1525, was formally ceded to France in 1801, and suffered much in the Franco-Prussian war. Cuvier was a native; and there is a statue of him, as also of Colonel Drouet, the heroic defender of Belfort. Pop. (1872) 5865; (1891) 8110, mostly Lutherans.

Mont Blanc, the highest mountain in Europe (if we regard the Caucasus, q.v., as Asiatic), 15,792 feet above sea-level, is situated in France, close to the Italian frontier, 40 miles S. of the Lake of Geneva. The waters which spring from its western slopes are drained off to the Rhone, those which originate on the east side to the Po. It rises into several sharp peaks (aiguilles) and forms great glaciers—the Glacier du Géant, Mer de Glace, &c. In 1760 Saussure offered a prize for the discovery of a practicable route to the summit of Mont Blanc; which was gained, in June 1786, by Belmont and Payen. During his ascent, which ascended the mountain the following year; and since Albert Smith published a description of his ascent in 1851 the mountain has been ascended by several hundred; indeed, more than fifty parties climb it annually. It has been the most conspicuous for accidents of all Alpine peaks; twenty-four persons had perished in accidents on it down to 1886. There is an observatory (1890) at a height of 14,470 feet. See Alps; and Whymper's Guide to Chamonix and the Range of Mont Blanc (1886).

Montcalm, Louis Joseph, Marquis de Montcalm Gezan de Saint-Véran, was born in the château de Candine, near Nîmes, 20th February 1712. At fifteen he entered the army. In 1746

MONTCALM 283

Montcalm, being there (1896), besides the district schools, the State University at Missoula, the Agri-

Cultural College at Bozeman, the State Normal at Dillon, and the State School of Mines at Butte. Of the

only three cities have over 10,000 inhabitants,—Butte (30,470), Great Falls (14,930), and Helena (10,770), the capital. Pop. (1880) 39,159; (1890) 132,159; (1900) 243,929, including 10,740 Yankees. Territory-wise there was no region on the continent more frequent: in 1876 General Custer (q.v.) and his command were all killed on the Little Big Horn by the Sioux.

Montanism., a heresy which grew up within the Christian church in the second half of the 2nd century; its founder was Montanus, a religious enthusiast who appeared at Ardeban in Phrygia in the year 156, with a mission to purify and re-organise the church. Christianity had now become adopted by men in all classes, and already it had to a great extent ceased to be what it was originally—a society of enthusiastic devotees shut off from the world. Ardeban held the church adapted to her use everything of value in the social and political arrangements of the world around her, and thus fitted herself for the rôle of a great world-religion. Side by side with this growing secularism there sprang up a natural reaction in favour of the old discipline. Ardeban was then so strong as in Phrygia, where it was linked with a belief in a new and final outpouring of the Spirit. Here there quickly formed themselves societies of spiritual Christians who gladly hailed the appearance of the "bracelet," and were gradually compelled to withdraw from the church, branded as Montanists and Kataphrygians. Montanus selected the small Phrygian towns of Pepua and Tynion as the Jerusalem of the church, and for twenty years his movement was limited to Phrygia and the surrounding districts. He himself enjoyed a continuance of the prophetic gift, as well as that of two women, Prisca and Maximilla; his most zealous missionaries were Alcibiades and Theodotus. The persecution that began after the year 177 spread the movement wider by deepening the earnestness of conviction held by those who had maintained their faith. In Phrygia they were sternly repressed by the bishop, and formally excommunicated; but elsewhere than in Asia Minor they did not at once leave the church, but formed small conventicles within it. In Gaul and Rome it was long held that communion should be maintained with them. But this separation became necessary, as the Montanists became stronger in their demand for a return to primitive discipline, for more fasting, the proliferation of second marriages, and a severer life generally. Denunciation and exclusion produced their natural effect in making them still more national, severe in their judgments, and arrogant in their asceticism. At Carthage a numerous body of Montanists had grown up, and from 202 to 207 they strove hard, but in vain, to remain within the church, but at length quitted it because it refused to recognise the new outpouring of the Spirit. It is true that the great Tertullian joined their ranks, having be- come profoundly convinced of the necessity for a return to primitive Christianity in order to heal the secularism of the church. Montanism sur- vived in the East, in the 4th and 5th centuries, but in the West it was over less aggressive, and did not grow up until the Catholic Church had firmly established its organisation. Therefore it never became more than a mere sect; and from a genuine desire for reform and truth, it had degenerated into an artificial strictness and mere legalism. Yet down to 400 A.D. there were still Tertullianists at Carthage.

See Ritschl's Entstehung der Altkatholischen Kirche (2d ed. 1867); De Soyes, Montantism and the Primitive Church (1876); Bonwetsch, Die Geschichte des Montanis-
he was severely wounded and made prisoner at the battle of Piacenza. In 1756 he assumed command of the French troops in Canada, and soon after his arrival captured the British post of Oswego. The succeeding summer he crossed Lake George with about 8000 French and Indians, and captured Fort William Henry. After the French had taken possession of the fort, the defenceless prisoners, comprising men, women, and children, were massacred by the Indians. Montcalm has been blamed even by his apologists for not foreseeing the danger, and taking effectual measures to avert it. In 1758 General Abercomby advanced on Monsegonwith 15,000 regulars and provincial troops. The place was defended by Montcalm with a much smaller force of regular troops. The British troops displayed heroic daring and courage, but after repeated attempts to force the defences, which were in themselves almost impregnable, and were defended with great gallantry, they withdrew with a loss of about two thousand men. This French success was, however, much more than counterbalanced by the loss of Louisburg and Fort Duquesne about the same time. Montcalm then removed to Quebec, and prepared to defend it against a British attack again. Of the 16,000 troops under his command the majority were militia and Indians. In 1759 General Wolfe ascended the St Lawrence with about 8000 troops, and a naval force under Admiral Saunders. After repeated attempts to scale the heights of Montmorency, and a severe repulse about the end of July, he surprised a French outpost before dawn on 13th September, scaled the heights with about 5000 men, gained the plateau of Quebec, and formed in line of battle on the Plains of Abraham. In the battle that ensued the French ultramontane and broken tableland of the city. Montcalm tried in vain to rally his force, and, having been borne back by the pressure of the retreat, he was mortally wounded at the St Louis gate, and died the following morning, 14th September 1759. See the Parkman's Montcalm, and Wolfe (Boston, 1884); and Falgairolle's Montcalm et la Footeurée (Paris, 1886).

Mont Cenis, or MONTE CENSIIO, an Alpine peak and pass between Savoy and Piedmont. Height of the mountain, 11,792 feet; of the pass, 6884 feet. Over the pass a road was constructed (1802-19) by Fabriani, under Napoleon's orders, at a cost of £80,000. The road lies in the valley of the Tanaro; the pass a railway tunnel, 71 miles long, was begun in 1857 on the Italian side, and in 1863 on the French, and was finished in 1870 at a cost of £3,000,000. Through this tunnel passes one of the main continental overland routes from London via Paris to Brindisi, for Asia, Australia, and East Africa.

Mont-de-Marsan, capital of the French department of Landes, at the confluence of the Midou and Douze, 92 miles by rail S. of Bordeaux. It has a mineral spring and manufactures of chemicals, iron, &c. Pop. (1872) 7441; (1891) 8790.

Mont de Piété, called in Italy MONTE DI PIETÀ, a charitable institution the object of which is to lend money to the poor at a moderate rate of interest. It was closely modelled on the ‘Monte,’ a precursor of the modern bank, in which the creditors, or the parties who supplied the capital, formed a close corporation, with privileged claims upon certain sources of income. These conditions were designed to avoid the laws against usury. But the Monte di Pieta did not at first levy regular interest, only a small percentage to cover the expenses of administration. The earliest of these institutions was established at Orvieto in 1463; and another followed at Perugia, 1617; yet the right to levy for the expenses of management was only conceded in 1315. The system was introduced in Spain, France, Belgium, Germany, the Netherlands, and Mexico. There exists at Paris a national pawnbroking establishment, called Mont de Piété, which charges 9 per cent. on all loans to pay the working expenses. The funds of the Monte di Piétà are placed at public charity funds. See Blaise, Des Monts de Piété (2 vols. 1856), and PAWNBROKING.

Mont-Borees-Bains, a village of Auvergne, in the department of Puy de Dôme, 36 miles SSW. of Clermont-Ferrand. It lies 3412 feet above the sea-level, in a picturesque valley, through which the river Ardeche rolls on both sides by rugged volcanic hills, and closed towards the south by a semicircle of jagged mountains, the highest point of which, the Pic de Sauzy (6188 feet), is the loftiest mountain in central France. The Mont Dore mineral springs, which were used by the Romans, are of great value in affections of the throat and most diseases of the respiratory organs, as also in the earlier stages of rhenannism. There are eight powerful springs in full operation, seven of these having a temperature which varies between 102° and 114°, while La Source Sainte Marguerite, at an altitude of 8000 feet, contains bicarbonates of soda, iron, and arsenic. The ordinary population of the village is about 1400, but the baths, which are every year becoming better known, are thronged during the short season (July to September) with visitors from all parts.

Montebello Casteggio, a village of Northern Italy, 14 miles S. by W. of Pavia, where the Austrians were defeated by a French army under General Lannes (afterwards Duke of Montebello), after a desperate conflict, 9th June 1800. In May 1829 the Austrians were again defeated here by the united French and Piedmontese army.

Mont Carlo, a small town in the territory of Monaco (v. x.), 1 mile S.E. of the town of Monaco, notorious on account of its gaming-tables, and the numerous suicides of ruined gamblers.

Monte-Casino, the monastery built (529) by St Benedict, founder of the great Benedictine order, stands on beetle cliffs, in a magnificent situation, 70 miles by rail NW. of Naples and 92 S.E. of Rome. It has been completely destroyed by a fire in 1550 by the Longobards, in 884 by the Saracens, in 1030 by the Normans, and in 1349 by an earthquake. It was dissolved in 1866; but a few monks still remain. In 1313 the abbot was elevated to episcopal rank, and from 1594 he was official ‘head of all the abbots of the Benedictine order.’ The existing church, replacing one erected in 1066, was built in 1279, and possesses an 11th-century Byzantine bronze portal, mosaics, frescoes, carvings, &c. The former monastic buildings contain valuable archives, a picture-gallery, a library of 40,000 volumes, 30,000 charts, 500 incunabula, and a seminary. See Testi, Storia della Badia di Monte Cassino (1843), Archivio Cassinese (1847), and Mackey’s Life of Bishop Forbes (1888).

Monte Cattini, a watering-place of Italy, by rail 30 miles NW. of Florence and 19 E. of Lucca. Its mineral springs are saline, range between 82° and 96° F., and are efficacious for abdominal complaints, some violent dysenteries lasting from May to September. Near here the Florentines were defeated by the Pisans in 1315.

Monte Cristo, an uninhabited islet of granite off the Italian coast, 26 miles S. of Elba. For the novel whose hero bears this name, see Dumas.

Montecuulli, RAIMONDO, COUNT, was born at Modena in 1608, and entered the Austrian service, distinguishing himself during the Thirty Years’ War (especially at Breitenfeld and Nödlingen), in
Montenegró

a campaign against the Turks (1604), and against the French under Turenne on the Rhone (1672-75).

He was made a Prince of the Empire and Duke of Melhi, and died at Linz, 16th October 1681. A second edition of his Operi Complete appeared in 1623; there is a Life by Cam porri (1876).

Montefiore, Sir Moses, a Jewish philanthropist, was born at Leghorn, 1846. His father was born in Venice and was a merchant. He had received a thorough Jewish education, his parents having emigrated from Leghorn to London in 1879. In 1812 he married Judith Cohen (1784-1862), a lady who went hand in hand with him in all his philanthropies; and for a time, in memory of his accomplished wife, he soon achieved great success. In 1815 he was elected president of the Spanish and Portuguese community. From 1829 onwards he took a prominent part in the struggle for removing the civil disabilities of English Jews (see JEWS). In 1835 he was one of the parties to the contract for the £15,000,000 given as compensation to the slave-owners. He was for a time High Sheriff of Kent, and, after long exclusion and repeated re-election, was legally admitted as Sheriff of London in 1837. In that year he was knighted, and in 1846 was raised to a baronetcy in recognition of his meritorious public services. He distinguished himself by his practical sympathy with his oppressed countrymen in various parts of the East, chiefly in Poland, Russia, Roumania, and Damascus. He made seven journeys to the East, the first being in 1827 and the latest in 1874, chiefly for the amelioration of the condition of his countrymen. At Bucharest, during an anti-Jewish ferment, he boldly faced the mob at the risk of his life. He was presented with the freedom of the City of London in 1873, and an address in 1883. In memory of his wife he endowed a Jewish college at Ramsgate in 1865. In his hundredth year he was still hale and well, but died 29th July 1885. See Diaries of Sir Moses and Lady Montefiore (2 vols. 1890).

Montego Bay, a port on the north coast of Jamaica (q.v.).

Montégut, Émile, a clever French critic, was born at Limoges, June 24, 1826, and early made a reputation for his critical essays on English and French literature. He contributed to the Revue des Deux Mondes and other journals, and published books of travel, a study of Marshal Davout, and translations of Shakespeare, Macaulay, and Emerson, and a work on the Duke and Duchess of Newcastle. He died 18th December 1893. Books of exceptional value are Poètes et Artistes de l'Italie (1881); Types Littéraires, et Fantaisies Esthétiques (1882); Essai sur la Littérature Anglaise (1883); Nous Morts contemporains; Les Écorvins modernes de l'Angleterre (2 vols.); Livres et Ames des Pays d'Orient; Mélanges critiques; and Dramaturges et Romanciers (1890).

Montélimar, a town in the French department of Drôme, near the Rhone, 85 miles S. of Lyons by rail, with some manufactures of silk, hats, and morocco leather. Pop. (1891) 9136.

Montem. See Eton.

Montenegro. See Cetinje.

Montenegro (the Italian translation of the native name Cernogora, 'Black Mountain'), an independent kingdom in the Balkan Peninsula, between Herzegovina and Albania, about 50 miles long by 70 broad. Its area was extended in 1878 by the addition of a large district on the north, a long narrow strip right down its east side to Lake Scutari, and the port and district of Antivari on the south of the latter. In 1889 by the addition of the port and district of Dulegino, also on the Adriatic. The area, thus extended, is officially quoted as 3235 sq. m.—a private estimate is 3486 sq. m.—considerably less than half the size of Wales. Beyond the low coastal fringe, which has a climate like that of the south of France, comes a rugged mountain-region ranging up to 6500-5000 feet, not in a series of chains, but in a confusing maze of peaks and gigantic clefts and blocks, wild crags and rounded masses and natural caves, the bare gray crystalline rock being everywhere visible. In this region the streams in some cases have underground channels, and even pass for miles beneath the mountains. The centre of the country is occupied by the branching valleys of the rivers Sutari, which flows into Lake Scutari, and Sutari, East and north of them the mountains are well wooded, principally with beech and pine, and afford good pasturage to the sheep, goats, and cattle of the people. The climate in these mountainous regions is characterised by temperate heat in summer and a rigid winter. Comparatively little of the surface is cultivated, except in the coast region; it is too sterile. Yet agriculture is the principal occupation of the people: of industry there is virtually none. All the farms are small, the fields of the largest not exceeding 10 acres. Corn is grown on the shores of Lake Scutari; and the mulberry is cultivated for silk-worms. The same lake, and some of the rivers flowing into it, yield an abundance of fish, especially of scombritza or bleak. The exports, consisting chiefly of cattle, goats, hides, sail-cloth, fish, wool, honey, saffron, fruits, and wine, reach the annual value of £200,000. The imports, for the most part wheat, gunpowder, hardware, groceries, cloth, and glass, average in value about one-tenth of the exports. Nearly all the trade is in the hands of the Austrrians. Accessible roads connect the chief towns or villages in the south; bridle-paths and footpaths only exist in the rest of the country.

The Montenegrins, a race of primitive mountaineers, who have lived in the same small district for generations been to fight the Turks, are a brave, warlike, and simple people, noted for their honesty and their chastity. The men are stalwart and handsome, but the women, who until recent years did all the hard work whilst the men fought, or idled, or hunted, are generally tall and lose none of their good looks. The people live in small stone houses, in small villages—there is not a town, strictly so called, in all Montenegro. They belong to the Servian branch of the Slavs, number (1891) 238,000, and belong, except about 10,000 Mohammedans and 4000 Roman Catholics, to the Greek Orthodox Church, the head of which is the emperor of Russia. The native head of the church is the Archbishop of Cetinje. The monastery of Ostrog is visited by large numbers of pilgrims every year. There is a Roman Catholic archbishop at Antivari. In the 14th century the country, known as the principality of Zeta, was tributary to the Servian empire; but, when the latter was subjugated by the Turks (1389), Zeta, assisted by fugitive Servians, successfully maintained its independence. From that time until 1859 the Montenegrins have waged almost incessant war against their hereditary foes, the Turks. In 1516, when the last prince of the second native dynasty abdicated his throne, the people elected their bishop to be ruler over them; and their first bishop was granted by election the title of prince (vladikas) down to 1851, when Danilo I. of the Nyegnsh clan, and nephew of the last vladika, persuaded the people to separate the civil from the
eclesiastical functions, and to elect him their secular prince, and declare the throne hereditary in his family. The prince is an absolute sovereign; he is elected by a Diet, and has a ministry of six members. The government both of the country and of the family is really, however, patriarchal, the will of the prince deciding all things only in so far as it does not conflict with the will of the people. During the last quarter of the 19th century it has been impossible to improve the civilisation; education has made rapid strides, the men have taken to cultivating their fields, and roads have been constructed; while the old militia has been converted into a standing army of 30,000 men, though not more than 100 serve permanently, as a bodyguard to the prince. An arms-factory has been established at Rieka and ammunition-factories at Rieka and Cetinje. The last-named village is the capital. The empress of Russia supports a higher school for girls at Cetinje. Crime is almost unknown. Podgoritzá and Rieka are the chief trading-places. The state income amounts to about $500,000 per annum, a portion of which is a subsidy from Russia (since 1856); the expenditure is not known. There is a state debt of $100,000 owing to Austria and $20,000 owing to Russia. Montenegro has no money of her own; she has only paper money. The Turkish state finances are a sham. The vladika Peter II. (1830–51) is accounted one of the greatest poets who have written in Servian. In their patriotic songs and ballads the Montenegrins possess a treasure of great value, and of great influence upon the national temperament. The first Slavonic books to be printed were issued from presses at Cetinje and Rieka in the end of the 15th century. In 1835 a daughter of the prince was married to the crown-prince of Italy.

Montenotte, a small village of Northern Italy, 26 miles W. of Genoa, where Napoleon won his first victory over the Austrians, on 12th April 1796.

Montepulciano, a town of Italy, a bishop’s see, situated on a high hill, 43 miles by rail SE. of Siena, and girdled by walls. Its chief landmark is the Palazzo della Signoria and Bargellino, and is famous for its red wine. Pop. 2062.

Monte Carlo, a town in the French department of Seine-et-Marne, at the confluence of the Seine and Yonne, 49 miles SE. of Paris. At the bridge here, in 1414, Jean-sans-Peur, Duke of Burgundy, was assassinated in the presence of the young Dauphin, afterwards Charles VII., and in the immediate vicinity Napoleon, on February 18, 1814, gained his last victory over the allies. Pop. 7619.

Monterey, capital of the Mexican state of Nuevo Leon, lies in a fertile plateau-valley, by rail 670 miles N. of Mexico city. It is a well-built town, with a thriving trade, and contains a cathedral, seminary, and schools of law and medicine. It was founded in 1590. It was taken by General Taylor in 1846.

Monte Rosa, an Alpine mountain mass with four principal peaks, in the Pennine ridge which separates the Swiss canton of Valais from Italy. The highest peak, the Dufourspitze, 15,217 feet high, is extremely difficult of ascent, and was first climbed in 1856. It was climbed again in 1883.

Monte Saut’ Angelo, a city of Southern Italy, 28 miles SE. of Foggia. It stands 2700 feet above sea-level, on one of the Gargano hills, and is famed for its exquisite honey. Pop. 15,109.

Monte Sarchio, a town of Southern Italy, 13 miles NW. of Avellino. Pop. 5238.

Montespan, FRANÇOISE ATHÉNAIS, MARQUISE DE, mistress of Louis XIV., was born in 1641, the daughter of Gabriel de Rochecourant, of the family de Montereau, and married in 1663 to Marquis de Montespan, and became attached to the household of the queen. Her beauty and wit captivated the heart of the king, and about 1668 she became his mistress, without, however, as yet supplanting La Vallière. The marquis was flung into the Bastille the next year, and died there finally in 1670; his marriage was formally annulled. Montespan reigned till 1682, and bore the king eight children, which were legitimised, but at last her influence paled before the rising star of the astute widow of Sceaux, afterwards Madame de Maintenon. Montespan died in 1699, and was succeeded in her children. Gradually she lost all hold over the king, and in 1687 left the court, in 1691 Paris itself. Later, like so many women of her class, she found relief in devotion, and died 27th May 1707. See her Mémoires (1828; trans. 1835), and the studies by A. Houssoy (10th ed. 1864) and Clément (1880).

Montesquieu, CHARLES DE SECONDAT, BARON DE LA BRÈDE ET DE, a celebrated French writer on politics and law, was born 15th January 1689, at the château La Brède, near Bordeaux. Jacques de Secondat, the father of the future author, was second son of the Baron de Montesquieu, president and chief judge of the chamber of the Pyrenees, and Charles-Louis de la Brède, as Montesquieu was called, after studying the ancient classics, philosophy, and law, became councilor of the parliament of Bordeaux in 1714, and its president in 1716, succeeding his uncle, who left him all his property. He was a profound student of Oriental law, and to the title of Montesquieu. The young president discharged the duties of his office faithfully, but he gave himself by preference to the study of nature under the influence of Newton. In his discourses before the Academy of Sciences of Bordeaux he dealt with the causes of echoes and of the weight and transparency of bodies, and with the use of the renal glands, and sketched a project of a physical history of the earth (Discours Académiques, 1716–21). But defective vision compelled him to abandon experimental research. His first great literary success was the promotion of the new title of Persanes in 1721. These contain a satirical description of the contemporary manners, customs, and institutions of society in France, and owed much of their popularity to the ingenuity of their form and the quipancy of their style. The Persians, like the Turks, were a people of great importance to France, being a people from Asia to Paris, and exchanging their impressions by letters to each other, as well as corresponding with their friends at home. The idea was borrowed from Dufresny, and it has been frequently imitated since. The liberality of the political decadence, and the irre seq uisiter of the first years of the regency that followed the death of Louis XIV. are limned with masterly art. For his delineations of Persian manners and institutions he drew from the accounts of Sir John Chardin and other travellers. He travelled a lot at times wantonly sensuous, imagination created most of his situations and characters. Along with much that is frivolous and ephemeral, the Persian Letters contain solid reflections on the nature and relations of social institutions, and an admirable exposure of the author’s own views on government, tolerance, and the influence of climate on population, customs, and religion. In 1725 Montesquieu wrote and published anonymously at Paris a prose poem entitled Le Temple de Gide, in the artificial French style of the time. Returning to Bordeaux, he read the Académie a translation of duty from the Stoic standpoint, and delivered an admirable discourse on the motives which ought to give

MONTELLEÓN

MONTELLO

MONTELLO

MONTELLO
MONTEVIDEO

encouragement in the sciences (1725). Eager for larger observation and enjoyment of the life of society, and weary of the routine of his parliamentary duty, he sold his office in 1726, and then settled in Paris. Thereafter he travelled for three years in order to observe and study the people and manners of the greatest nations. He visited Vienna, where he studied the constitutions of Hungary and Poland; Venice, where he formed a close friendship with Lord Chesterfield; and Rome, where he studied Italian art, and was favorably impressed by then-passed by Switzerland and the Rhine to Holland, where he again met Chesterfield, who took him to England. He remained in England from October 1729 to August 1731, mixing with its best society, frequenting the Houses of Parliament, studying the political writings of Locke, and analyzing the organization and working of the English constitution, whose essential principles he may be said to have discovered. After returning to France he divided his time between Paris and La Brede, mingling the pursuit of pleasure and an uncultivated mixture with the political importance of his great works on the science of politics and law. His Considerations sur les Causes de la Grandeur des Romains et de leur Décadence, the ablest, if not the most important, of his works, appeared in 1734. In it he surveys the vast political development of ancient Rome from the first beginning of the Eternal City till the Turks gathered around the walls of Constantinople, and his elucidation of the causes that determined the character and detail of the movement may—be regarded as the first genuine application of the modern scientific spirit to history, and as an epoch-making contribution to its philosophy. His characterizations of the great Romans, his analysis of complex influences, his filtration of events, his estimates of political and social causation have been generally accepted and rephrased by subsequent historians. His great monumental work on the spirit of laws, De L'Esprit des Lois, appeared in 1748 in 2 vols. at Geneva. It was the product of all the work of his life, and of the deliberate and concentrated effort of twenty years. Although published anonymously, and put on the Index, the work passed through twenty-two editions in less than two years; and it soon vindicated its claim to be the most original and popular book ever published on the science of law. Montesquieu indicated his consciousness of its originality by prefacing it the epigraph: Prolece sine matre creatum. French Jurists of the 16th century, Cujas and others, had led the way to the historical treatment of Roman law, and Domat had written a chapter on 'the nature and spirit of laws,' but the universalization of the historical and comparative method in dealing with the reason and relations of all laws is Montesquieu's own, and he applies it more lucidly, and also more widely than Vico did. By the spirit of laws he means their raison d'être in time, their historical causation and universalization, and the conditions by which their origin, development, and forms are determined. The discussion of the influence of climate was the most characteristic element of the work; it advances beyond the old abstract discussions of right and, although pushed in some points too exclusively, it led to the method of the recent work of the positive and ethnological school. The analysis of the forms and principles of government carried the subject farther than had been done by any one since Aristotle; and the exposition of constitutional history, with its clear distinction of the legislative and executive powers, made an advance upon Locke, and held up the free English constitution to the admiration and imitation of all Europe. The influence of Montesquieu's great work upon political and legal thought directly, and upon government and laws indirectly, was immense. It came too late to save France from the political errors that culminated in the Revolution, but it inspired and guided its best political thinkers and writers. In 1750 he published a clever Défense de l'Esprit des Lois, followed afterwards by Lysimaque (1748), a striking dialogue on despotism, Avis aux Étrangers, a romance, and an essay on taste in the Encyclopédie. Severe critics had charged his style as a substitute for weakened his eyes till he became totally blind. He died at Paris 10th February 1755, aged sixty-six, in the calm enjoyment of his great reputation. The best edition of Montesquieu's works is that of E. Laboulaye (7 vols. Paris, 1875-79); that of Lahure (3 vols. 1886) is convenient and serviceable. They are in English and other translations of the Lettres Persanes, and a commentary by Meyer (1841). The Spirit of Laws was soon translated into English by T. Nugent (new ed. by Prichard, with D'Alembert's Analysis, 2 vols. Bohn, 1878). Vian's Histoire de Montesquieu, sa Vie et ses Œuvres (24 ed. 1879) is the fullest biography and bibliography. The smaller monograph by A. Sorel, Eng. ed. by Taylor, 1887; Excellent; that by Zavott (1887) may also be mentioned.

Montevideo. Claudio, composer and harmonist (1568-1643). See HARMONY, MUSIC.

Montevideo, the capital of the republic of Uruguay, is situated on the north shore of the La Plata estuary, about 125 miles E. by S. of Buenos Ayres. It was built originally on a low promontory between the ocean and a horseshoe-shaped bay, 2 miles in circumference, but later has been stretched far into the flat country behind, and have crept round the bay to the landmark which gives the city its name—the Cerro, a smooth, isolated cone, 505 feet high, crowned with a lighthouse and an old fort. At its base there are nearly a score of great salteater, or salt-salting establishments, where 200,000 cattle yearly are killed; and here, too, is the largest of the city's dry-lands. The city proper covers an area of about 5 square miles, the old town, on the little peninsula occupying nearly one square mile; and the sea-breezes make its climate both pleasant and healthy. Montevideo is an attractive town, with broad streets exceptionally well paved—Mulhall declares the Calle 18 de Julio, which is 85 feet wide, 'incomparably the finest street in South America.' The houses are flat-roofed, mostly two or three storeys high, and often crowned with small square belvederes. High above these rises the cathedral (133 feet), with two side towers and a dome covered with green and blue and yellow tiles. The next most prominent building is the large opera-house; and others are the town-hall, the custom-house, the exchange, the Cabildo (law-courts and parliament house), the school of arts and trades, the university, the museum, the English and Basque churches, two convents, the Hospital de Caridad (330 beds) and the British hospital (50 beds), the extensive public markets, and several of the banks and hotels. Tramcars run in all directions—there are over 55 miles of lines; there are local electric lighting and telephone companies, and a submarine telephone to Buenos Ayres; and water is brought by a pumping-main from the river Santa Lucía, a distance of 34 miles.

The depth of water in the bay ranges from 9 to 15 feet, and vessels of heavy draught are compelled to anchor in the roadstead outside, which is exposed and often very rough. If a proper port had been provided at this early date, the carrying trade of the Buenos Ayres trade was diverted by the Paraguayan war, Montevideo might have permanently taken the place now occupied by the Argentine
MONTEZ

Montez, Lola, adventuress, was born in 1818 at Limerick, and was christened Marie Dolores Eliza Rosanna, her father being an Ensign Gilbert, her mother of Spanish descent. Taken out to India, she there lost her father by cholera; and, her mother having remarried, Dolores (or 'Lola') was sent home in 1826 to England, and brought up at first at Paris, and at last. To escape the match, arranged by her mother, with a gouty old judge, she eloped with a Captain James, whom in July 1837 she married at Neath; but the marriage ended in a separation and in her return to England (1842). She now turned dancer, coming out at Her Majesty's Theatre; and after visits to Dresden, Berlin, Warsaw, St Petersburg, and Paris (where she formed a liaison with Dujarrier, a young Republican editor, who fell in a duel), she came towards the close of 1846 to Munich. There she soon won an ascendency over the eccentric artist-king, Louis I, who created her Countess of Landsfeld, and allowed her £5000 a year. For more than a twelvemonth she was all-powerful, her power directed in favour of Liberalism and against the Jesuits; but the revolution of 1848 sent her straight off to Paris. Again she married (this time a Lieutenant Heald), a marriage as unlucky as the first; and, after touring (1851–56) through the States and Australia, and after two more 'marriages' in California, in 1858 she delivered in New York a series of lectures written for her by C. Channey Barr. She died, a penitent, at Ashton, Long Island, on 17th January 1861, her last four months devoted to ministering in a Magdalene asylum near New York, and was buried in Greenwood Cemetery. See her Autobiography (1858), and The Story of a Penitent (1867).

Montezuma, the name of two of the emperors of Mexico. Montezuma I, the most able of the Mexican emperors, ascended the throne about 1437, and soon after commenced a war with the neighbouring monarch of Chalco, which resulted in the annexation of that kingdom to Mexico. He next entered a confederacy of the Tascalans, and reigned safely till his death in 1471. Montezuma II, the last of the Mexican emperors, succeeded to the throne. Adorned with the titles of a warrior, henceforth he devoted his chief attention to the improvement of the laws, and indulged his taste for pomp and luxury at the cost of heavy taxation, leading to frequent revolts among his subjects. When Cortes landed in Mexico with his small army in 1519, Montezuma was at the height of his power, and he gave the Spaniards every assistance, without attempting to prevent the conqueror's progress to his capital. Soon he himself was practically a prisoner in the Spanish camp, and when the citizens rose in revolt Cortes brought out Montezuma in order to pacify them; but he was killed by his own subjects, from amongst the crowd of his own subjects proved a climax to all the indignities he had suffered. He repeatedly tore the bandages from his wound, and soon after died broken-hearted, June 29, 1520. Some of his children adopted the Christian religion, and his son Agustín, married to Charles V, the title of Count of Montezuma. One of his descendants was viceroy of Mexico from 1697 to 1701. His last descendant, Don Marsilio de Ternel, Count of Montezuma, was banished from Spain by Ferdinand VII., and afterwards from Mexico, on account of June 1239, and died at New Orleans in 1836. See Cortes.

Monteferrat, formerly an independent duchy of Italy, between Piamont, Milan, and Genoa, now forming part of the kingdom of Italy. It consisted of two separate portions, both lying between the Maritime Alps and the Po, and having a united origin on the latter river. The first was the Duchy; after the downfall of the Frankish empire, Monteferrat was ruled by its own marquises till the beginning of the 14th century. This house sent its most illustrious sons to take part in the Crusades, especially Conrad, the defender of Tyre against Saladin, and the first defender of Jerusalem for the kings of Jerusalem; and Boniface, who became ruler of Thessalina. Iolanda or Irene, sister and heiress of the last male of the house, was empress of Constantinople; her second son became the founder of the family of Monteferrat-Paleologus, which became ducal in 1553, and Monteferrat passed to the Gonzagas of Mantua. In 1631 the Dukes of Savoy obtained a portion of Monteferrat, and in 1703 the remaining portion.

Montfort, L'Amauri, the name of a noble French house, traditionally descended from a marriage (end of 10th century) between the heiress of Montfort and Epernon and William of Hunault, great-grandson of Baldwin, Count of Flanders, and the third husband of Judith, daughter of Charles the Bald. The name was taken from the castle of Montfort between Paris and Chartres. Its most famous members were the great Simon de Montfort and his father, Simon IV. Comte de Montfort and Arle de Toulouse, the husband of Judith, subsequently the ruthless persecutor of the Albigenses. He was born about the year 1120, went on a fruitless crusade to Palestine, but began about 1208 the more congenial crusade of extermination against the heretical heretics in the south of France. He was killed by a stone at the siege of Toulouse, 23rd June 1218. See ALBIGenses.

Montfort, Simon de, Earl of Leicester, the fourth son of the preceding, and of Alice de Montmorency, was born about the beginning of the 13th century. The title of Earl of Leicester came to him by his grandmother, Amicia de Beaumont, sister and co-heiress of Robert, Earl of Leicester; and in 1228 we find him in England, where he was well received by Henry III., and confirmed in his title and estates two years later. He married in 1228 the king's youngest sister Eleanor, who had been betrothed to the Earl of Pembroke, and who, in the grief of an enthusiastic girl of 17, had refused to marry a youth she had taken in her haste a vow of perpetual chastity, but never proceeded to take the veil. The marriage aroused the jealousy of the barons and the demureness of the church, whereupon Simon repaired to Rome, and there succeeded by gold in obtaining the pope's licence. In 1231 he was grafted at the baptism of Prince Edward, but three months later

MONTPELIER

The Jews, Arumians, and Turks still reckon by the lunar months of 29 and 30 days, and are therefore compelled, like the ancient Greeks, to insert an intercalary or 'embolismic' month. The French republicans in 1793 divided the year into twelve months of 30 days, with five odd days (six in leap year) to be utilised as national festivals each month, being subdivided into three decades of 10 days each, as with the ancient Greeks. Another distribution of the months has since been suggested, should such opportunity again occur—viz.: 1st, 3d, 5th, 7th, 9th, 11th months, each 30 days; 2d, 4th, 6th, 8th, 10th, 12th months, each 29 days; and the remaining month 30 days in the ordinary year and 31 in leap year. The existing 'calendar' or 'civil' months are as irregular in length as they were left by the Romans: the 4th, 6th, 9th, and 11th having 30 days, the second 28 days (or 29 in leap year), and the seven others 31 days. To complicate this disorder, a month in English law is 'a lunar month or 28 days unless otherwise expressed; 'a lease for twelve months is only for 48 weeks' (Blackstone, ii. 141).

Montcalm, CHARLES TRISTAN DE, Count of Lee, was born at Puy 1752. Having served in the navy, he entered the army, and was severely wounded at Wagram. Napoleon made him his chamberlain in 1802. During the Hundred Days Montcalm was Napoleon's adjutant-general. He accompanied his master to St Helens, and along with him published Mémoires pour servir à l'Histoire de France sous Napoléon (8 vols. 1822-25). As chief of the staff to Louis Napoleon in 1840, he was condemned to twenty years' imprisonment; he regained his freedom in 1848, having published in 1846 Récits de la Campagne de Napoléon (2 vols.).

Montcalm. See MONTOLON.

Monti, VINCENZO (1753-1828), an Italian poet of the classical school, politically anti-French, Napoleonist, pro-Austrian in turn. He was professor at Pavia, and, under Napoleon, state historiographer.

Montpelier, a town of Spain, 28 miles S. of Cordova by rail. Pop. 15,283.

Montrose, Sep PARIS.

Montcuyé, a town and fortress in the French department of Mese, 23 miles N. of Verdun and 31 miles by rail. SE. of Sedan, consists of two portions, the citadel and upper town overlooking the lower town, which lies in the valley of the Bienlein, an affluent of the Moselle. Built and fortified in 1235, it was taken by the French in 1542, 1555, 1596, and 1637; they, after it was definitely assigned to them by the peace of the Pyrenees (1659), had it reconstructed and re-fortified by Vauban. It was, however, captured by the Germans in 1815 and again in 1914, Pop. 2,740.

Montmory, a river of Quebec, a tributary of the St Lawrence, famous for its beautiful falls, 8 miles NE. of Quebec. Here the stream is 100 feet wide, and the falls have a sheer descent of 250 feet.

Montmorency, ANNE, first Duc DE, Marshal and Constable of France, born 15th March 1492, belonged to one of the oldest and greatest noble families of France. Brought up along with Francis I, he distinguished himself by his gallantry and military skill at Marignano (1515) and in the defence of Mâcon, and was taken prisoner along with his sovereign in the battle of Pavia (1525). In consequence of his efficacy of arm, and his successful warring against the emperor's armies, he was made Constable in 1538; but, being suspected by the king of siding with the Dauphin against him, he was banished from court in 1541. On the accession of Henry II. (1547) he was restored to his former position and dignities. In 1557 he commanded the French army which suffered the terrible defeat of St Quentin at the hands of the Spaniards, in which he was again taken prisoner. During the minority of Charles IX., Montmorency, with the Duke of Guise and the Marquis St André, composed the triumvirate which opposed the influence of Catharine de' Medici. In 1562 he commanded the royal army against the Huguenots at Dreux, and was taken prisoner a third time. In the following year he drove the English out of Havre. He again commanded at St Denis in 1567, but received a fatal wound, of which he died at Paris on the following day, 11th November 1567. See Life by Dequier (2 vols. Paris, 1885-89).

Montmorency, HENRI, second Duc DE, grandson of the famous Constable de Montmorency, was born at Chantilly, 30th April 1521, and was Henry II. 's whole life always called him his 'son.' When he was seventeen years of age Louis XIII. made him admiral and viceroys of Canada, and in the following year governor of Languedoc. During the religious wars of 1621 and the following years Montmorency commanded the Catholics in the south against Rohan, was almost captured at the siege of Montpellier (1622), took the islands of Ré and Oleron from the defenders of Rochelle and La Rochelle, and penetrated into Piedmont (1638). But Riehen, jealous of his popularity, desired his head, which was refused him by his brother, Gaston, Duke of Orleans. Marshal Schomburg was sent against him, defeated him at Castelnaudary, and took him prisoner. Montmorency, covered with wounds, was carried to Toulouse, sentenced to death by the parliament, and sent through the procession to King Charles I. of England, the pope, the Venetian Republic, and the Duke of Savoy, was beheaded, 30th October 1632. Montmorency was distinguished for his amiability and the courtesy of his manners, as well as for his valour in battle.

Montoro, a town of Spain, on the Guadal-quivir, 26 miles E.N.E. of Cordova. Pop. 13,293.

Montpellier, the capital of Vermont since 1805, is on the Winnoski or Onion River, 206 miles by
Montpellier, the capital of the French department of the Hérault, on the river Lez, 6 miles from the sea and 31 SW. of Nimes. Pop. (1872) 54,466; (1891) 92,258. Lying near the centre of Langue-doc, on the great route from Italy and Provence to Spain, with its seaport at a point offering the shortest land-route not only to all parts of Langue-doc, but to the whole of France, Montpellier's position was as highly favourable one during the middle ages. Hence alike its commercial and intellectual importance, and its stormy history, during which it was sometimes independent, and sometimes under the suzerainty of Aragon, France, or Navarre, before finally becoming a possession of the French crown in 1392. Its schools of medicine, law, and arts, developing during the 12th and 13th centuries, were formally constituted a university by a papal bull in 1289, at which time the schools of law and medicine (the latter founded by Arabian physicians) rivalled those of Paris. In the following century, Petrarch was a student at the law school, and Arnaud de Villeneuve, the alchemist and physician, was teaching in the medical school. With such a geographical position Montpellier was easily stirred by the Renaissance. Baehrel, and Roure, both graduated in medicine in 1537; Casanova was made Greek professor in 1580. Around Metelet there is a continuity almost unique in the history of science. A pupil of his founded the famous botanic garden (the oldest in France) in 1589; other pupils, Lobel, Chaussier, the brothers Bauni, were highly distinguished amongst the earlier botanists (see BOTANY). At the end of the 17th century (during which Clarendon and Locke had been residents), Magnol again made Montpellier the centre of the science, and reckoned among his pupils Tournier and the elder De Jussieu. De Candolle also wrote here some of his principal works, and laid out the first botanic garden upon the natural system in 1810. The medical school had also a notable history; and a new period of activity is indicated by the celebration of the sixteenth century (1890), with its reorganisation upon the fullest scale of equipment. The town has also an important picture-gallery and library.

A centre of wine production, upon which its present prosperity depends, Montpellier suffered greatly by the phylloxera; but it was here that the cure of grafting French vines upon American stocks was earliest applied. The new School of Agriculture, chiefly devoted to the practical study of wine and silk culture, is very flourishing. Of the medieval town little remains, its fortifications and most of its buildings, save the cathedral and the adjoining bishop's palace (which now houses the school of medicine), having been destroyed in the religious wars, in the Revolution, or by municipal improvements. The older streets are crooked and narrow, but there is better shelter from the sun, and from the chilling mistral, than do the modern ones. The chief modern buildings are the theatre and law-courts; but the principal glory of the town is its two great terraces, forming public promenades overlooking the undulating country dotted with innumerable châteaux or country seats, and from the distance the Mediterranean, Cevennes, Pyrenees, and Alps. See Duval Jouye, Montpellier; Aigrefeuille, Histoire de Montpellier (1739; new ed. 1877).

Montreal, the largest city of the Dominion of Canada, is the centre of Canadian commerce, of Canadian banking, and of the extensive system of railways by which the country is now covered. It is built on the south-east side of an island formed by the junction of the Ottawa River with the St. Lawrence, and may be said in general terms to be situated on the northern bank of the St. Lawrence.

The city is about 4 miles long and 2 wide, the Central Mountain rising in the rear narrowing the city at its base for some distance. It is not the political capital of the province, but exercises an immense political influence, and practically not only directs the political business of Quebec, but exerts also by means of its banks, its manufactures, and its great importing and distributing commercial houses a great influence on the public policy of the Federal Government. It is also the seat of the greatest universities, hospitals, convets, and seminaries in all Canada. Finally it is during the season of navigation—i.e. from May to November—the great maritime port of the Dominion, a dozen transatlantic steamship companies making it one of their headquarters; while a lake and river and coast navigation of great activity increases and diversifies the business of the city. It is nearly 1000 miles from Montreal to the ocean proper, and 250 to the first salt water. Pop. (1871) 107,225; (1891) 140,747, or with the suburbs, 155,297; (1891), including the growth of the greatest universities, hospitals, convets, and seminaries in all Canada. In 1881 the people were divided into 78,681 of French descent, 28,995 Irish, 16,407 English, and 12,531 Scotch, with a sprinkling of various other nationalities. The revenue of the city in 1888 was $2,065,411, and the expenditure $2,066,398.

The growth of the commerce of Montreal is very remarkable. In 1870 the imports amounted to $23,698,888 and the exports to $1,222,101. In 1889 the imports were $24,948,394 and the exports $28,052,613. The 1500 miles of the St. Lawrence River contribute to the growth of commerce and distribute largely the growth of import. The total of receipts of grain, flour, and meal at Montreal in 1890-95 amounted to about 20,000,000 bushels annually, the shipments of the same being some millions less. The annual tonnage of shipping from 350,000 tons in 1870 to 550,000 tons in 1890-95 (the American ships declining). For the great Victoria Railway Bridge across the St. Lawrence, see BRIDGE, vol. ii., p. 441; see also CANAL. The Federal Government having assumed the debt of the port in 1868 for deepening the channel, and the canal-tolls having been reduced to a minimum with a prospect of being entirely abolished in order to encourage a through trade, the future of the port of Montreal as a practically free port seems assured. The canal system which forms its outlet at Montreal is remarkable. By means of the canals Montreal is enabled to turn and handle

rail NW. of Boston. It contains a handsome granite state-house, with a statue of Ethan Allen, and has some mills and tanneries. Pop. (1900) 26,029.
the trade of Duluth and Fort William on Lake Superior, of Chicago and Milwaukee on Lake Michigan, Collingwood and Goderich on Lake Huron, Buffalo and Cleveland on Lake Erie, Hamilton, Toronto, Kingston, and Oswego on Lake Ontario. These canals afford a continuous course of water communication extending from the Straits of Belle Isle to Fort Arthur at the head of Lake Superior a distance of 900 miles and drains an aggregate length of the St Lawrence canals is 70 miles. Montreal is the headquarters of the Grand Trunk Railway, the Canadian Pacific Railway, the South-Eastern Railway, the Central Vermont Railway. These great roads are by means of various connections the whole railway-system of the United States and Canada, and the Canadian Pacific Railway has a through line from Montreal to Vancouver City in British Columbia, a distance of 2900 miles. In the boot and shoe manufacture over 3000 hands are employed, in clothing-factories over 2500, in tobacco-factories about 3000, in the breweries about 500; and in the workshops of the railways an army of men are employed. There are also, rubber-factories, sawmills, silk-factories, cotton-mills, &c. Since 1897 an electric railway has been constructed, and the Lacoline (q. v.) is available for lighting and for the endless variety of industries in Montreal requiring the use of power.

Of the Episcopal churches, Christ Church Cathedral, Toward's Town, and General Gogeous of 230 feet. The Catholic churches are numerous and some of them splendid: St Peter's Church is a repetition on a smaller scale of the church at Rome; Notre Dame has 10,000 people; St Patrick's is the church of the Irish Catholics. In the French province the French language. The Presbyterians have eight larger and several smaller churches, the Methodists have eleven, and other denominations also are well represented. In all there are seventy-four churches in the city. Education in Montreal is correspondingly important, and the province of Quebec. It is denominational in character, the vast majority of the schools being of course Roman Catholic. The Protestant schools are under the control of a special board. The schools or Catholic churches or Protestant schools. McGill University, which obtained its charter in 1821, has been an active establishment since 1852; over 1200 graduates claim it as Alma Mater. Laval University of Quebec has a branch at Montreal; the seminary of St Sulpice, founded in 1657, is a theological institution; there is also a preparatory school at Montreal, chartered in 1865, has an endowment and property amounting to over a quarter of a million of dollars; the Wesleyan Theological College was founded in 1875; and others in the Congregational Church, the Anglican Diocesan College, St Mary's College, founded in 1848 by the Jesuits, the academic hall of which holds 1200 people, and the pupils in attendance numbering about 350, the Jacques Cartier Normal School, under the control of the provincial government, the Christian Brothers' School at Toronto; and convicts of the congregation of Notre Dame, the schools and convicts of the Sacred Heart. McGill College has a library of 25,000 volumes, the Advocates' Library has 15,000 volumes, the Presbyterian College has a library of 10,000 volumes, the Montreal Institute, the Fraser Institute, and the Y.M.C.A. have also libraries of some value. There are about fifty papers published in the city, including six French and five English dailies, and ten French and eight English weeklies. The Quebec Gazette (1764) is the oldest newspaper in Canada; the Montreal Gazette (1778) is the next oldest, and is the leading journal still. There are musical, art, and historical associations also which maintain in Montreal a taste for art, literature, and science not common in colonial commercial cities. Among the chief philanthropic institutions are the General Hospital, costing $40,000 a year; the Protestant House of Industry, to which 20,000 people a year have access; the Montreal General Dispensary, aiding about 10,000 persons a year; the Grey Nuns' Hospital (1755), which is also a hospital; the Hôtel-Dieu (1844), with 350 beds, receiving over 3000 persons a year, and costing about $35,000 a year for maintenance.

Montreal, a group of villages on the north shore of the Lake of Geneva, 15 miles by rail SE. of Lausanne. The name properly belongs to one small hamlet, but is popularly extended so as to include the adjoining villages of Cluses, Verron, Vertheaux, &c. The population is estimated at 20,000, of which about 10,000 are foreigners. It is a beautiful situation and mild climate of 'the Swiss Nice' attract many invalids to the place, which abounds with hotels and pensions. Near it is the castle of Chillon. See Steiger's Der Kurort Montreux (Zur. 1886).

Montrose, a seaport of Forfarshire, 76 miles NNE. of Edinburgh and 42 SSW. of Aberdeen. It stands on a level peninsula between Montrose Basin (a tidal loch, measuring 2 by 12 miles, but almost dry at low-water) and the mouth of the river South Esk. A fine suspension bridge (1829), 432 feet long, leads to Inchbrakocky or Rousie Island, in the Esk's channel, and he continued progress of educational advancement, and of growth in population.

Montreal, the birthplace of Robert Brown, botanist; Joseph Hume; Sir Alexander Barnes;
and Paul Chalmers, R.S.A. It has memories, too, of Edward I., the two Melvilles, the Great Marquis, the Old Pretender, Dr Johnson, and Lola Montez. A royal burgh since 1292 and earlier, it unites with Arbuthnot, Brechin, Forfar, and Montrose, to make a district. Pop. (1831) 15,238; (1841) 14,973; (1851) 13,048. See Mitchell's History of Montrose (Montrose, 1860).

Montrose, James Graham, Marquis of, belonged to a family which can be traced back to the year 1128, and which since 1225 had been settled at Old Montrose, in Maryton parish, Forfar, over which it had been ceded with the titles of Lord Graham (1431) and Earl of Montrose (1568); and three of its members had fallen at the battles of Falkirk, Flodden, and Pinkie; whilst another, Sir William Graham, early in the 15th century married for his second wife Mary, daughter of Robert III.—a marriage from which sprang the Graham of Claverhouse. John, third Earl of Montrose, was chancellor and, after James VI.'s accession to the English crown, vice-regent of Scotland. His successor, John, married Elizabeth Guise, a great-granddaughter of the fortunate Earl of Gowrie; and the issue of this union was five daughters and one son, James, the 'great marquis,' who was born in 1612 at Old Montrose. His mother died in 1618, his father in 1626. Next year the young earl was sent to the university of St Andrews by his guardian and brother-in-law, Archibald Lord Napiers, son of the famous inventor of logarithms. He was proficient in all field-sports, and an apt if not ardent student, besides exhibiting a genuine love of literature, which his stormy after-life never destroyed. In 1626 he married Elizabeth, a daughter of the last earl of Arran, whom he met in Edinburgh, and he was knighted at Kinmure Castle, his father-in-law's seat, till in 1633, on attaining his majority, he left Scotland to travel in Italy, France, and the Low Countries.

On his way home, in 1636, he had an audience with Charles I., but, owing to the machinations of the Marquis of Hamilton, was coldly received; and he had not been long back in Scotland before by the 'canniness of Rothes' he was 'brought in' to the ranks of the king's opponents, at this time comprising the great mass of the Scottish nation. Montrose, and his father, were in the fall of 1637 when the tumults broke out in Edinburgh on the attempt to introduce Laud's Prayer-book; and he was one of the four noblemen selected to compose the 'Table' of the nobility, which, along with the other Tables of the gentry, the burgs, and the ministers, drew up the famous National Covenant (q.v.). In the summer of 1638 he was despatched to Aberdeen, to censure it into subscription; and in 1639 he made three military expeditions thither. On the first occasion (30th March) he employed conciliation; Baillie lancts his 'too great' hand (25th May) he imposed on the city a fine of 10,000 merks, but, though his soldiers committed some acts of pillage, he resisted the importunities of the Covenanting zealots to give '人心' to the flames, and Baillie again complains of 'his too great lenity in sparing the enemy's houses.' The arrival at Aberdeen by sea of the Earl of Alwyn, Charles's lieutenant of the north, with reinforcements, caused Montrose to retreat, followed by the earl and the Gordon High-landers; but at Meagre Hill, near Stonehaven, on 15th June, he won a complete victory, and four days later received the surrender of Don. He was now one master of Aberdeen. The citizens expected some bloody punishment for their well-known Episcopalian leanings, but again Montrose generously disappointed their fears, again to be upbribed by the Committee of Estates for not having burned the town.

News now arrived of the pacification of Berwick, and terminated the struggle in the north. Charles invited several of the Covenanting nobles to meet him at Berwick. Among those who went was Montrose; and the Presbyterians dated what they regarded as their fortunes on the stage from his return. His political position was certainly different after his return. In the General Assembly which met in August 1639 he showed symptoms of disaffection towards the Covenant; and one night, it is said, a paper was affixed on his chamber-door, 'in locis non suis, in locis abstineatur.' The Scotch War, when, on 20th August 1640, 25,000 Scots crossed the Tweed, Montrose was the first to plunge into the stream; but that very month, with eighteen other nobles and gentlemen, he had entered into a secret engagement at Cum- bernand against the dictatorship of Argyll, to whom and the zealots Montrose was as hostile now as he ever had been to Hamilton and the 'sometime pretended pretates.' It leaked out that he had been secretly communicating with the king; and when the Scottish parliament met (November 1640) he was arrested and committed to Perth Castle.

The affair of the 'Cumbernauld Bond' was brought up; but nothing came of it, though some of the fiery spirits among the clergy 'pressed,' says Guthrie, 'that his life might go for it.' Next June Montrose with three others was accused of plotting against the king and confiding in the Duke of Richmond. Clarendon's story that Montrose, about this period, offered to the king to assassinate Argyll and Hamilton may safely be set aside; but to Hamilton he owed the rejection of his two proposals in the following year to raise the royal standard in Scotland and other parts.

In 1644, however, he quitted his forced inaction at Oxford, where he had been residing with Charles, and, disguised as a groom, made his way into Perthshire, with the rank of lieutenant-general in Scotland and the title of Marquis of Montrose. At Blair-Athole he met 1200 Scotch-Irish auxiliaries under Alaster Maccoll Keitshe Macdonell ('Col-kito'), and placed himself at their head, the clans quickly rallying round him. Marching south, on 1st September he fell on the Covenanting army, commanded by Lord Elcho, at Tippermuir, near Perth, and gained a complete victory. He then raised a force of Covenanters at Aberdeen (13th September), and took possession of the city, which was this time abandoned for four days to all the horrors of war. The approach of Argyll, at the head of 4000 men, compelled Montrose, whose forces were far inferior in men and horses, to retreat. He plunged into the wilds of Badenoch, recrossed the Grampians, and suddenly appeared in Angus, where he wasted the estates of more than one Covenanting noble. Having obtained fresh supplies, he once more returned to Aberdeenshire, with the view of raising the Gordons; narrowly escaped defeat at Fyvie in the end of October; and again withdrew into the fastnesses of the mountains. Argyll, baffled, returned to Edinburgh, and threw up his commission. However, receiving reinforcements from the Highland clans, planned a winter campaign, marched south-westward into the country of the Campbells, devastated it frightfully, drove Argyll himself from his castle at Inveraray, and then wheeled north intending to attack Inverness, 'Eschil.' Escaping out of Edinburgh, and, raising a fresh army, placed it under the command of a natural son of Sir William Baillie of Lamington. He arranged to proceed by way of Perth, and take Montrose in front, while Argyll should rally his vast army of vassals, and fall on him in the rear. The royal descent was to the Great Glen of Achn, the basin of the Caledonian
Canal, when he heard that Argyll was following him. He instantly turned on his pursuer and surprised and utterly routed him at Inverlochy, 25 February 1645. After the battle of the Campbells were slain, only four of Montrose's men. He then resumed his march northward, but did not venture to assault Inverness, his wild mountaineers being admirably fitted forrapid irregular warfare, but not for the slow work of besiegement. But directing his course to Montrose's north-east, he passed with fire and sword through Moray and Aberdeenshire. Baillie and Hurry, his lieutenant, were at Brechin, but Montrose by a dexterous movement eluded them, captured and pillaged Dundee (3d April), and escaped safely into the Grampians. On 4th May he routed Hurry at Auldearn, near Nairn, and on 2d July inlisted a still more disastrous defeat on Baillie himself at Alford in Aberdeenshire. 'Before the end of the summer,' he sent word to Charles, 'I shall be in a position to come to your Majesty's aid with a brave army,' and towards the end of the month he marched southward with upwards of 5000 men. He was followed by Baillie, who picked up reinforcements by the way, and who on 15th August again picked a battle at Kilbryth, but was defeated with fatal consequences. This was the last and most signal of Montrose's six splendid victories, seemed to lay Scotland at his feet, but the clansmen slipped away home to secure their beauty, and Aboney withdrew with all his cavalry. Still, with 500 horse and 1000 infantry, he had entered the Grampian country when, in September, he was surprised and hopelessly routed by 6000 troopers under David Leslie at Philiphaugh, near Selkirk. Escaping to Athole, he again endeavoured, but vainly, to raise the Highlands; and on 3d September 1646 he sailed for Norway, whence he proceeded to Paris, his ulterior object to invade England.

Here it was that news reached him of Charles I.'s execution, whereon he swooned, and then reviving, 'sware before God, angels, and men to dedicate the remainder of his life to the avenging the death of the martyr.' So, on behalf of Charles II., he undertook a fresh invasion of Scotland, and from Orkney passed over to Caithness, his little army almost annihilated by shipwreck. Neither gentry nor commons would join him; but he pushed on to the borders of Ross-shire, where, at Invercharron, his dispirited remnant of 4000 was defeated by Leslie's division, 27th April 1650. He fled into the wilds of Sutherland, and was nearly starved to death, when he fell into the hands of Major of Assynt, who sold him to Leslie. He was conveyed with all possible contumely to Edinburgh, where, dressed like a gallant bridegroom, he was hanged in the Grassmarket on a lofty gallows, 21st May 1650. Eleven years afterwards his mangled remains were collected from the four airs, and buried in St Giles's, where a stately monument was reared to him in 1888. He left a son, James, the 'good Marquis' (c. 1631-69), whose grandson in 1707 was created Duke of Montrose.

Montrose's few poems, all burning with passionable loyalty, are little known, save those one famous stanza commencing, 'He either fears his fate too much, to dare to face his chief, and yet its ascription to Montrose is doubtless first put forward in Watson's Collection of Scots Poems (1711). There are four portraits of Montrose—by Jameson (1629 and 1640), Dolson (1644), and Fordyce (1649). Of the former man the finest estimate is Mr Gardiner's: 'Who could love him: he was sure to bear himself as a Paladin of old romance. If he made any cause his own, it was not with the reason calculated of a statesman, but with the fond enthusiasm of a lover. When he transferred his affections from the Covenant to the king, it was as Romeo transferred his affections from Rosaline to Juliet. He fought for neither King nor breech, but, indeed, for an ideal of his own which he followed as Covenantar or Royalist. He went ever straight to the mark, impatient to shake off the schemes of worldly-wise politicians and the plots of interested intriguers. Nature had marked him for a life of meteoric splendour, to commingle and astonish a world, and to leave behind him an inspiration and a name which would outlast the ruins of his hopes.'

See the Latin Memoirs by his chaplain, Dr Wishart (Aram. 1647; partial English translation, 1756; complete trans. by Murdoch and Morland Simpson, 1883); Mark Napier's Memoirs of Montrose (1888; 4th ed. 1896); Lady Violet Greville's Montrose (1886); and Mr and Mrs. Gardiner's History of England, Civil War, and History of the Commonwealth and Protectorate.

**Montserrat** (Lat. Mons Serratius, so named from its saw-like outline), a mountain of Catalonia, in north-east Spain, 30 miles NW. of Barcelona. Its height is 4055 feet; and 'its outline,' says Ford, 'is most fantastic, consisting of cones, pyramids, buttresses, ninepins, sugar-loaves.' The pious Catalonians aver that it was thus shattered at the Crucifixion. It contains vast numbers of box-trees, ivy, and other evergreens. From the topmost height the eye wanders over all Catalonia. The mountain, however, owes its celebrity to the Benedictine abbey built half-way up it, with its wonder-working image of the Virgin, and to the thirteen hermitages formerly perched like eagles nests on almost inaccessible pinnacles. In 1811 the French, under Suchet, plundered the abbey, burned the library, shot the hermits, and hanged the monks (who had given shelter to their emigrant brethren in the Revolution). The place suffered still more in 1827, when it became the stronghold of the Carlist insurrection.

**Montserrat**, one of the Lesser Antilles, belonging to Britain, lies 27 miles SW. of Antigua. It is about 11 miles in length, 7 in breadth, and has an area of 32 sq. m. The surface is very mountainous (3000 feet), and heavily timbered. Sugar and provisions of inland limes are the principal products. The island, governed by a president and a legislative council, is the healthiest in the West Indies. The imports average nearly £25,000, and the exports £21,100. The island was discovered in 1493, and colonised by the British in 1632. It has remained British, but suffers from the short intervals of short-war years (1664-68 and 1782-84), when it was in the possession of France. Pop. (1881) 10,083; (1891) 11,762, of whom about 1500 were at Falmouth, the chief town.

**Mont St Michel.** See St Michel.

**Montyon Prizes,** rewards for signal instances of disinterested goodness discovered throughout the year, awarded by the French Academy, according to the will of the late Marquis de Montyon, a brother of the Marquis de Montcel (1733-1820), who bequeathed £120,000 to public hospitals, and the remainder of his fortune to give sums of money to poor patients on leaving Paris hospitals, and to found the prizes since connected with his name. Already in 1782 he had organised the prize list. After his return to France in 1815 he arranged the scheme in its final form. The Academy of Sciences awards annually a prize of 10,000 francs to the individual who has discovered the means of making any mechanical operation beneficial, or of improving its final result in any branch of medical science. Experiments made hereby, another of the work likely to have the greatest beneficial influence on morality—both alike of 10,000 francs a year.
The last are usually divided among several recipients, and for these there seems to be a somewhat liberal standard of interpretation, for in a single year (1884), for example, we find awards given to a Journey to Japan, a Life of General Channing, a History of English Literature, and an Essay on Morality. The same insistance extended to also to romance, all that seems required being some literary merit and a fair average of morality. Instead of rewarding works specially advantageous to morality, the Academy has been reduced to the necessity of crowning those which are content merely to deal with its subject. In 1883 they may accepted a legacy of 10,000 francs to recompense particularly filial piety. A society was formed in 1833 to publish cheap lives and portraits of all men to be regarded as benefactors to their species; whether the benevolent, as Montyton, Howard, and Mrs Pry, or special originators like Jenner, Franklin, Davy, and Jacquard. A medal bearing the heads of Montyton and Franklin was struck at its foundation, and a gold medal is given every year. See Memoir of Montyton by Labour (Paris, 1881), and Tailhardier’s *Prize de Vertu* (1877).

**Monument.** The Ancient Monuments Protection Act of 1882 constitutes the Commissioners of Works guardians of a certain number (some seventy groups) of monuments in Great Britain and Ireland; and provides for their being made guardians of as many more as from time to time the owners shall put under their care. The owners retain all their rights save as regards injuring or defacing the protected monuments; any person defacing or injuring them is liable to a fine not exceeding £5, or imprisonment for a month. The Commissioners, the specially appointed Inspector of Ancient Monuments, and their workmen have the right to do all that may be necessary to protect the monuments. In France famous castles and churches, as well as dolmens, &c., are among the monuments historiques protected by law.

**Monza** (anc. *Mediolanum*), a town of Italy, on the river Lambro, 9 miles by rail N.N.E. of Milan. It was anciently the capital of the Lombards, to whose queen, Theodolinda, it owes its chief public buildings, notably the cathedral (305; reconstructed in the 14th century); it was noted for its wealth and its extensive cloth trade in the middle ages. It has an interesting town-hall (1293), a royal palace (1777), and manufactures of cottons, hats, leather, &c. The cathedral contains many relics of Theodolinda, and the famous Iron Crown (see CROWN, Vol. III., p. 509), restored by Austria in 1846. Pops. 17,077.

**Moody, Dwight Lyman,** evangelist, was born February 5, 1837, at Northfield, Massachusetts. In 1854, after a youth of great poverty, he went to Boston, where, during his two years’ service as a shopman, he became converted. He went to Chicago in 1859, and here was active in Sunday-school mission work; and from 1855 he devoted himself entirely to Christian work. During his civil war he served the Christian Commission, and afterwards became practically the head of the Young Men’s Christian Association work in Chicago. In 1871 he was a leader in the Bankers’ and Protective singer, his life-long colleague. They worked with great success in most of the principal cities of the United States, and in 1873, 1881, and 1883 in Great Britain. Mr Moody died at Northfield, December 22, 1899. Here are the great schools for boys and girls, started in his own home in 1879; they accommodate about 1000 pupils. He published volumes of sermons and other works. See the authorised Life by W. R. Moody (1900).

**Mooltan.** See Multan.

**Moon.** the satellite of the earth. It ranks among the larger satellites of our system, being an almost perfect sphere of 2160 miles in diameter. It revolves at a mean distance from the earth’s centre of 258,833 miles. Its total surface is 0.974 of the earth’s, in eq. m. 14,657,402; and its volume 0.92934 of the earth’s, or in cubic miles 5,300,000,000, or in terms of the sun’s volume only 0.0007.

Its mass is 0.0128 of the earth’s, or in tons 78,000,000,000,000,000,000,000. Its density is 3.57 that of water, or 0.93 that of the earth. It travels in its orbit with a velocity of 3334 feet per second, and its equatorial velocity of rotation is 10 miles per hour. Presenting as large a surface to the eye as the sun, and changing both its form and position with great rapidity, it has necessarily always attracted a large measure of attention, and has proved in early ages and among savage peoples the most useful of the heavenly bodies for the measurement of time. Its motions, always interesting, have in modern times been most carefully observed and calculated, from their great value in enabling the traveller and navigator to determine the longitude (see Latitude and Longitude).

The explanation of the moon’s changes of shape, from a thin crescent to a full disc, is the first problem presented to the most careless observer. A little watching shows that these are due conjointly to the globular form of the moon, its motion, and the fact that it does not shine by native light, but simply reflects the solar rays. The illuminated (or convex) edge of its figure is always turned towards the sun. When right opposite the sun it appears as full, and sometimes is so situated as to be partially obscured by the earth’s shadow, the earth intercepting the solar light by which alone it shines. When it is near the sun in the sky it appears as a thin crescent, turning almost entirely its dark side to the earth. Sometimes, at new moon, it comes between us and the sun, obscurmg his disc either in a partial or total Eclipse (q.v.). At either half moon the moon is said to be in quadrature, or in the ’first’ or ’last quarter.’ At new and full moon it is said to be in syzygy (Gk. syn, ‘together;’ zygon, ‘yoke’). Our own observation will soon show that these changes result from the constant illumination of one side of the moon, and constant darkness of the other, the crescent being larger or smaller as, from the moon’s change of position, we see more or less of the bright side. Thus we see that the moon’s phases depend on its motions over the sky, with reference to the sun. These motions and their causes we next consider. And it is most convenient in doing so to discuss first the apparent motions — i.e. the

---

**Fig. 1.—Comparative Sizes of the Earth and Moon.**
FULL MOON, EXHIBITING BRIGHT STREAKS RADIATING FROM TYCHO.

Vol. VII., page 296.
manner in which the moon moves over the surface of the sky, changing place like a driving cloud, though not so thinly or so rapidly.

We can reduce all such motions to movements in the two easily-noted directions, first, north and south; secondly, east and west. And it is most convenient to take the sun as our point of reference. Sometimes the moon moves north or south of the sun, sometimes east or west. It moves more, then, in both of our two directions. When we compare the east and west motion with the north and south we soon note an important difference. The east and west motion is continuous through the whole year, always moving from moon right round the heavens; starting at new moon near the sun, and progressing until at full moon nearly the whole breadth of the sky separates them; then still progressing, until the sun is approached again from the opposite side. In fact, if the sun stood still at a setting for a brief month, we should see the moon soar steadily upwards in the western sky, cross the whole expanse of heaven, and pass down below the eastern horizon. Then it would continue its course, returning to the sun, beneath our feet, and reach nearly the opposite point of the heavens in the other direction—i.e., it would move directly from east to west again.

In the month, the cycle of the moon's motion is completed. In the sidereal month, discovered by Hipparchus, the moon travels round the earth in a curve, the period of which is about 27 days. In a solar month, the moon travels round the sun in a curve, the period of which is about 29 days. If we take a bright star as the starting-point and goal of the moon's circle, instead of the sun, we should find the moon only takes 27 1/3 days to make the whole circuit, or 29 1/2 days, this is called the moon's sidereal period. This shows that the difference in the motion of the moon is steady and in its position, while the sun slowly moves in its annual course in the same direction as the moon, which therefore has to overtake the sun when returning to it. Thus the motion from west to east is always in the same direction; but this is the case with the north and south motion. While performing its cycle from west to east, say in the month of March, the moon begins by travelling northward at first, but latterly swings as far southward. In autumn the reverse is the case (see below). In December the whole full moon occurs at the most northerly point of its course, and in June at the southernmost. In winter, therefore, we have at night most light from the full moon, and in summer least. In March the evenings have least moonlight, and in September the most. Attentively considering all these movements, we soon see that the moon travels round the earth in a curve not differing very much from a circle, for as it always appears nearly of the same size, it must remain constantly at the same distance from the earth.

We have now almost insensibly passed from the observation of apparent motions to the idea of an orbit or path, which the moon traverses. And this leads at once to the consideration of the nature of this orbit, or the moon's real motions. Accurate observation reveals that the moon's distance from the centre of the earth is not the same in different parts of its orbit. It varies in apparent diameter from a maximum of 33° 31' to a minimum of 29° 21'. As this variation forbids the idea that the orbit is a circle concentric with the earth, so also it forbids the idea that it is a circle, a perfect sphere, the points of which in the two directions are called the Nodes (q.v.), and the line joining them the line of nodes. The point of highest orbit nearest the earth is the perigee, that is, the point that is nearest the earth, and the line joining it is called the line of apsides. Both the line of nodes and line of apsides change their place, the former turning completely round in 6793 391 days =18 years, the latter in 2522 57 days = nearly 9 years. These motions take place, however, in such a way that the moon always proceeds on the same side with the moon's orbital motion, the line of nodes against it. These motions are due to the sun's disturbing influence (see Perturbations). Each day, on an average, the moon describes 13° 10' 35" of the circle of her path. To do this requires, at its distance from the sun, a velocity of 1 2/3 miles per hour. This velocity is found to be exactly what is required to balance the moon's weight, supposing that to be reduced in proportion to the square of its distance from the earth. Thus Newton concluded that the force retaining the moon in its orbit is simply its weight, or the mutual gravitation between it and the earth. This conclusion is verified by the elliptic form of the orbit, and the place of the earth in one focus. For an orbit of this form is produced by a force varying inversely as the square of the distance. Both the form of the orbit and the variation of velocity with distance are results of the force governing it, as well as the powerful disturbing influence of the sun, cause variations in the moon's velocity. Usually these are allowed for by taking as a foundation the mean or average angular velocity given above, and considering its variations under the title of inequalities. The first must always be allowed for if the moon's place in the sky is to be predicted with accuracy at any time.

First in order is the elliptic inequality discovered by Hipparchus. It is caused by the quicker or slower motions of the moon in its near or distant parts of its elliptic orbit. Its value is 6° 18' nearly. Secondly, there is the annual equation (discovered by Tycho Brahe), a yearly effect, arising from the increase and diminution of the sun's disturbing force, as the earth approaches or leaves the sun in its annual course. This amounts to 11° 10', and, as our earth is nearer the sun in winter and farther off in summer, it causes the moon to be behind its mean place in the first part of the year and before it in the latter months. Thirdly, there is the variation (discovered by Abul-Wafa). This arises from the differences in direction and amount of the sun's disturbing force, which are caused by the moon's motion in its own orbit. Its effect on the moon's longitude may amount to 39 31'. Fourthly, there is the eccentricity, depending on the position of the axis of the moon's orbit, and the line of nodes, with regard to the sun. Its effects are complicated, but may amount to 1° 16' 27" on the moon's longitude, and 8° 57' on its latitude.

Besides these, the parallactic inequality is interesting as giving a means of calculating the sun's distance from our earth. The sun's disturbing action varies in amount as the moon in its orbit is nearest or farthest away from the sun. This variation depends on the ratio of the moon's distance to that of the sun; so that, knowing the amount of the increasing and diminishing power of the moon, a value may be found for the sun's distance. Hansen showed by this means that the value long received for the sun's distance required to be diminished. See Parallax, SUN.

The secular acceleration of the moon was discovered by no less than 4000 years. This arises from the two inequalities of the moon, a value may be found for the sun's distance. Hansen showed by this means that the value long received for the sun's distance required to be diminished. See Parallax, SUN.

The secular acceleration of the moon was discovered by no less than 4000 years. This arises from the two inequalities of the moon, a value may be found for the sun's distance. Hansen showed by this means that the value long received for the sun's distance required to be diminished. See Parallax, SUN.
MOON

The moon's distance from the earth is obtained by observations of its place from two widely-separated stations, such as the observatories at Greenwich and the Cape of Good Hope. If simultaneously observed from these, the moon will not appear to both observers in the same position among the stars; the amount of difference in apparent position depending on its distance from the earth at the time. From this difference is deduced the moon's horizontal parallax. This is the change in the moon's place which would be noted by an observer on shifting his place from the centre of the earth to a point on its surface where the moon would be seen on the horizon. The moon's mass being very nearly $\frac{1}{24}$ of the earth's, the force of lunar gravity at the moon's surface is then such that any object would weigh there only 0.15 of its weight at the earth's surface, and a falling body would there only traverse 2,48 feet in the first second of its course. The moon's rotation on its axis agrees in period with its revolution round the earth, so that, as has been said, we have always the same side presented to our view. Occasionally, however, we see a little round one or other edge owing to Libration (q.v.).

From these conditions of size, density, and mass we should expect that, while presenting some features of agreement, in most respects the moon would differ widely from the earth in physical condition. Even to the naked eye some peculiarities are obvious. Attentively watching the full moon, we soon become familiar with its irregularly-spotted surface, which never changes. It cannot then be like that of the earth, which is often obscured by clouds and mist. The telescope confirms this impression. All the details of the lunar surface are hard, cold, and glaring in their delineation. The delicate colouring and shade of terrestrial scenery is entirely absent. All is marked in white and black, or in various shades of yellowish gray. Nothing like mist, cloud, or vapour has ever been seen, except in some doubtful instances on the floor of the crater Plato, or other deep depressions. There is neither vegetation nor furrows to bear clouds. Observation of the stars occulted by the moon (see OCCULTATIONS) confirms this, and, if there be even an attenuated atmosphere, it cannot have more than $\frac{1}{44}$th of the surface-density of our own. Bessel's maximum value for this of $\frac{1}{48}$ has been shown to be too small, and it is not improbable that the moon possesses an atmosphere of extreme rarity, having a surface-density of probably about $\frac{1}{24}$th of that of the earth. Vegetation and animal life appear to be equally absent from the moon, and the best modern theories of its state requires us to regard the surface as either bare rock and sand, or as ice and snow. These theories have arisen in the attempt to explain the strange forms of the lunar surface. These forms have been classified, and the arrangement commonly in use is followed here as convenient. But it must not be regarded as absolutely scientific; some formations, while in their general aspect belonging to one class, might really be assigned to other classes in other respects.

The term Mare (Lat.) has been applied to the large dark plains, an example of which is the Mare Orientale, easily seen as an oval dark spot near the edge of the new moon. There are also large level areas which are brighter, and to which no special name has been attached. To one large irregular dark plain the title of Oceanus Procellarum has been given. The terms Palus (marsh), Lacus (lake), and Sinus (gulf) have been somewhat fancifully used to denote smaller dark areas.

Under the broad title craters have been grouped many formations, so different from one another that seismographs now divide them into walled plains, mountain-rings, ring-plains, crater-plains, craters, craterlets, crater-pits, crater-cones, and depressions—names expressive enough of more or less circular ramparts varying in size from 150 miles in diameter to a few hundred yards, and in depth, or height of walls, ranging from 18,000 feet downwards. In some parts of the lunar surface these literally swarm, crossing and interrupting one another, smaller ones perched on the edge or sides of larger ones, and, generally, in the flat bottom of the larger ones several of the smaller kinds are sure to be seen. Any moderately good telescope will show the larger classes besides these there are the true mountain ranges, called the Lunar Alps, Apennines, Cordilleras, &c., similar in most respects to terrestrial chains. These range from 20,000 feet in height downwards, and, where their profile is seen at the edge of the lunette they form distinct outlines. The lunar rilles (so named by Schröter, their discoverer, in 1787) are cliffs or cracks in the surface, passing often right through mountains and valleys, sometimes for a distance of 300 miles, their breadth being relatively so small as to give them the appearance of true cracks.

Most striking of all lunar appearances are the broad white range, which diverge from some of the principal lunar ring-plains. These proceeding from Tycho extend, in one case at least, nearly 2000 miles. There are hundreds of them, and they
range from 10 to 20 miles broad. They pass right over mountains and plains, taking of the shape of the hills, parallel to them, but diverging from it in brightness. There are seven principal systems of these inexplicable streaks.

To denote the relative brightness of lunar formations a scale is used, the brightest being called 10, and the less bright 9, 8, &c., down to 0. Those markings on the surface of the moon, which are the principal mountain ranges have been named after those on the earth. The craters are named after astronomers or philosophers, as Tycho, Plato, Aristotle, &c. The different parts of these, and smaller objects near them, are known by Greek or Roman letters, attached to the name of the chief object. Greek letters are used for peaks and hills, Roman letters for craters and depressions. Capital letters imply measured objects. For rills the letters $\phi$, $\xi$, $\chi$, $\theta$, and $\eta$ are chiefly used. But there are occasional variations from these rules, as in the case of most astronomical nomenclature.

These peculiar appearances, so different from those around us on the earth, have much puzzled astronomers. The usual theory attributes them to volcanic action, combined with shrinkage of the lunar globe. It is generally agreed that they are due to the result of slow glaciation, the craters being lakes, around whose margins the quickly condensed vapour from their surfaces has fallen in mountains of ice. The craters are vents for water-vapour, and their cones masses of ice. To this theory the extreme purity of the lunar atmosphere is favourable, but it cannot be said, any more than the volcanic theory, to meet all the difficulties.

No thoroughly satisfactory explanation has as yet been proposed.

The total amount of light given by the full moon is only a millionth part of that given off by the sun. Its photographic intensity, however, has admitted of several fine photographs being taken, notably by Rutherford of New York, and recently by the fine telescope of the Lick Observatorv, California.

Harvest-moon.—At or about the time of harvest in the north temperate zone the moon in its annual course is approaching the celestial equator, which it crosses from north to south on September 22. On that date it sets close to the exact western point of the horizon. If it happens to be then also full moon, the moon rises that evening as the sun sets, and as at its rising outline on the east, or close to the exact eastern point of the horizon. Thus it begins to give light at sunset, and continues to do so until sunrise, when it sets opposite to the sun, just as the latter rises. This arrangement holds good without any great change for several days, so that there is practically no darkness, especially if the weather be fine. The full moon which thus illuminates the autumn nights is called the harvest-moon. No other full moon in the year rises for so many days in succession so soon after sunset. If the date of full moon be not exactly September 22, still the same phenomena occur, though not with the same perfection, and the longer the interval between full moon and that date the less perfect they are. This is because the full moon, being on September 22, coincides with the time when the moon, in rising, is coming close to the exact position of the equator. If the moon is crossing the celestial equator from south to north, at which time its northward motion is most rapid. The position of any body on the Celestial Sphere (q.v.) determines the time of its rising at any place in our latitudes, and, if that position be altered, the time of rising will be altered also. If it moves southward the moon will tend to rise later, if it moves northward it will tend to rise earlier.

We have seen that the moon's northward motion is most rapid when crossing the equator. Hence it has then a strong tendency to rise earlier each evening. But its motion towards the east (or downwards, when it is on the eastern horizon) gives it a tendency to rise later. The opposite tendencies, in the case of the September full moon, approach a balance, if the observer be in the latitude of northern Europe. Therefore the moon in that case rises only a few minutes later each evening for about a week. Farther north, about lat. 64°, a balance is less readily attained. The opposite tendencies of the moon rises at the same time. Still farther north it rises earlier the second evening. But the most generally observed phenomena are of course those to be seen between latitudes 40° and 60°, which consist in the nearly full moon rising but little after sunset for several days in succession.

In these latitudes of the southern hemisphere March enjoys the benefit of the harvest-moon, as September does in the north. And as eclipsal appearances are reversed to observers in different hemispheres, it follows that, when we have most benefit from the full moon, our neighbours at the antipodes have least.

The best charts of the moon's surface are those by Lohmann, Beer, and Mädler, Schmidt of Athens (a gigantic work), and the Committee of the British Association. For information concerning the Moon, by Beer and Mädler (1837); The Moon, by Ed. Nash (1876); The Moon, by Nasmyth and Carpenter (1874; new ed. 1885); and for the lunar theory, popularly treated, Of Gravitation, and Sir J. Herschel's Outlines of Astronomy.

Superstitions regarding the Moon.—The moon was anciently an object of worship, and even in the 17th century she was supposed by the common people of England to exercise great influence over human affairs. The times for killing animals for food, gathering herbs, cutting down wood for fuel, sowing seeds, and various kinds of garden work, were determined by the 'age' of the moon, and these set periods were considered to be a necessary part of practical knowledge and ignorance or neglect of them to be infallibly productive of loss. There were similarly defined periods for taking particular medicines and attempting the cure of particular diseases. Many such superstitions prevailed till a recent period in the Highlands of Scotland, favourable or unfavourable consequences from any occurrence being predicted according to the age of the moon at the time it happened. Throughout Scotland the waning moon was considered to have an evil influence, and full or new moon to be the most auspicious season for commencing any enterprise. The same opinion was held in Scandinavia and Germany, and the history of all nations teems with similar superstitions. The special influence of the moon on persons of weak or wavering reason is preserved in our words lusitice and moon-struck, and is still an article of popular belief. Amongst mere superstitions must be ranked the old and widespread belief that the changes of the moon influence the weather on the earth, bringing about fair or rainy, settled or stormy weather; so that from the moon's periods predictions as to the weather may be made. The only known weather influence is a slight but appreciable tendency to dispersion of clouds shortly after full moon. See the article on Superstitions.

In the Edda we read that 'Mundilföri had two children—a son, Mání ('moon'), and a daughter, Sól ('sun');' and in German the moon is masculine and the sun feminine to this day. It was the same in Anglo-Saxon, although modern English has in this matter followed the classic mythology, in which Phoebus and Sol are gods and Selene, Luna, and Diana are goddesses; Grimm (Deutsche Mythologie, p. 666) quotes an old invocation to the 'New Moon, gracious lord' (Neuer Mon, Höhler Herr), for increase of wealth; and down to recent times
the German people were loud of speaking of 'Frau Sonne' and 'Herr Mond' ('lady sun' and 'lord moon'). The name appears (thus of man) of gender is found among the Lithuanians, Japanese, and even the ancient Mexican Mestizo ('moon') was masculine. Among the Slavs, according to Grimm, the moon is masculine, a star feminine, and the sun neuter. See the Rev. T. T. Edwards, Myths of All Ages (1886), itself containing a good bibliography.

**Moon.** Mountains of the, have played a mysterious part in African geography since the days of Ptolemy, who indicated them as containing the sources of the Nile. Their exact position was not known; they were generally figured on medieval maps as a high range crossing the entire continent from Abyssinia to the Gulf of Guinea. As modern enterprise has opened up the interior of Africa, different mountain- chains and peaks have been identified as Ptolemy's Mountains of the Moon—for instance, the mountains of Abyssinia, the groups of Kenia and Kilimajaro, the so-called Kong (q.v.), Mountains inland from the Gulf of Guinea, and finally Mr. Stanley's Ruwenzori and its fellows.

**Moonshiners.** A term in popular use in America, especially in the south-eastern states, for illicit distillers of whisky.

**Moonstone.** See Felspar.

**Moonwort** (Botrychium lunaria), an interesting fern, native of Britain, and widely distributed over northern Europe, penetrating to within the Arctic regions and Asia, and along with the few other species of which the family is composed appearing also in North America. The plant is of simple structure, consisting of a root-stick bearing a single erect stem from 3 to 6 inches high. A single pinnate leaf springs from the stem about midway from root to apex, the segments being half moon-shaped, pale green, and of thick consistence. The fructification is developed on a branched spike, pyramidal in outline, from 1 to 2 inches long, the branches all turning to one side. B. virginicum, another growing species, is named the Rattlesnake Fern, from the coiled spiral of the generative abounds in places frequented by that reptile.

**Moor.** See Bog, Peat, Waste Lands; and for Grove Moors and Moorfowl, see Grove.

**Moor, Dr John,** the author of Zetesco, was born in December 1729 at Stirling, a minister's son. Educated at Glasgow, he there studied medicine, and there began to practise, with Smollett's and his own old master, Dr Gordon, for his partner, after spending some time in Holland (as army surgeon), in London, and in Paris. As medical attendant to the young Duke of Hamilton he travelled six years on the Continent, and on his return (1778) settled in London. His View of Society and Manners in the Rhine Provinces, Germany, and Italy (4 vols. 1779-81) was well received; but the novel Zetesco (1789), which suggested Byron's Childe Harold, is to-day the least forgotten of his works. These include two other novels, Medical Sketches, and a couple of books on the French Revolution. Dr Moor died at Richmond, 21st January 1802. See the Memoir by Dr R. Anderson prefixed to his Complete Works (7 vols. 1820).

**Moor, Sir John,** English general, born at Glasgow, 13th November 1671, was eldest son of the preceding. He entered the army as ensign when only fifteen, and first distinguished himself in the Cossacks (1724); he served in the West Indies (1750), in Ireland during the rebellion of 1798, and in Holland in 1799. He was in Egypt in 1801 with the army under Abercromby, and obtained the Order of the Bath for his services in command of the reserve. When war again broke out in 1802 Moor served in Sicily and Sweden. In 1808 he was sent with a corps of 5000 men to Portugal to form the English army in the Peninsula. He arrived in Mondego Bay, August 19, and assumed the chief command on the return to England of Sir H. Burrard. In October he received instructions to cooperate with the forces of Spain in the expulsion of the French from the Peninsula. He moved his army from Lisbon with the intention of advancing by Valladolid to unite himself with the Spanish general Romana, and threaten the communications between Madrid and France. But the apathy of the Spaniards, the successes of the French in various parts of the Peninsula, above all, the folly and intrigues of his own countrymen, soon placed him in a critical position. Yet he had determined to make a bold advance from Salamanca to attack Soult when the news reached him that Madrid had fallen, and that Napoleon was marching to crush him at the head of 70,000 men. Moore's forces amounted to only 23,000 men, and he was consequently forced to retreat. In December he began a disastrous march from Astorga to Coruna, a route of near 250 miles, through a country from mountainous country, made impassable by snow and rain, and harassed by the enemy. The soldiers suffered intolerable hardships, and arrived at Coruna in a very distressed state. It was impossible to embark without fighting, and Soult was in readiness to attack soon as his troops should begin to embark. The battle was made by an action that destroyed the cavalry after destroying their horses had gone on board, and the bulk of the artillery, for which the ground was not adapted, had been withdrawn. On the 16th January 1809 the French came on in four strong columns to a separate battle ensued. While animating the 42d Regiment in a brilliant charge in an early stage of the action, Moore was struck by a cannon-ball on the left shoulder and died in the moment of victory. The French were defeated with the loss of 2000 men; and the dead leader was buried at night past the embarkation of his troops. The British army in this expedition lost their magazines and 6000 soldiers. Soult, with a noble feeling of respect for his valour, raised a monument to Moore's memory on the field of battle, and at home another was erected in St Paul's Cathedral. His unfortunate campaign was sustained by the purest virtue and governed by a disinterested patriotism, while a certain heroic ascendency of character and the singular beauty of his person powerfully impressed every one who came near him. Wolfe's verses on the burial of Sir John Moore have helped to keep his memory green. See the Life by his brother (2 vols. 1834), and Napier's Peninsula War (vol. i.).

**Moore, Thomas,** the 'Hard of Erin,' was born at 12 Augier Street, Dublin, on 28th May 1779, the son of a Catholic grocer. From the school where he never was properly educated, and where he himself became a 'determined rhymer,' he passed in 1794 to Trinity College, and thence, after taking his B.A., proceeded in 1799 to London to keep terms at the Middle Temple. He brought with him a translation of Anaeneus, which came out in 1800, dedicated to the Prince of Wales, his patron then, but the butt from 1813 of the Whigs, satirising it proved a great hit, and, with his musical talent, procured him admission to the best society. In 1801 followed the Poetical Works of the late Thomas Little, whose pretty erotica were a good deal admired, and he was made a Baronet. In 1803, through Lord Moira's influence, he was appointed registrar of the Admiralty court at Bermuda. He went there to arrange for a deputy, and, after a tour in
the States and in Canada, returned in a twelve-month to England—the democratic notions of his Dublin days toned down by his transatlantic experience. For his Odes and Epistles (1806) he was sharply taken to task in the Edinburgh. The following year (1808), Byron's name passed over which Byron made so merry, but which left the non-combatants fast friends for life. In 1811 he married an actress, good Bessy Dyke (1793–1865), and after living successively in Leicester- shire, in Derbyshire, and at Hornsey near London, in 1817, he rented a house in Shepherds Bush, near Bowood, Lord Lansdowne's seat, in Wiltshire.

Meanwhile, among other fugitive pieces, Moore had published the earlier of the Irish Melodies (ten parts, 1807–34) and The Two Penny Post-bag (1812), whose tropes at once glittered and stung. Now he became anxious to emulate his brother-poets, who published in quarto. He fixed on an oriental subject, and in 1817 the long-expected Lalla Rookh appeared, dazzling as a firefly; and the whole English world applauded. For the publication he went with Rogers to Paris, where he wrote The Corsair, and his Lalla Rookh the Long- man's paid him 3000 guineas; the Irish Melodies brought in £500 a year; but Moore had 'a generous contempt for money,' and about this time his Bermuda deputy embezzled £6000. Moore's liability was reduced by an economical life (1800), which he usually paid for in his pen; but in 1810, to avoid arrest, he went to Italy with Lord John Russell. He spent five days at Venice with Byron (his friend since 1811), went on with Chantrey to Rome, and then with his family fixed his abode in Paris, where he wrote The Loves of the Angels (1825) and a prose romance, The Epigram (1827). He returned in 1822 to Sloperton; and here, except for occasional 'junketings' to London, Scotland, and elsewhere, he passed his last thirty years. To those years belong the Memoirs of Captain Birk (1824), the History of Ireland (1825), and the Life of Sir John Moore (1825). Byron (q.v. 1830), and Lord Edward Fitzgerald (1831). In 1835 he received a pension of £3000, but his last days were clouded by sorrow and suffering—the loss of his two sons, and the decay of his mental faculties. 'I am sinking,' he wrote in 1846, 'into a more vegetable. He died on 25th February 1852, and was buried in Brompton Cemetery.

Moore in his lifetime was popular as only Byron; but to-day he ranks far below Wordsworth, Shelley, and Keats. His muse was a spangled dancing-girl, light, for some thirty years, dominating the Loves of the Angels, his most ambitious effort, falls beneath the Byronic standard; Lalla Rookh, again, is brilliant, but fatiguing. He is best in his lyrics; and even in them there is a certain sameness, with their eternal 'love of the country, the wise of other countries, and of the women of all countries.' See his Memoirs, Journal, and Correspondence, 'edited' by Lord John Russell (8 vols. 1832–56); Vattat, Thomas Moore, ses Vie et Oeuvres (Paris, 1886).

Moors, a vague ethnographical expression applied to people whose geographical frontiers have been constantly shifting. First given (Manni) to the desert countries that lie between the Roman province of Mauretania, comprising within variable limits the whole country west of Numidia, now called Algeria and Morocco, later on it included the inhabitants of the whole of Africa north of the Sahara and Atlas from Tripoli westwards. He first was the great name of the African church of Tertullian, Cyprian, and Augustine; in 429 the country was overrun by the Arian Vandal's from Spain, but was recovered for the Byzantine emperors by Belisarius (533–36); invaded by the Arabs in 647, it was speedily subdued, and the Moors embraced Mohammedanism as quickly as they had embraced Christianity, and have clung to it ever since. It is possible that the country itself has been gradually occupied and colonised by the French, with the exception of Tripoli and Morocco. The Arab slave-dealers and mixed Arab and Negro clans to the south are sometimes called the Moors of the western Soudan. In early or prehistoric times it is possible that tribes of the Moors and of southern Spain, the builders of the megalithic monuments, may have been of the same race in both continents.

Whether in Algeria or in Morocco the Moors cannot be considered as a pure race. Some authorities take them as nearly equivalent to the Berbers, even the nomad tribes; others restrict the name to an admixture of Arab blood, and call Moors only the more settled Arabic-speaking population of the towns. According to some the Arabic stock is the pure Berber stock of the Sahara; or it is the Hamitic element in the resultant Moor. Though still numerous, the town Moors seem destined to dwindle before the European colonists.

The non-morn Berber or Kabyll tribes will probably maintain their ground.

In European history the term is applied in a general way to the inhabitants of the Barbary states under Turkish rule, and to the actual inhabitants of Morocco, but in a special sense to the Arab and Berber conquerors and occupants of Spain from 711 to 1492. Within twenty years from their first landing these tribes had overrun the whole of Spain except the Asturias, had got possession of the Narbonnaise (710), had raided into France, till finally expelled by Charles Martel near Tours in 732. For a short time one calif ruled the whole of Islam from beyond Bagdad to the Atlantic. When in 750 the Albeid calif moved his capital from Cordova to Damiet (Califs), a descendant of the latter, Abderrhaman I., escaped and founded the califate of the West at Cordova in 755. His dynasty lasted till the degradation of Hushain III. in 1031. Then after a period of anarchy the Almoravides (Berbers) succeeded from 1011 to 1146, and the Almohades from 1146 to 1232. The greater part of Spain had now been lost, but the Beni-Nasr held Granada from 1232 to 1492. The chief steps of the Spanish re-conquest are the taking of Toledo, 1085; Saragossa, 1118; Valencia, by Jaime I. of Aragon, 1238; Seville, 1248; Murcia, 1266; Granada, 1492. The Bedouin, these invaders of Spain were mainly of Arab blood, and brought with them capacities of civilisation.

From the 8th to the close of the 11th centuries the Spanish Moors in architecture, literature, science, industry, manufacture, and agriculture were far in advance of any northern European race of that date; no other people in western Europe could have then built a cathedral like the mosque of Cordova (784–793); in philosophy and in the terms of mathematical and astronomical science they have left their impress; in the arts, and in the gorges of western Europe. Only in religion were they inferior, and even here their toleration of the Christians, though contemptuous, contrasts favourably with that of the Christians towards the Moors after the conquest. But after the 12th and 13th centuries the Moorish conquerors had no reserve of civilisation or of increasing resources to fall back upon in northern Africa; they were degenerating, while behind Christian Spain was a Europe ever growing more civilised and richer in resources of every kind. The conquest was completed by the division and intestine struggles of the Christian kingdoms; but these same causes told far more fatally on the Moors.
There were never more than five or six separate Christian kingdoms; but the Moorish states were at times divided among over twenty little kings, and every dynasty in succession fell to pieces through intestine strife. The latest researches, especially in numismatics, are continually adding fresh proofs of this dissention, and augmenting the number of petty independent princes or chiefs. The advance of the Turks westward after the taking of Cairo (1517) was too great to help these co-religionists in Spain. Barbarossa established himself in Barbary in 1518; but he failed at Malta in 1531 and 1555, and after the battle of Lepanto (1571), however much the Moors might harass Spain, there was no real danger of a recrudescence of local effects served to raise a hatred between two chivalrous races who had once respected each other and to carry it to the bitterest fanaticism.

Moose. See Elk.

Moosonce, a Canadian district south of Hudson Bay, and touching Lake Superior and Lake Winnipeg. It is the see of an Anglican bishop.

Moplas, a race of Southern India, mainly near the Malabar coast, who as fanatical Mohammedans have caused trouble by outbreaks. Descended from the old Arab traders, they number about 700,000.

Moquis. See PUEBLOS.

Moradalab, a town of British India, capital of a district, and centre of a large trade in country produce, stands on the Rangamuk, 100 miles E. by N. of Delhi. It is noted for its metal-work. Pop. 13,000 (1881).

Moraine. The masses of rock which, by atmospheric action, are separated from the mountains bounding the valleys along which glaciers flow, find a temporary resting-place on the surface of the ice, at the margin of the glacier, and are carried along with it, but so slowly that they form a continuous line along each margin. These lines of debris are called lateral moraines. When two glaciers unite, the two inner moraines unite also and form one large trail in the middle of the trunk glacier, and this is called a terminal moraine. A large portion of these rocky fragments at length reach the leeward side of the ice, and, as the ice leaves it as a huge mound, which is known as a terminal moraine. The rock-deliris, sand, clay, gravel, &c., which are dragged forward underneath the ice, are called ground-moraines, or moraines profondes. See GLACIERS, BOULDER-CLAY.

Morallities. See MYSTERIES.

Moral Philosophy. See ETHICS.

Morano, a city of Southern Italy, built on a hill near a wild marshland, 37 miles N.W. of Cosenza. Pop. 8,256.

Morar. GAVIAL.

Morat (Ger. Murten), a town of 2,949 inhabitants, in the Swiss canton of Freiburg, 12 miles E.S.E. of Neuchatel and 48 by rail N.N.E. of Lausanne, lies on the Lake of Morat (34 by 2 miles, 1428 feet above sea-level). Here, on 25th June 1476, the Swiss gained a victory over Charles the Bold, Duke of Burgundy.

Morata, OLYMPIA, a 16th-century scholar, was born at Ferrara in 1526, the daughter of the poet Fulvio Pellegrino Morato (who died in 1547). Already in her sixteenth year she gave public lectures in her native city; but, having in 1548 married the German physician Andreas Grunder, she followed him to Germany and began a pious and ardent. Driven from place to place by the religious wars and reduced to penury, she died at Heidelberg, 26th October 1555, leaving numerous Latin and Greek poems, mainly on religious subjects (edited 1559, 1679, &c.), a treatise on Cicero, dialogues, letters, &c. See the Monograph by Bonnet (4th ed. Paris, 1865).

Moratini, LEANDRO, FERNANDEZ DE, comic poet, was born at Madrid, March 10, 1760, and was the son of a poet. In 1790 appeared his first and best comedy, El Víejo y la Niña; it was followed by La Condesa nueva, El Baron, La Magistrada, El Dr. de la Religión, and several ecclesiastical benevo- lences, under which Bonaparte made him chief royal librarian; but after 1814 he took refuge in Paris. He died in Paris, June 21, 1128.

Morava. See MARCII (river).

Moravia (Ger. Mähren), a crown-land of the Austrian empire, is bounded N.E. by Silesia, S. by Hungary, S. by Lower Austria, and N.W. by Bohemia. Area, 8385 sq. m. 2,017,274; (1890) 2,276,570. It is enclosed on all sides by mountains, being separated from Silesia by the Sudetes, from Bohemia by the Moravian chain, and from Hungary by the Carpathian Mountains; while branches of the Carpathian Mountains except in the south, where there are extensive plains rising to about 800 feet. Numerous small rivers flow south-east, and fall into the March or Morava, from which the country derives its name, and which joins the Dunle. The Oder rises among the mountains on the north-east, and soon leaves the country. Moravia is essentially an agricultural region. On the whole the soil is rich, 56 per cent. being cultivated and 14 meadows and grass, and the temperature is more genial than in other European countries lying on the same parallel. The principal crops are rye and oats; then come barley, wheat, potatoes, beet-root, leguminous plants, and many fruits and vegetables. The breeding of all the usual varieties of domestic animals is actively prosecuted. The principal mineral products are coal and iron, with some graphite. The principal branches of industry are the manufacture of wooden, linen, and cotton goods, and beet-root sugar. Silk-weaving, lace-making, iron-founding, tanning, brewing, distilling, and the manufacture of chemicals, glass, paper, tobacco, and furniture also flourish. Brun (q.v.), the centre of the railway network, is a textile manufacturing town, and Olmütz (q.v.) the principal cattle-mart. The former university at Olmütz is now represented by a theological faculty, and by a large technical institute at Brunn. The majority (35 per cent.) of the people belong to the Church of Rome; by nationality, 78 per cent. are Slavs (Czechs and Moravians) and 29 per cent. Germans.

Moravia was formerly occupied by the Quadi, who were succeeded after the 5th century by the Rugi, the Heruli, and the Longobardi, and finally in the 7th century by the Slovians. Charlemagne brought the people under nominal subjection. Christianity was first established in the middle of the 9th century by Cyril (q.v.) and Methodius. In 871 its ruler was made a duke by
the emperor; he subdued the Bohemians and incorporated their country with his own. From 1029 it was associated with Bohemia, and at the close of the century was erected into a margraviate, and elevated to the dignity of a kingdom, the crown from the prince, the Bohemian, passed to the crowns by the younger branches of the royal family. On the death of Lewis II. at the battle of Mohacz in 1526, Moravia, with all the other Bohemian lands, fell to Austria, in accordance with a preexisting compact of succession between the reigning dynasties. Bohemia, Saxony, were formally separated from Bohemia, and declared a distinct province and crown land. See Duuk, Mährens allgemeine Geschichte (11 vols. 1860-86).

Moravians, otherwise known as Herrnhuters. The Church of the Brethren, or The Unity of the Brethren, are a small body of Protestants who claim to be the modern representatives of the ancient church of the Bohemian Brethren (see Bohemia), or Unitas Fratrum, which first took a definite shape in 1537, when the followers of Peter of Chlevezick, a pious layman and a contemporary of Huss, formed themselves into a separate ecclesiastical community outside the Reformed Church. They held that all Christians should lay aside distinctions of rank, abstain from military service and the use of oaths, and live in literal accordance with the teaching of Christ. These views forced them to leave Bohemia. Both the Boheims and the Moravians, who were converted in 1525, were Roman Catholic priests, though the first beginnings of the church are wrapped in a mist of confused traditions and miraculous tales. Under the influence of Lucas of Prague, a man of strong character and great literary talent, the Brethren in 1541 abandoned the strange views, but maintained their stern and rigid discipline, and by the beginning of the 16th century there were between 300 and 400 churches in the Unity. They had much friendly intercourse with Luther, but stood out for the celibacy of the clergy, the doctrine of works, and ceremonial regulations. And when the Unity was under the influence of Lutheran ideas, though the Brethren had naturally a much stronger sympathy with Calvinism. From the commencement of its history it has been alternated between two parties, the reformers and the church. In 1742, after 25 years of separation, and many of the Brethren, especially in the early part of the century, were forced to flee to Poland and Prussia. In 1570 the Polish branch united with the Reformed Church, and, though in 1600 the Bohemian and Moravian branches included two-thirds of the population and most of nobility, the Brethren having got mixed up with the revolution which ended so disastrously in 1620, by 1627 the church was entirely broken up and destroyed. In 1722 some of the Moravian descendants of the suppressed Unity, who had been roused by the preaching of a certain Rev. Peter Zinzendorf, a Moravian Catholic, resolved to emigrate, and were allowed by the pious young Count Zinzendorf (1700-60) to settle on a part of his property in Saxony, close to the Austrian frontier. The first company consisted of seven families, their wives, four children, two relations, and David and Adam, the boundaries of the land, and by pious and fanatical people of various nationalities. Five years later settlers arrived in the Baltic and parted with the Luther pastor, and adopted wild and extravagant views. Owing to the exertions of Zinzendorf peace was restored, and the settlers formed themselves into a society in communion with the Lutheran Church, and drew up certain rules for their guidance in all matters of religion and conduct, the chief of these being that all in Herrnhut should resolve to live like brothers of spirit, and at home and with all the children of God in all religions.

Twelve elders were chosen to be the teachers and overseers of the community, and these came to be assisted afterwards by male and female 'labourers' of all sorts, including inspectors of spiritual misuses, and were the debt of the Brethren for the goods sold by the Brethren. August 13th of this year (1727) is still celebrated as the spiritual birthday of the renewed church. By 1753 the Society had become a distinct church, and in 1753 the first bishop was elected and was ordained by Jablanski, court chaplain in Berlin, one of the two surviving guardians of the precious apostolic succession, which had been handed down by Amos Connenius, the last bishop of the old Unity. Although the Moravians imitated certain parts of the constitution and polity of the original church, much of what was peculiar in their views and discipline is to be traced to Zinzendorf, who was consecrated bishop in 1757, and was their 'advocate' until his death in 1760. The members of the community were divided into 'bands,' which met to exchange experiences, study their Bible, and the like; and there was a special division, still maintained, into 'choirs,' which consisted respectively of unmarried men, unmarried women, married couples, widowers, widows, boys and girls. Some of the 'choirs' had their own houses, where the members lived under a separate and independent system. There were two daily services in which all joined, and hourly prayer was kept up night and day by certain members of the bands, while every morning the Brethren were supplied with a text as a 'watchword.' Love-feasts were introduced by Zinzendorf, and are still held, though the practice of feet-washing before the communion has been abandoned. All important matters, even marriage, were decided by an appeal to the 'lot,' and, as Zinzendorf taught that death was a joyful journey home, the departure of a brother or sister was announced by blowing a trumpet, each 'choir' having its own peculiar air.

Various branch settlements were established in Germany, America, and Britain, and in these the Herrnhut arrangements were strictly carried out; but, when the different aggregations were set up, or societies were created, composed of members of other Protestant churches, as Brethren might belong to either of the three 'tropes'—the Lutheran, the Reformed, or the Moravian. These 'diaspora' societies contain at present 70,000 members, and the German 'diaspora' mission is the most important part of the home-work of the Brethren. Some of the Moravians came into contact with the Wesleys and Whitefield, and had considerable influence on their views, and they were even compromised by the Orangemen. Ignorance, owing to misrepresentation and partly owing to injudicious conduct on the part of some of the Brethren, their use of certain foolish hymns and sensuous and grotesque language in reference to the wounds of Christ, has had to be aginst them, especially in England and the Continent. Since the middle of the 18th century the home history of the Unity has been uneventful.

At present the executive government of the church is vested in the Elders' Conference of the Unity, a council formed by the union of partly of bishops and partly of presbyters. This conference carries out the injunctions of the synod, the supreme court of the church, which meets every ten
by the nobles in arms against Mary, and found her a prisoner at Lochleven, and himself appointed regent of the kingdom. In his famous interview with the queen on the 15th he 'behaved himself rather like a ghostly father unto her than like a counsellor. On Mary's escape, he defeated her forces at Langside, near Glasgow (13th May 1568), and afterwards was one of the commissioners sent to England to conduct the negotiations against her. He then, as always, acted with extreme wariness; and after his return to Scotland by his vigilance and prudence he succeeded in securing the peace of the realm, and in settling the affairs of the church. But on 20th January 1570 he was shot at Linlithgow by James Hamilton of Bothwellhaugh, who was instigated thereto by Mary's adherents, and prompted also, it may be, by personal enmity. He was buried in St Giles, Edinburgh. Of his ambition there can hardly be question; still, the most different estimates have been formed of his character, according to men's estimates of Mary. See Mary Queen of Scots, and works there cited.

Moray Firth, an indentation of the German Ocean, on the north-east coast of Scotland, measuring 21 miles in length, its extremity being in Ross-shire, to Stotfield Head, near Lossiemouth in Elginshire, and 30 miles thence to the mouth of the river Beauly. The name is sometimes applied in a wider sense to the whole extent of sea between Kinaird's Head in Aberdeenshire and Duncansby Head in Caithness.

Morayshire. See Elginshire.

Morbihan, a maritime department of France, formed from ancient Brittany, with the Atlantic on the south and Finistere on the west. Area, 2,924 sq. m.; pop. (1872) 490,582; (1891) 544,470. The coast is much indented, and has a multitude of bays, promontories, harbours, and islands. The largest island is Belle Ile (q.v.). The department forms a plateau of no great elevation, partly cultivated, partly occupied by extensive tracts of heath and marsh (see Brittany). Morbihan is divided into the four arrondissements of Vannes, L'Orient, Ploumuc, and Pontivy. The chief town is Vannes (q.v.), but the most populous is L'Orient (q.v.). Jers and the islet of Noirmoutier, still part of Morbihan; communal proprietorship survives there, and in some of the islands the coré, assisted by a council of notables, governs the people in a patriarchal fashion.

Mordants. See Dyeing.

Mordaunt, Charles. See Peterborough.

Mordvin, a Finnic race, now however greatly intermingled with the Russians, who dwell along the middle course of the Volga, from the government of Nijni-Novgorod to that of Samara. They number about 700,000.

More, Hannah, was the fourth daughter of the village schoolmaster of Stapleton, near Bristol, where she was born in 1745. As a child she showed great quickness of apprehension and a good memory. Her sisters were sent to a school in Bristol, and when the eldest was twenty-one they opened a boarding-school there, to which Hannah went when she was twelve years old. She wrote verses at an early age, and in 1762 she published The Search after Happiness, a pastoral drama. In 1774 she went on a visit to London, and was introduced to the Garrick Club, where she was told by Sir Joshua Reynolds, and the best literary society of London. During this period of her life she wrote two tales in verse, and two tragedies, Percy and The Fatal Secret, both of which were acted. While in London she went a great deal into society, but gradually found this mode of life to be unsatis-
factory, and was led by her religious views to withdraw from it. After the publication of her *Sacred Dromas*, she retired to Cowlesip Green, a cottage near Bristol, where she did much to improve the condition of the poor in her neighbourhood by establishing schools for their instruction. She continued her literary work, and helped by her writings to raise the tone of English society. Her essays on *The Manners of the Great and The Religion of the Fashionable World* (a pamphlet on *Village Politics*), her novel *Caedes in Search of a Wife*, and a tract called *The Shepherd of Saturn* are some of the most popular of her works. In 1828 she moved from Barry Wood, a house she had built for herself near Cowlesip Green, and took up her abode at Clifton, where she died, September 7, 1833. See the Life by Roberts (2 vols. 1838), and the short Life by Miss Yonge (1888).

More, Henry, one of the Cambridge Platonists, was born at Grantham in Lincolnshire in 1614. He was educated at Cambridge, revolted early against the Calvinism of his parents, and gave himself entirely to philosophy, especially to Plato and more particularly to the Neoplatonist writers. He took his Bachelor's degree in 1632, and in 1635 he enrolled fellow of his college. Here he remained all his life, nor could he be prevailed upon to accept church preferment. He lived in an atmosphere of unusual spiritual elevation, and exercised a great influence on the young men that gathered round him. Among his pupils was a young lady of family who became Viscountess Conway, and at whose seat of Bagley in Warwickshire More often stayed. This lady's sympathies with the mystic and the occult extended also to Van Helmont and Valentine Greatrakes, and she ultimately found rest among the Coletians. More's Christian instruction gradually gave place to hopeless mysticism and theosophy, and his successive works decline correspondingly in value. He died September 1, 1667, and was buried in the chapel of his college. His *Divine Dialogues* (1668) is a work of altogether unusual interest. At Cambridge he collected in 1675, his *Opera Philosophica* in 1678, See the Life by Richard Ward (1710), and Tulloch's *Rational Theology in England in the Seventeenth Century* (vol. ii. 1874).

More, Sir Thomas, was born in Milk Street, London, in 1478. His father, who subsequently became Sir John More, Justice of the Queen's Bench, was a man of no mean capacity and education, and enjoyed a high sense of parental responsibility. More received his first instruction in Latin, then the basis of all education, in one of the most famous English schools of the time—that of St Anthony, Threadneedle Street, London. In after-life More wrote Latin with all the facility, though not with the classical purity, of the best Italian scholars of the Revival of Learning. When he attained his fifteenth year his father, after the fashion of the time, placed him as page in the household of Archbishop Morton, to whose virtues More afterwards paid the highest tribute in his *Utopia*. Morton, on his side, formed the highest expectations of More, and was in the habit of saying to the nobles who dined with him: 'This child here waiting at the table, whosever shall live to see it, will make a Lear, and a Lear of the best.'

By Morton More was sent to Oxford, where the Renaissance was now represented by such men as Colet and Linacre, both of whom had travelled and studied in Italy. From Linacre he appears to have learned Greek, and from Colet he received a spiritual influence, which gave a direction to his whole life and opinions. From Colet More also learned those novel methods of biblical interpreta-
tion which Colet himself may have learned from Savonarola in Florence. By his acquaintance with the classics therefore, and by his enlightened views regarding the theology and the traditions of the church, More was emphatically a man of the new order. With the great majority of the students in Oxford (probably about 1498), he first met Erasmus at Vercelli, at once that they were in entire sympathy on all the deepest questions of the time.

It was his father's wish that he should follow the same profession as himself. Having completed his legal studies, Henry entered the Middle Temple and from Lincoln's Inn, he acted for three years as reader in Furnival's Inn. It marks the religious basis of More's character that he spent the next four years in the Charterhouse of London in 'devotion and prayer.' By his marriage with the eldest daughter of Mr Colte, a gentleman of Essex, he definitely made choice of a secular career. During the last years of Henry VII. he became under-sheriff of London and member of parliament, in which latter capacity he gave serious offence to the king by protesting against the excessive dowry demanded by Henry on behalf of the pensioner. He took his daughter's marriage with James IV. of Scotland.

On the accession of Henry VIII. (1509) a brilliant prospect was opened up to More. It was Henry's ambition to surround himself with men of genius and accomplishments; and More had by this time attained a level of capacity and learning. As ambassador on two occasions to the Low Countries he had also given proofs of his tact and capacity for business. More, however, had little inclination for public life, and it was only after much hesitation that he took service under Henry. Introduceed to the king through Wolsey, he rose rapidly in dignity and in the royal favour. He became Master of Requests (1514), Treasurer of the Exchequer (1521), and Chancellor of the Duchy of Lancaster (1525). For a time the king showed him every mark of personal attention—paying him unexpected visits at his house in Chelsea 'to be merry with him.' Congratulated on these marks of favour by his son-in-law Roper, More, who had divined Henry's real character from the first, replied: 'If my head would win him a castle in France it should not fail to be of some advantage to the House of Commons (1523). More, on the occasion of Wolsey's demand for a subsidy of which the House disapproved, received the great cardinal in a manner that made him exclaim: 'Would to God you had been at Rome, Mr More, when I made you speak to the pope. For then I should have enjoyed Henry's favour; and on two occasions was sent on missions of importance to Francis I. and the Emperor Charles V.

On the fall of Wolsey in 1529, More, against his own strongest wish, was appointed to the office of Lord Chancellor. Seeing from the first where the king's divorce from Catharine of Aragon must eventually lead, he knew that only one fate could be in store for himself. In the discharge of his office he displayed a primitive virtue and simplicity, being 'resentful of any man's injuries, yet ready and rich, and keep no doors shut from them.' The one stain on his character as judge is the harshness of his sentences for religious opinions. In passing such sentences More acted only in the spirit of the time; but in his *Utopia* he had shown the clearest perception of the pernicious effects of religious discord. The Utopians,' he says, 'put the unbeliever to no punishment, because that they be persuaded that it is in no man's power to believe what he list.' More sympathised with Colet and Erasmus in their desire for a more rational theology and for reform in local customs. More's desire was to reform like them, but like them also he had no promptings to break with the historic church. He could look only with
displeasure, therefore, on the successive steps which led Henry to the final schism from Rome. In 1461 the greater part of the territory was ceded by him and retired into private life. The disapproval of his policy by such a man as More could not be disregarded by Henry, and various attempts were made to win him over. Nothing, however, could shake the constancy of More, and his death came with the utmost weight and prejudice. The opportunity came in 1534. In that year Henry was declared head of the English Church; and More's steadfast refusal to recognise any other head of the church than the pope led to his sentence for high treason after a harsh imprisonment of six years. This did not stay his death, while it is one of the commonplaces of English history, strangely illustrates an inveterate habit of his nature—the disposition to jest with the most serious questions and on the most momentous occasions. As, on 7th July 1533, he mounted the scaffold he exclaimed to a bystander: 'Friend, help me up; when I come down again I can shift for myself;' and raising his head after it had been laid on the block, he bade the executioner stay till he had put aside his beard, 'for,' said he, 'it never committed treason.' He was twice married; but only by his first wife had he any family. In no life of More should his daughter Margaret, the wife of his biographer Roper, pass unmentioned. By her high character and accomplishments, and above all by her pious devotion to her father, she holds a place among the illustrious women of English history.

One of the distinguished characters in the political history of England, More also ranks high in the history of its literature. By his Latin Utopia (1516; Eng. trans. 1536) he takes his place with the most eminent humanists of the Renaissance and is ranked as an literary Englishman of the 16th century well-known and admired on the Continent. In his History of King Richard III. (1513) he produced what may be regarded as the first book in classical English prose. In his personal character More was the most attractive and lovable of men; and his tragic end gave the crown to the moral beauty of his life. From Erasmus's sketch of him we realise all his virtues and all his attractions; but realise also that he was a winning rather than an imposing figure. He had ingenuity rather than insight; was infrequently his wit carried into levity and his flippancy; and there was in his character a strain of morbidity and superstition which precluded him from the largest humanest views of men and things. In 1536 he was beheaded.

See Roper, Life of Sir Thomas More (first printed 1529); Lord Campbell, Lives of the Chancellors; Mackintosh, Lardner's Cabinet Encyclopaedia; Seebolt, Oxford Reformers; D. Nicoll, Renaissance et Réforme; Utopia by Lupton (1895) and Michelet (1866); Lives of Father Bridge (1818) and W. H.utton (1885); also works cited at Henry VIII, Wolsey, Erasmus, and Fisher.

Moren, the medieval and modern name for the Peloponnese (q.v.), in southern Greece, said to be derived from moros, 'a mulberry'-the outline of the peninsula bearing a resemblance to the leaf of that tree; others, however, such as Pallmeray, trace it back to the Slavonic morie, 'the sea', while the Massalian More, after being overrun by the Goths and Vandals, it became a prey, in the second half of the 8th century, to Slav invaders, who were gradually subdued and civilised by the Byzantine emperors. In 1205 the peninsula was conquered by the Normans, who formed in the western feudal system a feudatory subject to the crown of Sicily. Michael VIII, Palaeologus reconquered the country after 1261; but the principality of Achaia remained in the family of Villehardon until 1346, when the male line became extinct. Various claimants now arose, and much strife and confusion ensued. At length, in 1461, the greater portion of the Morea fell into the hands of the Turks, the remainder being held by Venice, who abandoned it in 1540. Venice reconquered the Morea in 1684, but again lost it to the Turks in 1714. For its later history, see Greece.

Moreau, Jean Victor, the greatest general of the French Republic, except Bonaparte, was born, 11th August 1764, at Morlaix, in Brittany, son of an advocate, and was sent to study law at Rennes. On the outbreak of the Revolution he was chosen to command the volunteers from Rennes, served under Dumouriez in 1793, and displayed such military talent that in 1796 he made a general on his division in reducing Belgium and Holland under Pichegru in that and the following year. When Pichegru fell under suspicion, the Directory appointed Moreau, in the spring of 1796, to the chief command on the Rhine and Moselle. He crossed the Rhine at Kehl, defeated the Austrians and occupied the Ardennes, and drove the Austrians back to the Danube. But, owing to the defeat and retreat of Jourdan, he was obliged to make a desperate effort to regain the Rhine, which he accomplished, notwithstanding great difficulties, and a retreat was established to the Rhine, gaining a reputation for generalship more than all his previous victories. A suspicion of participation in the plots of Pichegru led to his being deprived of his command after the coup d'état of 18th Fructidor. In the following year (1798) he succeeded Schérer in the command of the army in Italy, which was hard pressed by the Russians and Austrians. By a retreat conducted with consummate skill, he saved the French army from destruction. The Directory, nevertheless, deprived him of the chief command, and gave it to Jourdan. But Moreau at once proposed to the army at Jomutel a request to be present at the battle of Novi. Early in the engagement Jomutel was killed and Moreau again assumed the command, and conducted the defeated troops to France. The noble disinterestedness of Moreau's character, his military talent, and his political moderation, induced the Directory to place him in command of Sisées, which overthrew the Directory, to offer him the dictatorship of France; he declined it, but lent his assistance to Bonaparte on 18th Brumaire. Receiving the command of the army of the Rhine, Moreau gained victory after victory over the Austrians in 1800, directing, as he did, a march behind the Inn, and at last won the great and decisive battle of Hohenlinden (q.v.). A strong feeling of jealousy against Moreau now took firm root in Napoleon's mind. He accused his rival of participation in the plot of Cadoudal (q.v.) and Pichegru against his life, had him arrested, brought to trial, and found guilty on insufficient evidence, 9th June 1804. A sentence of two years' imprisonment was pronounced; Napoleon commuted it into banishment, and Moreau went to America, and settled in New Jersey. There he remained until 1815, when he took up the cause of the emperor of Russia and the king of Prussia in the march against Dresden. Fortunately for his fame he did not live to invade his country, for here, as he stood talking to the Emperor Alexander on 27th August, a French cannon-ball broke both his legs. Amputation was performed by the Emperor, 24 September 1813. He was buried in St Petersburg. See the studies by C. Jochmus (Berl. 1814) and A. de Beachamp (trans. Lond. 1814).

Morecambe Bay, an inlet of the Irish Sea, separates the main portion of Lancashire from the detached portion of Furness. It is about 10 miles in average breadth and 18 miles in length, and
receives the Leven, the Kent, and the Lune. The depth of water in the bay is never great except in the channels of the rivers.

Moreen. See MORE.

Morel (Morechella) is a genus of Discomycete fungi, of which a number of species (M. esculetum, deliciosus, bohemica, &c.) are commonly eaten fresh and preserved in central and southern Europe. In Germany the morel is so highly prized that, as it often springs up where trees have been burned, the forests were often destroyed for its sake, till this had to be restrained by severe penalties.

Morelia, capital of the Mexican state of Michoacan, is situated, among gardens and orchards, in a valley 6400 feet above sea-level, 115 miles (234 by rail) W. by N. of Mexico-city. It contains a cathedral and seminary, and manufactures cotton, tobacco, and candles. Morelia, which from 1541 to 1828 was called Vallalobido, was the birthplace of the patriot Morelos, in whose honour the name was changed, and of Turibide, the short-lived emperor of Mexico (1821). 27,000.

Morella, a town of Spain, 80 miles N. by E. of Valencia, was the stronghold of Cabrera, the Carlist general, who sealed the castle on 25th January 1839. It was retaken in July 1840 by Espartero. Pop. 7100.

Morena. See PODARGUS.

Morerl, Louis (1843–90), was born in Provence, and for five years was a noted preacher at Lyons, where in 1874 he published Le Grand Dictionnaire Historique, ou le Melange Curieux de l'Histoire sacree et profane (in 1 vol. folio). In 1875 he went to Paris, and laboured at the expansion and improvement of this important work till his death. The best editions are: 3rd (Paris, 1879), in 10 vols. folio. It was translated into Spanish, Italian, and English, Jeremy Collier adding to this an appendix or supplement filling a folio volume. The geographical and historical articles have become obsolete, but the biographical part is still valuable.

Moresnet, a small neutral territory between Belgium and Prussia, 5 miles SW. of Aix-la-Chapelle, and containing about 70 acres. There is on it a village of 3000 inhabitants.

Moreton Bay, on the east coast of Queensland, Australia, is formed inside the islands of Moreton and Stradbroke, the former 29 miles and the latter 33 miles in length, and both about 5 miles in greatest breadth. The bay is 40 miles long by 17 broad; its southern half is dotted with islands and sandbanks. It receives the six considerable streams, Nerang, Finchpama, Logan, Brisbane, Pine, and Caboolture. The entrance at the north end is practicable at all times for vessels of the largest size; the entrance between Moreton and Stradbroke Islands is narrow, and less safe.

Moreton-bay Chestnut, a genus of plants so named because of the supposed resemblance in form and qualities of the seeds to the sweet chestnut of Europe. Castaneaequam unistrate is the only species of the genus known. It belongs to the sub-order Papilionaceae of the natural order Leguminoseae, and is a native of Queensland, Australia. The tree grows to the height of from 70 to 90 feet, with spreading branches clothed with pinnate leaves. Its fruits, called "chestnuts," are used as a substitute for almonds. Though likened to the sweet chestnut, they are much inferior in delicacy of flavour, being very astringent; but they are somewhat improved when roasted.

Morgan, G. R. (1862–1771), founder of pathological anatomy and professor at Padua. See ANATOMY.

Morgan, Mount. See MOUNT MORGAN.

Morgan, Augustus De. See DE MORGAN.

Morgan, J. C. Hiteheson, Sir Henry Morgan (1890), and Howard Pyle, The Buccaneers and Marooners of America (1891).

Morgan, Lady, novelist, was born (Sydney Owenson) in Dublin on the Christmas-day of 1780 and there—by the "mere chance of chronological dates"—she protests against. Her father, a theatrical manager, fell into difficulties; and the clever, bold, lively young woman resolved to support the fortunes of the family, first as governess, afterwards as author. She had had "somewhat mysterious relations with at least one admirer, Sir Charles Ormsby, when in 1812 she was married off-hand to Thomas Charles Morgan, M. D. (1783–1843), whom the Lord-lieutenant knighted for the occasion. For the next quarter of a century, excepting two long visits to Spain, he remained in London, or in the vicinity of it; but in 1857 Lord Melbourne gave her a pension of £300, and next year they removed to London. Here she died on 16th April 1859, having continued busy with her pen and her tongue to the last. Her twenty-two works—rattling novels, verse, travel—include a novel, The Wild Irish Girl (1806), O'Donnell (1814), France (1817), and Italy (1821). Her silly but unamusing Memoirs were edited by Hepworth Dixon (2 vols. 1862).

Morgan, Lewis Henry, an American archaeologist, was born at Aurora, New York, 21st November 1818, graduated at Union College in 1840, and became a lawyer at Rochester. He served in the state assembly (1861) and senate (1868), and died December 17, 1881. Morgan's earliest work, The League of the Iroquois (1851), was the first account of the organization and government of an Indian tribe; but even more valuable are his Systems of Consanguinity and Affinity of the Human Family (1869), and his treatise on Ancient Society (1877). He also published Houses and House-life of the American Aborigines (1881), and an account of the beaver.

Morgan, Fata. See FATA MORGANA.

Morganatic Marriage (perhaps from Goth. morgunig, "to limit;" perhaps Ger. morgengut, a gift given to the husband to the wife after marriage; Littre suggests morgan, "morning"—a wedding celebrated privately in the morning), sometimes called left-handed marriage, a lower sort of matrimonial union, which as a civil engagement is completely binding, but fails to confer on the wife the title or fortune of her husband, or on the children the full status of legitimacy or right of succession. In Germany it came in very early times to be accepted as a principle that Ehenbürgkeit, or equality of birth between husband and wife, was essential to a proper marriage. The lower nobility were of course not Ebenbürgtig with the higher nobility, nor the best born commoners with the lower nobility. Now the rule only concerns reigning houses and the higher nobility. But still members of German princely houses entering into marriage with people of this kind with their inferiors in rank (as frequently happens) contract merely morganatic unions. The marriage, for instance, in 1851 of Prince Alexander of Hesse to the Countess Julie von Hauke, from which sprang the Battenberg family, was a morganatic act (Hanse, p. 189). The Royal Marriage Act, 12 Geo. III. chap. 11, reduces to a position somewhat like that of morganatic unions...
every marriage in the royal family of Great Britain not previously approved by the sovereign under the Great Seal, provided the prince entering into it is under twenty-five, and every such marriage of a prince above twenty-five which is not approved by parliament. This, the peragres and most biography books make mention of the Duke of Cambridge’s marriage with Miss Farebrother, an actress (died 1809); their children bear the name of Fitzgeorge. See ROYAL FAMILY.

Morgarten, a mountain slope on the east margin of Lake Egeri, in the canton of Zug, Switzerland, where 1400 men of the Swizer Forest Cantons—Swyz, Uri, and Unterwalden—won a great victory over 15,000 Austrians, November 15, 1315.

Morgheu, Raphael Sanzio Cavaliere, a famous engraver, was born at Naples, June 19, 1758. His first instructor was his father, a medico engraver of German origin. But he gave such indications of talent that at the age of twenty he was sent to Rome to study under Volpato, then considered the best engraver in Italy, whose daughter he married in 1781. His progress was very marked, and even his first works obtain critical approbation. Raphael’s celebrated figures in the Vatican of ‘Poetry’ and ‘Theology,’ were engraved by him in 1781; and he afterwards produced a succession of engravings of a very high class from many of the masterpieces of art amongst the treasures of this celebrated gallery. Not the least merits of this artist are the admirable skill with which he copied and modernized figures of masters of the past. He died at Florence, August 4, 1833. His Life, with a portrait and catalogue of his works to the number of 254, was published by his pupil, Niccolo Massimo Palmarino. The success of Morghe’s works enabled him to live in comfort, and he is one of the most prominent in the history of Engraving (q.v.). See Fed. R. Halsey, Raphael Morgheus Engraved Works (New York, 1885).

Morgue, a building in Paris, just behind the cathedral of Notre Dame, where the dead bodies of persons unknown, found either in the river (Seine) or in the streets, are exposed to public view for three days. The corpses are put under a glass case, on sloping slabs of marble. When a corpse is identified, it is handed over to the relatives or friends of the deceased, on payment of costs and dues; otherwise it is interred at the expense of the nearest relative or legal heir. The number of bodies yearly exhibited in the Morgue is about 300, of which five-sixths are those of males.—There are morgues in Berlin, and in Boston, New York, Brooklyn, Philadelphia, Chilgino, and other American towns.

Moriah. MOUNT. See JERUSALEM.

Morier, JAMES, an English novelist, born in 1790, served from 1810 to 1814 in the court of Persia as secretary of legation, subsequently as envoy. In 1812 he published his Travels in Persia, Armenia, and Asia Minor to Constanti-nople, and in 1818 A second Journey through Persia, Armenia, and Asia Minor. The minute and familiar acquaintance he had acquired with the manners and customs of the Persians was seen in his highly interesting series of eastern romances.

The Adventures of Hajji Baba of Ispahan (3 vols. 1824), with its continuation, Hajji Baba in England (2 vols. 1828); A Journey to the Mirza (1841). His other novels are Abel Annut (1857), The Banished (1839), and Martin Toutroud (1842). Morier died at Brighton 19th March 1849.

Morinus. Jean Morin, a French theologian (1591-1659), wrote on ecclesiastical antiques, and ranks as one of the best pupils and admirers of Rambaud (1545-1649) in this line. He wrote in 1639 a treatise on the Samaritan Pentateuch and the Targum (in the Paris Polyglott), and his Exercitations on the Hebrew and Greek text of the Bible.

Morion, an iron or steel headpiece without visor. See ARMOUR.

Moriscos, the name usually given to the Moors who remained in Spain after the taking of Granada in 1492, Mozarabs or Moorishized Spaniards, to the Christian Spaniards who lived in the parts of Spain under Moorish rule; Mudejares, to the Moors who submitted to the Christians in the earlier periods of the reconquest.

To take first the Mozarabs. Christianity was freely, if contemptuously, tolerated by the Moorish kings. The professional outbursts of fanaticism seemed to take place. These were often provoked by Christians defiantly seeking martyrdom, as in Cordova in the 9th century; this persecution lasted intermittently till 683, when it well-nigh ceased. The Mozarabs kept their ancient liturgy, though many of them had ceased to understand Latin, and spoke and wrote Arabic only, writing even Latin and Spanish with Arabic characters. They occasionally held councils, but indifference prevailed, and the Spanish conquerors were more astonished at the laxity of the Mozarabs than at the constancy in the practice of their old faith. For Mozarab literature, see LITURGY.

Mudejares.—Moorish names appear first in the 9th century as inhabitants of the country, and witnesses to documents, under Spanish rule. One of the earliest capitulations, which a Moorish king granted to them is that of Huesca (1061); by this and subsequent fueros (Tudela, 1115, &c.) the widest toleration was extended to them; they were allowed full exercise of their religion, laws, language, dress, and customs. The fuero of Nativa granted by Jaime I. of Aragon (1231) provided that if any Saracen, however deeply converted, ever became a Christian he should lose his landed property; that of Siliebar, near Seville (1255), allows them to build a castle for their defence. These capitulations seem to have been fairly observed till the 14th century, when a change of tone becomes apparent. In 1301 the Moors of Aragon were compelled to wear a distinctive dress, and in the next century their privileges were greatly curtailed; resettlement was forced upon them. The Mudejares of Aragon, Valencia, and Castile had hitherto been faithful, had served loyally in war even against Moors, and taken the royal side in all popular movements; even as late as 1238 they appealed to their well-proved loyalty to the crown. But their situation was greatly impaired by the incorporation among them of the Moriscos, after the fall of Granada (1492). The terms of the capitulation of 1492, under which the Mudejares had lived loyally in Aragon, Valencia, and Castile for three or four centuries. Under Tahavera, the first Archbishop of Granada, some attempt was made to observe these conditions, and to furnish them with happy results. But the intrigues of Cardinal Ximenez, violating the capitulations, led to a rising in the Alpujarras (1500-2) and to the expulsion of the Moriscos of Castile and Leon; though in 1503 and in 1510
MORLAND

Cattilla, Condicion Gitcrra profe.'isor Spaniards 1599 Brest. every Poiitico the: it the pigs, iiirinciple French Blois as fruitless diminish'd. charge the their number's increase'd. conversion firmly to rest, men taken of objects objects. Those who chose exile to were given to the soldiers as slaves, and the rest, who were exempted, were sent to Castile, Valencia, and Murcia. The action of the Corsairs, avenging on Spain the wrongs of their fellow-countrymen, ruining the commerce, carrying off Christian captives, ravaging the coasts so that for leagues along the south-east it remained uncultivated, impressed a bitter melancholy on the Moriscos, who were suspected of being in league with the Corsairs, and directing their forays. Many returned openly to their ancestral faith; spasmodic attempts at genuine conversion proved fruitless; in 1599 the Archibishop of Valencia reported one Morisco in every house as the result of a year's labour. Harder measures were tried and failed; persecution only made them cline more firmly to their faith; partial expulsion only augmented the number of the Corsairs; and at last they were forbidden to leave the country by sea. The hatred, however, of Philip II. against the Protestants was stronger than his dislike of the Moriscos, and his reign is marked by constant visitations in his policy towards them; and their lot cannot have been absolutely intolerable, for one charge of heresy was enough to cause a person's number to increase continually while that of the old Christians diminished. The fear and suspicion aroused on both sides made it difficult for Spaniards and Moriscos, new and old Christians, to live together. After so many breaches of faith the Moriscos could trust no formality, and they were now free to engage in commerce. To the Spaniards it seemed intolerable to have an intestine foe, while the kingdom was so sorely pressed from without; and churchmen taught the king that anything, short of the extermination which he might commit with a safe conscience, was a mercy. In 1582 the total expulsion was first mooted; it was decided on in principle in 1599. In 1609-10 the whole of the Moriscos were expelled the kingdom, either by sea from Valencia, or through the Pyrenees from Aragon and Castile. All their goods were confiscated, except what they could turn into money, or carry with them as in their persons; robbery, murder, assault, excesses of every kind against them marked their track; all their children under four years of age were taken from them to be brought up as Christians; over 50,000 Moriscos, including labourers or farmers, left the country in which they had always dwelt for so many centuries. The results to Spain were like those which subsequently followed the emigration of the Huguenots from France. Even this does not end the story; the descendants of the chief of these Moriscos were ruthlessly massacred; others were driven to seek shelter and protection in Algiers; and some, after being converted to Christianity, were regarded with horror, and were constantly denounced to the Inquisition. For nearly a century afterwards we find decrees of particular provinces expelling families for being descendants of the Moriscos. A taint of Moorish blood was sufficient to prevent the holding of any public office, even in the smallest municipality.

Moriah, JAMES COTTER, author and Positivist, was born in 1832, and educated at Highgate grammar-school and Lincoln College, Oxford. His first work was his masterpiece, The Life and Times of St Bernard (1863). His latest, The Service of Man, an Essay towards the Religion of the Future (1886), attracted much attention, but it was commenced when sickness had already seized him. The illness does not appear to have checked his views. He was one of the founders and first proprietors of the Fortnightly Review. His intellectual gifts were associated with a most genial and kindly nature; he was reputed one of the best talkers of his time in French as well as English, and had been praised as the most witty friend the history of France, but owing to ill-health it was never fairly begun. He died February 25, 1888.

Morison, ROBERT, botanist, was a native of Aberdeen, born in 1620. Having borne arms as a royalist in the civil wars, he retired to France when his sovereign's cause collapsed, and took the degree of doctor at Angers (1648). Two years later he became superintendent of the gardens of France, but owing to ill-health it was never fairly begun. He died February 25, 1888.

Morison, MORLY, painter, was born in London, 26th June 1763, the eldest son of Henry Morland, engraver (1712-57), to whom at fourteen he was articled for seven years, and who brought him up with extreme rigour. No sooner, then, had he become his own master than he went hopelessly and utterly to the bad. His marriage in 1786 had no power to check him; and his whole after-life was a downward course of debt and dissolution. He was regular only in this, that 'every day he got thoroughly intoxicated, and then generally would lie all night. Yet he worked hard and rapidly, in the last eight years of his life turning out nearly nine hundred paintings and more than a thousand drawings. His strength lay in country subjects (pigs, Gypsies, and stable interiors); his sea-pieces, though numerous, are of small account. He died of brain-fever in a Holborn spunging-house, 27th Oct. 1804. See Lives by Dawe (1807) and Richardson (1865).

See Lives by Dawe (1807) and Richardson (1865).
Morley, a municipal borough in the West Riding of Yorkshire, 5 miles SW. of Leeds, with woolen manufactures, and many stone quarries. Mentioned in Domesday, it became a borough only in 1835. Pop. (1881) 15,011; (1891) 18,725.

Morley, Henry, English author, was born in London, September 15, 1822, and educated at the Moravian School, Newfield-on-the-Rhine, and King's College, London, where he edited the King's College Magazine. After practising medicine at Manchester, Salford, and Liverpool (1844-46), he settled down with some reluctance in London to literary work in connection with Household Words and the Examinier. Of the latter he was joint-editor from 1856 to 1859, and sole editor from 1865 to 1866. In 1866 he was lecturer at King's College for eight years previous to 1885, when he became professor of English Language and Literature at University College, London, an office which he resigned in 1889. In 1889 he contributed the article on English Literature to this work. In 1870 he examined for the University of London, in English Language, Literature, and History to the university of London. His numerous writings include How to make Home Unhealthy (1856): A Defence of Ignorance (1856); Lives of Vallisay (1862), Jerome Carus (1863), and Agrippa (1856); Memoirs of Bartholomew Fair (1857), revised in his essay in Household Words; two volumes of Fairy Tales (1859-60); English Writers to Dunbar (2 parts, 1864-66), worked upon up into the first 4 vols. of a projected complete history of English literature in 20 volumes); and an annotated editior of the Spectator (1868) and Boswell's Life of Johnson (1880); Tables of English Language (1870); Clément Marot and other Studies (1871); A First Sketch of English Language (1873); Library of English Literature (5 vols. 1876-82); and Of English Literature in the Reign of Victoria (1881). No man has done so much to make classical literature (both English and foreign through English translations) accessible to the people as Henry Morley through his admirable series, Morley's Universal Library (65 volumes at a shilling each, 1863); his Life of Shakespeare (299 volumes at threepence each, 1886-90); and the Caribooke Library, a series of half-crown volumes (1888 et seq.). He died 14th May 1894. See Life by H. S. Solly (1898).

Morley, John, M.P., was born at Blackburn, 24th December 1838; he was educated at Cheltenham and Lincoln College, Oxford, and, after taking his degree, he was called to the bar, but chose literature as a profession. The best known of his books are Edmund Burke (1867), Critical Miscellanies (1871 and 1877), Voltaire (1872), On Compromise (1874), Rousseau (1876), Disraeli and the Encyclopaedists (1878), Bernard Cobo (1881). From 1867 to 1882 he edited the Fortnightly Review; and he has edited the English Men of Letters' series. He is an honorary LL.D. of Glasgow. Though possessing great literary faculty and power of phrase, Mr Morley's desire has not been merely to write a readable book, but to transmit knowledge, but always to make character stronger and deeper. He seems oppressed by the triviality of life; he feels that only the best is worth an effort, but that this is worth all effort, while indifferenee and insincerity of action are the greatest curses of mankind. In politics he has been throughout life a pronounced Radical, and in religious questions he has long stood far apart from the great majority of his countrymen.

Mormons. He unsuccessfully contested Blackburn in 1885, and Westminster in 1889. From 1890 to 1893, when he was elected for Newcastle-on-Tyne, Mr Morley was editor of the Pall Mall Gazette. His articles on various subjects, and many short pamphlets, were published in 1885, and were followed by action in the House of Commons and speeches in the country in 1886, did much to influence public opinion before Mr Gladstone's change of policy was known. In 1886 he became Irish Secretary till the dissolution which followed the rejection of the Home Rule Bill, and that year he was thrown into great difficulty as to the leadership of the Irish party, he directly supported Mr Gladstone. As a speaker Mr Morley has certainly succeeded in the country; he has few of the superficial gifts of an orator, but he never fails to convey to a public audience an irresistible-bright perception of everyday life and experience, which has given him a personal hold on men's minds. Though not an advocate of state interference, he wishes politics to be regarded as a means for raising the oppressed, and elevating national character. His political opponents say that Mr Morley is a man of letters, more fitted to write history than to make it, but seized with a perversc desire to be a politician; and doubt whether his earnest courage is matched by penetrating insight into the affairs of the moment and the quickness of decision essential to the highest success in public life. His opposition to the measure culminated in the Eights Hours Bill, which lost him his popularity and his seat at Newcastle in 1895. In 1896 he was elected for the Montrose Burghs. He took a somewhat less conspicuous part in public affairs, but strongly opposed the new Soudan expeditions. His Studies in Literature appeared in 1891; his Remains lecture on Machiavel in 1897. In 1898 he was selected to write Mr Gladstone's Life. See the Review of Reviews for December 1890.

Morley, Samuel, born in Hornerton, October 15, 1806, entered his father's hosiery warehouse, and shared with a brother the chief responsibility from 1840 till 1854, when he became the head of the concern. He was returned to parliament for Nottingham, in the Liberal interest, in 1865; was unseated on petition; represented Bristol in 1868-85, and declined a peerage. Identified with many religious and philanthropic movements, he gave £2000 towards the erection of a Congregational memorial hall, and during 1864-70 contributed £14,000 towards the erection of Congregational chapels. He died September 5, 1886. See Life by Hodder (1887).

Mormons, or, as they call themselves, the Church of Jesus Christ of Latter-day Saints, a religious organisation, the founder of which was Joseph Smith, who was born at Sharon, Vt., on 23rd December, 1805. He was the son of a farmer, and at the age of ten removed with his parents from the state of Vermont to Palymra, in the state of New York, and four years later to the neighbouring town of Manchester. It was here, according to his claim, that he received his religious revelation—his divine call as a prophet of the Most High, with no less authority and power than were vouched for by the ancient seers and prophets of biblical fame. Prior to this he had belonged to no religious body, but, being a young man of spiritual mind, with a leaning toward Methodism. He declared himself to be a revelation of the Father and the Son, of two persons of the Trinity, was vouchsafed to him. His second visitation from the unseen world was on the evening of 21st September 1823. A glorious personage appeared at his bedside, and, announcing himself as a messenger from the presence of God, 'called me by name and said unto me ... that God had a work for me to do, and that my name should be had for good and evil among all nations, kindreds, and tongues.' He said there
was a book deposited, written upon golden plates, giving an account of the former inhabitants of this continent, and the source from whence they sprung. He also said that the fullness of the everlasting gospel was contained in it, as delivered by the Saviour to the ancient inhabitants. Also, that the book was so composed in the plates, and the possession and use of these stones was what constituted seers in ancient or former times, and that God had prepared them for the purpose of translating the book. . . . While he was conversing with me also in the plates, the view of what I was reading that I could see the place where the plates were deposited, and that so clearly and distinctly that I knew the place again when I visited it.' This visitation was supple-
mented by others, the same angel appearing to him thrice that night, and afterwards visiting him, several visits and instructing him at length in relation to his prophetic mission. The spot where the records lay concealed was described as being 'on the west side of a hill, not far from the top, about 4 miles from Palmyra, in the county of Ontario, New York.' When Cowdery arrived there, its site was pointed out to him by a servant of Oliver Cowdery. David Whitmer, and Martin Harris, to the effect that an angel of God came down from heaven and showed them the plates from which Joseph Smith translated the Book of Mormon; and this was followed by the testimony of eight other witnesses, among them Joseph's father and two brothers, who affirmed that 'Joseph Smith, junior,' had shown them the golden plates containing the engravings. These were the only persons who were permitted to see them. They were returned to the angel after the work of trans-
lation was done. Only one sealed portion of the plates was translated, the sealed remainder being reserved, with a promise of translation at a future time.

These records contain the primitive history of America from Jerusalem about 600 B.C., and in time peopled both North and South America. The founders of the new colony were Lehi and his wife, his four sons Laman, Lemuel, Sam, and Nephi, with their wives; Zoram, a servant, and his wife; in all sixteen persons. They landed on what is now the coast of Chili, and, armed with bows and arrows and other weapons, began a truce of death quarrels broke out among the brothers. The Lord had appointed Nephi to be the ruler of the new race of colonists, but his jealous elder brothers rebelled, and were cursed by the Almighty for their iniquities, and condemned to have dark skins, this punishment as a type of the Crucifixion, awful earthquakes, darkness, and destruction announced that event. Shortly afterwards Christ himself appeared out of heaven to the more righteous Nephites. He showed them his wounded side and the print of the nails in his hands and feet, and blessed all his disciples. By the result of his gospel, healed the sick, blessed chil-
dren, administered the sacrament, chose twelve apostles, and gave them power to found his church with the same orders of priesthood, the same ordinances, gifts, powers, and blessings as in the Old World. After a prosperous and peaceful reign, the result of the spread of the work of Christ, which at one time was received by both Nephites and Lamanites, hostilities between the two races were resumed, gradually the purity of their faith declined, and finally, about the year 385 A.D., a decisive conflict, similar to that which had destroyed the Jaredites in the same locality, took place near the hill Cumorah, where the Nephites were almost totally annihilated. The Lamanites remained a dark and oppressed race, to people the waste of the Old World with a mixture of customs and traditions the story of the illustrious past. Shortly before the battle of Cumorah, a Nephite prophet named Mormon had been commissioned of God to write an abridgment of the history of his people, from the records kept by their various prophets and rulers, to be hidden in the earth till God should see fit to bring it forth and 'unite it with the Bible for the accom-
plishment of his purposes in the last days.' This abridgment, written upon golden plates, was con-
sealed in the hill by Moroni, a son of Mormon, and one of the survivors of the battle of Cumorah. He who was appointed as an angel to Joseph Smith and told him where the plates were deposited. Such is the famous Book of Mormon, believed by the Latter-day Saints (hence called Mormons and Mormonites) to be of equal authority with the Jewish and Christian scriptures, and to form an indispensable supplement to them, containing God's revelations to the New, as the others to the Old World.

The work being published, attention was speedily drawn to it. The opponents of the Saints alleged that it was made up from a romance written by a quondam clergyman named Solomon Spaulding (1761-1816). This the Mormons emphatically deny, and the discovery of the original MS. of that romance by Dr. E. D. Caster, of Ohio College, 1844, corroborates their denial. Un-
deterred by ridicule and hostility, the Mormon prophet and his associates declared that the
The object of which was to relieve the wants of their afflicted brethren who had been driven from their homes in Missouri, and to promote a reconciliation between them and their former neighbors. They purchased lands in Caldwell county, Missouri, where they settled and founded the city of Far West. At Kirtland on February 14, 1833, the Twelve Apostles of the church were chosen, and soon after the council of the Seventies, their co-labourers in the ministry, was called into existence, and sent forth with the apostles to begin the work of "pruning the Lord's vineyard for the last time."

In June 1837 Heber C. Kimball, Orson Hyde, Willard Richards, Joseph F. Smith, and others left Kirtland for England, and landed at Liverpool, July 20. Three days later they began preaching in Preston, and met with such remarkable success that within the next eight months, at the expiration of which time Kimball and Hyde returned to America, they had converted and baptized about 2000 people. The British mission was the first foreign mission of the Mormon Church.

On account of apostasy and persecution Kirtland was now pretty much abandoned by the Saints, the main body of them with the prophet and other leading members moving to and settling in the new city of Nauvoo, or "Zion" in Missouri. They settled in Caldwell, Daviess, Clinton, Carroll, and Ray counties, where they bought land and improved it. At Far West, Caldwell county, the corner-stone of a temple was laid, a printing-office was established, and a monthly paper, called The Elder's Journal, published. But an election riot in August 1838, in Gallatin, Daviess county, where attempts were made to prevent the Mormons from voting, and some of them were obliged to defend themselves against assailants, was made the pretext for further acts of violence and disturbance, from which the Saints in the outlying settlements were sufferers. The mob even burned the houses and laid waste the property of some of their own sympathizers in order to make it appear the work of the Mormons, who were falsely accused of deeds similar to those of which they were the victims. The result was a general uprising. The militia of the state was called out to suppress the riots, but took side with the mob against the unpopular Mormons. Governor Boggs issued an order for them to be 'exterminated or driven from the state,' and commanded Major-general Clark with seven thousand men to proceed at once to Far West and execute the decree. To this overwhelming force the inhabitants of the city peaceably surrendered, though compelled to look on and see their city sacked and pillaged, their wives and daughters outraged and insulted, and a number of their brethren killed by the mob and the soldiery. The Mormon leader and about seventy others were retained as prisoners, and the body of their followers, on penalty of death, ordered to leave the state forthwith. From twelve to fifteen thousand people in the autumn and winter of 1838 crossed the Mississippi, and this mob moved largely in the western part of the state of Illinois. Joseph Smith and the other prisoners were tried by court-martial (November 1) and condemned to be shot, but escaped execution.

The Mormon prophet next rallied his people on the banks of the Mississippi, principally at or near Commerce, and there, in 1839, purchased a large tract of land, and immediately commenced his propagandist labours with great success. In June 1833 the building of a temple in Kirtland was commenced. Shortly afterwards a printing-press was established in the city, and Oliver Cowdery recommended the publication of the Evening and Morning Star, and in July 1834 it was visited for the third time his people in Missouri. He was accompanied by 204 persons, mostly young men. This was the 'Zion's Camp' expedition, the

millennium was nigh at hand, that the Indians would soon be converted, and that the new Jerusalem, the Zion of the last days, should be situated in that part of the world where the Messiah would gather to prepare for the coming of the Lord in his glory, was to be built in the heart of the American continent. America, they claimed, was the land of Joseph, bestowed upon him and his posterity for ever by the blessing of the patriarch Jacob, as revealed to him in Genesis and Leviticus. The prophet's house was frequently beset by mobs and 'evil-designing persons;' several times he was shot at and very narrowly escaped; but his courage and zeal continued to bring him disciples, and on April 6, 1830, the Church of Jesus Christ of Latter-day Saints was legally organized, with six members, at the house of Peter Whitmer, in Fayette, Seneca county, New York. Several months prior to this the Arcanum priesthood, restored by an angel who said that he was John the Baptist, was conferred upon Joseph Smith and Oliver Cowdery, and later they were ordained to the McElheneck priesthood by the apostles Peter, James, and John. The new religion spread rapidly and gained many converts. Branches of the church were established in New York, Pennsylvania, Ohio, the British provinces, and other lands. The prophet was fiercely attacked by the leaders and preachers of the other religious denominations, but held his ground firmly. Though but poorly educated, he was a formidable opponent in the polemical field. In January 1831, in compliance with revelation, the church removed westward and established its headquarters at Kirtland, Ohio, where it began to thrive amazingly. In the summer of 1831 a colony from Kirtland migrated to Missouri, where they purchased lands in Jackson county, which had been revealed to the Mormon prophet as the chosen site for the city of Zion. At a place called Independence his colonists concentrated themselves, established a printing-press, started a monthly periodical, the Evening and Morning Star, and continued to preach zealously and make proselytes to their faith. Their success and rapid increase here, as elsewhere, raised up enemies. Secret societies were formed to expel them from Missouri, their houses were attacked by mobs, their periodicals were stopped, their printing-press confiscated, their bishop tarred and feathered, and numberless other outrages committed. Finally, in November 1833, the entire community, numbering about 1500 souls, were driven from their homes, whipped, plundered, many of them killed, and the survivors expelled from Jackson and scattered through the adjoining counties. The main body of the refugees found a resting place and kindly welcome in Clay county.

Meanwhile the Saints in Ohio had suffered some persecution. On the night of March 5, 1832, at Hiram, Portage county, a mob broke into a house where the prophet was sleeping, tore him from the arms of his wife, and dragged him to the printing-office where he was tarred and feathered, and forced to eat aqua fortis in his mouth. Sidney Rigdon, his associate, was similarly handled and rendered temporarily insane. Later on Smith was assailed by divers vexations prosecutions, but each time came off victorious. He set up a printing-press at Kirtland, and continued his propagandist labours with great success. In June 1833 the building of a temple in Kirtland was commenced. Shortly afterwards a printing-press was established in the city, and Oliver Cowdery recommended the publication of the Evening and Morning Star, and in July 1834 it was visited for the third time his people in Missouri. He was accompanied by 204 persons, mostly young men. This was the 'Zion's Camp' expedition, the
their head, had preached a wonderfully successful mission in the British Isles, whence they sent many hundreds of converts across the Atlantic. Within five years the Mormons numbered in Illinois about 20,000 souls.

After a few years of comparative peace and pros-
perous existence, a new stormburst upon the Mormon community. Governor Ford ordered into service several hundred men, had Joseph Smith arrested with his brother Hyrum, and immersed in Carthage gaol, Willard Richards and John Taylor accompanying them. In the afternoon of June 27, 1844, though some 250 Utah men had already broke into the gaol and shot the two brothers Smith dead, also severely wounding John Taylor. The assassins were never brought to justice. Mor-
monism was now thought to be doomed, but under the leadership of Brigham Young it survived the shock of its prophet's martyrdom: "the blood of the martyrs proved, as ever, to be the seed of the church." But the anti-Mormons were determined on the removal of the entire community of Latter-day Saints from the state, and the Mormon leaders, seeing no alternative but to comply with this de-
mand, a picking list of pious, loyal and able men, under the supervision of Missouri, finally resolved once more to abandon their homes, and seek a haven of peace and safety in or beyond the Rocky Mountains. Accord-
ingly, on 1st February 1846 a thousand families left Nauvoo and descended on the Mississippi ice. At Council Bluffs, on the Missouri River, in the month of July 1846, Captain J. L. Allen of the United States army called on the Mormons to raise a battalion for service in the Mexican war. The exiles speedily raised the five hundred troops re-
quired, though it took nearly all their able-bodied

men. The families left at Council Bluffs, unable in the absence of the battalion to proceed farther that season, crossed the Missouri and established Winter Quarters, now Florence, Nebraska. Mean-
while the residue of the community left behind in Nauvoo, after a gallant defence of their city and the mob against the mob, which in violation of treaty came upon them in overwhelming numbers, were expelled from their homes and thrown shelterless upon the western shore of the Mississippi.

In the spring of 1847 Brigham Young at the head of 130 men, 25 women, and 3 children, started from Winter Quarters for the Rocky Mountains. They arrived in the valley of the Great Salt Lake, the site of their present beautiful city, on July 24, and began to plough the ground and put in crops the same day. Seven hundred more arrived in a few weeks, and 1000 wagons in the autumn of 1848. In December 1847 Brigham Young was chosen president of the church—an office left vacant since the death of Joseph Smith—with Heber C. Kimball and Willard Richards as his counselors in the First Presidency. In 1849 the provisional government became the state of Deseret was organised at Great Salt Lake City, a state constitution adopted, and a delegate sent to congress to ask for admission into the Union. The petition was refused, but in September 1850 Congress granted Utah a territory, and President Fillmore appointed Brigham Young governor, which office he held from 3rd February 1851 until 11th April 1858, when he was succeeded in that office by Alfred Cumming. In 1857 the Mormons were falsely charged with being in a state of rebellion, and President Buchanan sent a considerable military force to Utah. Young and his people fearing military ex-

cesses, and remembering the fate of Far West and Nauvoo, kept the army east of the Wasatch Moun-
tains until the next spring, when arrangements were made for the peaceful entry of the troops, the Mormons having abandoned their city and surrounding parts and removed south, with the avowed determination of burning every building and reducing Utah to its former condition of barren-
ness if vindictively pursued. They were not, how-
ever, molested. The troops passed quietly through the city and encamped in Cedar Valley, about 40 miles south west of Salt Lake City, in the homes. Since then their cities and settlements have extended from Idaho through Utah into Wyoming, Colorado, Nevada, Arizona, New and Old Mexico. The Mormons also have a settle-
ment in British America. In Utah they have three territories: Gough's Logan, Salt Lake, and a fourth, an imposing edifice, in Salt Lake City.

The Mormons have sent many missionaries to the British Isles and nearly every other European country, also to Australasia, Africa, Palestine, the East and West Indies, China, Burma, Siam, South America, and the Society, Sandwich, and Samoan Islands, and from most of these places have gathered numerous converts. In 1849 the Perpetual Emigration Fund was established, to assist poor Saints in distant lands to emigrate to Utah. Annual conventions of the whole church are held, at which the whole church are held, generally at Salt Lake City, and quarterly conferences in the various 'stakes,' and usually in the various missionary fields.

Organisation.—The ecclesiastical authorities of the Church of Jesus Christ of Latter-day Saints comprises the First Presidency, the apostles, the high priests, the bishops, the priests, the deacons, and the seventy. The First Presidency, the three members, are the president, the first counselor, and the second counselor. They are assisted by the high priests, who are divided into six quorums or 'houses.' The president of the church, with two counselors, constitutes the First Presidency, the highest authority. There have been six of these presidents,—viz. Joseph Smith (martyred June 27, 1844), Brigham Young (born June 1, 1801, died August 29, 1877), John Taylor (born November 1, 1808, died in exile July 23, 1887), Wilford Woodruff (born March 1, 1807, died September 3, 1898), Lorenzo Snow (born April 3, 1814, died October 19, 1887), and Joseph F. Smith (born April 5, 1873, died April 13, 1883). The death of the president dissolves the First Presidency, the authority then devolving upon the Twelve Apostles, who nominate his successor, always selecting for the office, since the death of Joseph Smith, the president of the Apostles. The three highest in authority, when tied, constitute a First Presidency, composed of the high priests, who are divided into six quorums, each of seventy members, each council having seven presidents, included in the seventy. The seven presidents of the first council of presidents preside over all the councils of seventies. The duties of the above three bodies are general rather than local. The cities and settlements of the Saints are organised into stakes, each usually covering one county. Each stake has a president, assisted by two counsellors, also a high council of twelve, composed of high priests, and one bishop, presided over by the president of the stake and his two counsellors. Each stake is divided into several wards, president over by a bishop and his two counsellors. The high priests of any stake form a council indefinite in number. A council of elders is composed of the presidency and the high priests, 24 ; of deacons, 12. An apostle is a special witness to all the world. The Twelve Apostles are a travelling presiding high council, to build up the church and regulate the affairs of the same in all nations, as well as at home, under the direction of the First Presidency, when there is a First Presidency.
the direction of the apostles. The special office of a patriarch is to administer patriarchal blessings. Apostles, patriarchs, high priests, seventies, bishops (if high priests), and elders can preach, baptize (invariably by immersion), lay on hands for the gift of the Holy Ghost, and minister in various other ordinances of the church. Neither priests, teachers, nor deacons can lay on hands for the gift of the Holy Ghost, but a priest may preach and baptize. Neither a teacher nor a deacon can baptize or administer the sacrament, which all the other officers named may do. The special duty of a teacher is to teach the little ones in order to promote morality and faithfulness. The special duty of a deacon is to attend to minor temporary matters, and to assist the teacher in his duties.

Doctrine.—The articles of faith of the Church of Jesus Christ of Latter-day Saints: 'We believe in God, the Eternal Father, and in his Son, Jesus Christ, and in the Holy Ghost. We believe that men will be punished for their own sins, and not for Adam’s transgression. We believe that through the atonement of Christ all mankind may be saved, by obedience to the laws and ordinances of the gospel. We believe that the first article of faith is (1) faith in the Lord Jesus Christ; (2) repentance; (3) baptism by immersion for remission of sins; (4) laying on of hands for the gift of the Holy Ghost. We believe that a man must be called of God by prophecy and by the laying on of hands, by those who are in authority, to preach the gospel and administer in the ordinances thereof. We believe in the same organisation that existed in the primitive church—viz. apostles, prophets, pastors, teachers, evangelists, &c. We believe in the gifts of tongues, prophecy, revelation, visions, healings, interpreting of tongues, &c. We believe the Bible to be the word of God, as far as it is translated correctly; we also believe the Book of Mormon to be the word of God. We believe all that God has revealed, all that he does now reveal, and we believe that he will yet reveal many great and important things pertaining to the kingdom of God. We believe in the literal gathering of Israel and in the restoration of the ten tribes; that Zion will be built upon this [American] continent; that Christ will reign personally upon the earth, and that the earth will be renewed and will reach its paradisical government. We believe in the ordination of men to the several orders of the church, as apostles, prophets, priests, elders, deacons, &c. We believe in the infallibility of the leaders of the church. We believe in the Priesthood of all Men, and in doing good to all men; indeed, we follow the admonition of Paul:—'We believe all things, we hope all things, we endure all things.' We believe all things, we hope all things, we endure all things, if there is anything virtuous, lovely, or of good report or praiseworthy, we seek after these things' (Joseph Smith).

They also believed in the patriarchal order of marriage, as practised by Abraham, Jacob, and other ancient worthies; they held that it is right and proper, under certain restrictions for a man to polygamy. They believed that polygamy was a gift of God for his people, providing he is chaste and upright in his conduct and otherwise worthy of the privilege. Their marriages are 'for time and all eternity,' as they believe in the perpetuation of the family relationships hereafter. Joseph Smith held that 'all the unities of the marriage covenant, including plurality of wives.' July 12, 1843, but it was not published to the world until August 29, 1852. A woman, among the Mormons, who does not marry and bear children is regarded as not having fulfilled all the law of her own being. A defence of the system has been set up on moral grounds, as well as on the ground of revelation. They declare that prior to the advent of the Pacific railroads (which, by the way, the Mormons helped to construct), and the consequent influx of 'gentile' civilization, their community was free from the horrible vices and degrading evils that prevail elsewhere; fornication and adultery were unknown; there were no prostitutes, no vile seducers, no illegitimate children. Their wives are asserted to be happy, virtuous, and healthful, and their social and domestic purity and felicity are asserted in order to promote morality and faithfulness. The special duty of a deacon is to attend to minor temporary matters, and to assist the teacher in his duties.

MOROCCO

3142 in Great Britain. A body calling themselves the Reorganised Church of Jesus Christ of Latter-day Saints, and presided over by Joseph Smith, son of the founder of the Mormon Church, as early as 1831, and on November 25, 1832, set their headquarters are in the states of Iowa and Illinois. They claim to be the orthodox Mormons and repudiate their co-religionists of Utah, alleging that Brigham Young was a usurper, who with his associates devised plural marriage after Smith's death, and suppressed it for a time for political reasons. In 1896 Utah elected to congress a Mormon living in polygamy; but he was adjudged disqualified by congress and his seat was declared vacant.—Ed.)

The Book of Mormon has been translated into several foreign languages, as also the Doctrine and Covenants, the hymn-book, and the Voice of Warning. Besides these, the principal Mormon publications are Life of Joseph Smith, Key to theology, Spencer's Letters, Compendium of the Doctrines of the Gospel, Life of Heber C. Kimball, Autobiography of Parley P. Pratt, Story of the Book of Mormon, Catechism for Children, Snow's Poems, Harp of Zion, Correspondence of Palestine Travelers, and many minor works. See also by J. H. B. Newcomb, Early Days in the Far West (1888), and H. H. Bancroft, History of Utah (1889), with full bibliography. Twenty Mormon periodicals are published in the United States, one in England (Liverpool), two in Scandinavia, and one in Canada. To this is opposed the term of Deseret, which ranks, however, as a classical and normal school.

Morning Glory. See Convolvulus.

Morony, Charles Auguste Louis Joseph, Duc de, a French statesman, believed to have been the son of Queen Hortense and of the Comte de Flahaut, and consequently half-brother of Louis Napoleon. He was born in Paris, 25th October 1816, and was attached to the Comte de Morony. He entered the army in 1832, and served with some distinction in Algeria; but he soon abandoned a military life, and in 1838 made his début in the world of industry as a manufacturer of beet-root sugar. Ever after that time he was mixed up in all sorts of commercial and financial speculations—railway companies, canal companies, French and foreign mining companies, credit societies, and various industrial enterprises. Chosen a deputy in 1842, he quickly attained a prominent position on account of his astuteness for dealing with financial questions, and revolutionised the laws that had been attached to the cause of his half-brother, and was the leader of the subtle and treasonable policy of the Elysée. He took a prominent part in the coup d'état, and became minister of the Interior. In 1854-56, and again in 1857-65, he was president of the Gépe-Législatif, which he succeeded in reducing to subservience; and was ambassador to Russia during 1856-57, where he married the rich and handsome Princess Trubetskoi. He died 10th March 1865. The character of 'The Duc de Moron' in Daudet's 'Novels' is based on this clever and unscrupulous politician.

Moroni, Giovanni Battista, painter, was born at Albino, near Bergamo, about 1510, and was pupil of Il Mastro of Brescia (1498-1553), whose real name was Alessandro Bonvicino; both these men excelled as portrait-painters. Indeed, of the North Italians, Moroni ranks next to Titian in his class, and is considered to have lived in Lombardy the most perfect model of what modern artists call the 'true' portrait, his portraits being as perfect as any in the world. The attitudes in Moroni's pictures are easy and natural, the draperies well managed, and, the predominant tone of colour is silvery. An excellent example of his style is the 'Tullor' in the National Gallery, London, where there are also four other portraits of the same. In his house at Bergamo, he painted sacred subjects of the usual types, now, in the Beata at Milan, at Bergamo, at Verona, and other places in North Italy. He died 8th February 1578.

Morocco, or Marocco, known to the natives as Maghreb-el-Aksa, 'the farthest west,' is an empire or sultanate which, though at one time comprising a large portion of Algeria in one direction, and exercising in the other a modified jurisdiction as far as Timbuktu, is now confined to that part of north-west Africa bounded on the E. (at the Wad Kiss) by Algeria, and on the S. by Cape Nun and the Wad Draa, though both here on the Saharan side of the Atlas. The whole of the empire are rather indeterminate. Very little of the country has been even roughly surveyed; but, according to the vague knowledge possessed, it contains about 314,900 sq. m., of which the Tell or fertile region west of the Atlas contains 78,000, the Steppes, or flat, sterile upland pastures, 27,000, and the Desert or Sahara, 299,000 sq. m. Politically, Morocco comprises at present the old kingdoms of Fez and Morocco and the territories of Taflet (Tafalten) and Sus; but the two latter are almost independ- ent, recognising the sultan only as the Prince of True Believers, an office which he holds as the most powerful of the Shereefs or descendants of Mo- hammed. These four principal governments are divided into seventeen primary provinces or emirates, each presided over by a vizier, or 'bashaw,' as the Europeans call him, who again has under him various minor officials directing the affairs of the smaller districts, until the head- man of the village is reached. Many of the Arab and most of the mountain tribes are practically independent. All being governed by the Shereefian officers, and paying taxes only when an army enters their country. Over this region, living in a few moderately-sized towns, and numerous little stationary villages of stone or clay (dahars) or in the tent hamlets (houara) is wandering tribes, scattered population variously estimated from 2,500,000 to 13,000,000— the actual number being perhaps be- tween three and four millions. But there is no census, and the country-people, in order to avoid the extortion of the troops and the 'monna,' or gift of provisions to favoured travellers, pre- fer to live in retired spots at a distance from the ordinary routes through the country. Morocco is, as a rule, mountainous, the Atlas (q.v.) traversing it in several chains from south-west to north-east, and by various spurs both to the coast country and to the desert. There are, however, large barren plains, some of which are of great extent, and very rich, the soil being in many places a deep, black loam, evidently the bed of an ancient lake or of a primeval forest. There are also numerous more or less level plateaus similar to those of Algeria. But with the exception of parts of the Atlas, the forest of Manoura, the date and argan groves of the south, and a few straggling copse, the burial-places of saints, Morocco has, in the course of the last thousand years, been almost denuded of timber, the calcutta and the acacia hangnus being the most common representative of woodland. Consequently the country looks bald, rolling hills and monotonous plains, green in spring, brown during summer and autumn, being the most char- acteristic features of the north, though some of the groves and villages of the south are truly picturesque. Further south, and on the other side of the Atlas, where long droughts, followed by famines, are common calamities, and the rain- fall is at the best of times scanty and uncertain, sandy wastes are the prevailing characteristic; but often flat soil, rock and stone; sometimes thin and out of the river-valleys stony, actual desert is rare, and, except where the sand has been drifted inland by the winds, not unfitted for pasturage.
The central range of the Atlas forms the watershed separating the streams which flow into the Atlantic and Mediterra- nean from those which run southeast to the desert, many of which are lost in marshy 'sinks' or sebkhas. And of the streams flowing into the Atlantic and Mediterranean, many are in the hot season or after long droughts little better than a succession of pools connected by threads of water, though rolling in brown floods from bank to bank during the rainy season, when they are dangerous to cross. None of them are navigable for any distance from their mouths, which are always impeded by bars and shoals. Yet before the 14th century vessels of considerable tonnage went 40 miles up the Sus to Tin Mal, and one is told how the Moors used to easily navigate the Sebu to within a few hours of Fez. But there are not even barges on them.

The climate of Morocco varies much, though the western slope, being tempered by the sea-breezes and protected from the hot desert-winds by the Atlas, is temperate, the thermometer seldom falling below 40° or rising above 90°. But in summer the interior valleys are very hot, and in winter snow often falls in Fez and Mequinez, where ice an inch thick is by no means uncommon. In Tangier there has been a slight snow-shower about twice in five years. Malignant fevers are frequent. Farther south extremes of heat and drought are more common, though as a rule the climate is equable, and, unless in swampy places during summer, extremely healthy. In the Sus country and the region of Taflet rain is scarce and in places almost unknown. But farther north, and on the Atlantic and Mediterranean slopes, it falls with tolerable regularity every year between October and April, the amount being at times so great that the low lands are flooded, the rivers impassable, and the mountain-sides, unprotected by wood, furrowed by torrents, sweeping the soil and debris before them into the valleys below. On the upper reaches of the Atlas there is all summer a June-like atmosphere; but in winter they are capped deep with snow.

Morocco is thus fitted for growing any crops of the temperate and tropical zones, and under a better government would become, as Barbary was in Roman times, the granary of Europe. Wheat and barley are grown largely, and were they allowed to be freely exported would be produced in immense quantities. Maize forms the chief export of the Saharan province. Varieties of melons, almonds, lemons, and dates are among the other vegetable products. Cotton and hemp are grown for home consumption. Tobacco cultivation is prohibited and its use forbidden by the sultan, though both it and 'kof' (Indian hemp) are used. Most European fruits grow well, and among other products sugar has been raised. Cattle (under treaty arrangement with Gibraltar) are exported; but no animals can be sent out of the country without an imperial permit. The exports (mazga, beans, chick-peas, olive-oil, wool, almonds, dates, fowls, eggs, hides, bees, esparto, cattle to Gibraltar, &c.) amounted to £1,280,723 in 1887, and the imports (cotton goods, cloth, tea, coffee, sugar, candles, hardware, &c.) to £1,258,354, of which £630,245 were from Great Britain. The interior of the country is so little known that it has scarcely been visited except hastily in isolated places, that little can be said with certainty regarding its mineral wealth. But enough has been ascertained to enable us to assert that gold (placer and in quartz), copper, tin, argentiferous galena, nickel, antimony, iron, and manganese abound. Coal and petroleum have been indicated. Rich silver lodes exist at Gondi near the head-waters of the Sus, and rock-

salt is mined near Fez. But these mineral deposits are scarcely touched, and no European is allowed even to visit the mines.

The flora of Morocco is essentially European, so far as the western side of the Atlas is concerned, that of the Atlas generally being a southern extension of the temperate flora of the adjoining continent, with little or no admixture of southern types. The fauna partakes of a similar character, the Barbary fallow-deer, wild boar, Barbary monkey (found also in Gibraltar), a species of porcupine, and wild cat being the most characteristic mammals; but the lion, once common, is now very rare in the inhabited parts of the country. The birds, and fishes, and reptiles are all and ever more interesting, and the forty species of reptiles and amphibians known, twenty-two also belong to Spain; and only eight of the Moroccan species, according to Böttger, inhabit the Ethiopian region—facts all pointing to a time when the Strait of Gibraltar did not divide Europe from Africa. Ostriches are seen only in the extreme south. Locusts often devastate the country. The Barbary horses have sadly deteriorated; while in agriculture, oxen, donkeys, camels, and even women yoked with them, are commonly employed to drag the rude one-stilted plough and the harrow, which consists of a long pole with a series of large stones attached. The inhabitants consist of six principal groups. The (1) Berbers (Berber or Kelibyes, of whom the Amazigh, Sheshul, and Taureg are only branches, are the aborigines. They inhabit for the most part the mountain regions, and are still only half subdued. (2) The Arabs are descendants of the invaders who came in the 7th century. (3) The Jews were very early settlers, semi-independent colonies still subsisting in the Atlas and the Sus country, though most of them in the towns are refugees driven out of Spain and Portugal. (4) A few thousands of Europeans, chiefly Spaniards, are almost entirely confined to the coast towns. (5) The 'Moors,' a term vaguely applied to all the Mohammedan inhabitants, are really Arabs with a large admixture of Spanish and other European bloods, and the name ought properly to be restricted to the Harem. (6) The Negroes, of whom there are large numbers, were brought from the Sudan as slaves. Most of the latter are still in this condition, though the descendants of some of them now occupy high places in the army and the government. The Jews, though they are largely the offspring of former Christian adventurers, have enjoyed the protection of some 'Christian' power, prosper amazingly, and are allowed a certain autonomy in their own affairs, but are confined in the cities to a 'mellah' or Jews' quarter. In spite of many indignities, some have managed to hold offices of profit in the court.

The sultan, who is the last independent sovereign in the Barbary States (of which Tripoli is now directly under the sultan of Turkey), is one of the most perfect specimens of an absolute monarch existing. He is 'the state.' His so-called ministers are simply the favourites of the hour. Everything must pass through his hands. He receives the entire revenue, believed to be about £1,900,000 per annum, and spends as little or as much of it as he pleases. Every office is directly or indirectly purchased, small salaries or none are paid, the holders remunerating the appointer. In the whole, the system is tempered by the fact that at any moment they may be forced to disgorge to the sultan, or in default he be left to rot in the loathsome Moorish dungeons, or he beaten or tortured to death. All justice is bought and sold. Yet, owing to the religious fanaticism of the people, and the mutual jealousies of the European powers, whose representatives reside at Tangier, the political equilibrium is
preserved, and the long-expected débâcle postponed.

The only European nation which at present has any territory in Morocco is Spain, which maintains a fortress at Ceuta, and four convict settlements, and a fishing-station at Ifni. But independently of the sacred chiefs of Sus, the Grand Sheerief of Wadania Timbuktu, who has the highest position, governs that city and is lord paramount or proprietor of a large territory in the neighbourhood; where he is, or was before he became a French subject and became addicted to Frankish ways, almost as powerful as the sultan himself. He is not so entirely peremptory that the people can read or write, a capacity to repeat by heart passages of the Koran or of Al Bekkhar's commentaries on it, and the traditions being almost the sum of what is taught in the village schools. The so-called 'university' of Fez is nowadays merely a seminary attached to the chief mosque for the training of religious acolytes. Printing is still an unknown art, save amongst the Europeans of Tangier. There are no roads except bridle-paths, and no wheeled carriages in the interior. But its extensive industry besides the rude agriculture of the Berbers and Arabs, and the breeding of horses and mules, is the making of morocco, leather, harness, slippers, red 'Fez' caps, cloth for native apparel, the chiselling of brass trays, the making of rough pottery, the weaving of matting, and the weaving of carpets (principally in Rabat). The best mechanics and the jewellers are Jews.

The army has of late years been reorganised under European officers, a Scotsman (Knaid Maclean) taking the chief part in this task, so that at present there are some 15,000 men, drilled, armed, and clothed after an approach to the European fashion, the rest being mainly undisciplined native levies. Altogether, the sultan is believed to be able to mobilise upwards of 100,000 men, and double that number should the faith be in danger. There is now no army — imperial or mercantile—a single steam-transport representing the once-dreaded 'Sallee rovers.'

Morocco is connected with Spain by telegraph, and the telephone is in use in Tangier, Casablanca, and other towns of the interior. Tangier is linked by the first electric telegraph line to the Europeans. Morocco has three capitals of imperial residences, at one of which the sultan and his army reside at certain intervals and for indeterminate periods. These are Fez (q.v.), Meknès or Mequinez (q.v.), and Marrakesh, better known as the ancient city of Morocco. Beside these the principal coast towns are Tangier (20,000 to 25,000 people); Tetuan (25,000), a little way up the Martil River; Larache (El-Arish), with 10,000 people (1800 Jews and 200 Europeans); Rabat and Sallezc, on opposite sides of the Bl-Nagreb River (21,000); Casablanca, or Dar-al-Baida (8000); Mazagan (5000); Safi (8000); and Mogador (q.v.). But all of them are decaying, most of them in partial ruins, and without any exception filthy, uncleaned, and insanitary to the last degree. When not mere colonists of the interior, the Moroccans are of a nature to build with dried bricks, around a koubba or walled fortress, they are congeries of narrow intricate lanes, often covered over with vines or reeds to keep out the sun. These lanes are lined with shops which look like large packing-boxes, with the lids raised as a penthouse and a wall of whitewashed windowless walls, over which here and there rise the square towers of a mosque. But within these is often a pleasant courtyard shaded by oranges and palms and cooled by a fountain or pool. These all whitewashed rooms, furnished with the rich carpets that constitute the principal furniture of a strictly Moorish house. The sole accommodation for travellers is caravanserais, with a yard for beasts and unfurnished rooms for their owners.

After being for more than four centuries a part of the Roman empire, and in the latter period of its sway veneered with a corrupt Christianity, 'Mauri' became the name given to the inhabitants of this country, by the Arabs as well as by the most fanatical adherents of Mohammedanism. By it, and the inhabitants of the various towns, the country has been known to Europeans as 'Morocco,' a name derived from the Arabic 'Mauri,' and which is now as popular as 'Spanish' for the inhabitants of Spain, and as 'French' for the inhabitants of France.
MORPHINE

MOROPHUS, or MORPHIA, C$_7$H$_{13}$NO$_3$H$_2$O, was the first alkaloid isolated in a pure state (by Sertàrmi, an apothecary, in Hanover in 1816). The name morphia was given to it in allusion to its crystalline form (Gr. morphé, 'form'). It is the most important of the alkaloids existing in opium, of which it usually constitutes from 41th to 44th by weight, and in which it is combined with meconic, sulphuric, and probably other acids. It is obtained as white, silky, translucent crystals, with a bitter taste and alkaline reaction. Morphine is soluble in alcohol and in a mixture of boiling water: boiling alcohol dissolves it freely; but it is insoluble in pure ether and chloroform. Morphine is not so easily detected in cases of poisoning by opium as Meconic Acid (q.v. under Meconium). The following are some of the ordinary tests for it: concentrates of urine, which contain more than half the amount of its salts gives an orange colour; when it is mixed with iodic acid iodine is liberated; in solution it gives a blue colour with persalts of iron.

Morphine is the only opium alkaloid which is soluble in limo-water, and this property affords one of the best means of extracting it. A watery infusion of opium is boiled with milk of lime, filtered, mixed with powdered sal-ammoniac, and again boiled. By this means the lime is converted into the chloride of calcium, the ammonia is volatilised by the heat, while the morphine is precipitated in an impure form, which admits of easy purification. Morphine combines with acids to form crystallisable salts, which are readily soluble in water and in alcohol. Of these, the hydrochlorate (muriate), the neetate, the bimesonate, and other salts are much used in medicine. Aponorphia, a white, crystalline, bitter alkaloid, having similar properties like those of morphina, is obtained by heating morphina with an excess of hydrochloric acid.

The therapeutic uses of morphine and its salts are very similar to those of Opium (q.v.), but morphine is employed largely in cases where Hypnotism (q.v.) is not indicated. The ordinary dose of morphina, or its salts, when given to an adult to allay pain or induce sleep, ranges from an eighth of a grain to half a grain. Many persons are addicted to the habitual use of morphine. The effect is very much the same as those of opium, and it is taken for the same reasons; but morphine is more rapid in action and more efficacious, and is not accompanied by some inconveniences which attend the use of opium. The habitual abuse has its origin in the legitimate use as a medicine agent. But when the habit is established, the evil consequences soon set in, though some constitutions suffer much more than others. As a rule, habitué become pale, hollow, emaciated, appetite is diminished, digestion disordered, sleeplessness sets in, and defies extra doses of the drug. If such a habit of morphine is subcutaneously injected, all the body within reach of the syringe may become one mass of sores, so that it is hard to find a place for a new injection. The will is enfeebled; the man or woman becomes a mere paralytic. A special hospital has been established in Paris for victims of self-indulgence. See Sharpey on 'Morphinomania' in the Nineteenth Century (1887).
MORPHOLOGY

MORRIS, GOVERNEUR, an American statesman, was born in Morrisania, New York, 31st January 1792, graduated at King's (now Columbia) College in 1768, and was admitted in the United States bar in 1787. He early showed a talent for finance, and took an active share in the political affairs of the Revolution period. In May 1780 he lost a leg through a fall from his carriage in Philadelphia. From 1781 he was assistant to Robert Morris, superintendent of the national finances. In 1788 he took his seat as a delegate in the convention that framed the United States constitution, and the year after sailed for Paris, where for two years he devoted himself to private business. The greater part of this time he spent in England as a confidential agent of Washington, remaining till August 1794 as United States minister to France. Returning to America in 1798, he sat for New York in the United States senate from 1800 to 1803, and was chairman of the New York canal commissioners from 1810 till his death, 6th November 1816.

See Memoirs of Gouverneur Morris, with Selections from his Papers and Correspondence, by Jared Sparks (3 vols. Boston, 1832), and Gouverneur Morris, by Theodore Roosevelt. (1888), also The Diary and Letters of Gouverneur Morris, edited by his granddaughter, Anne Cary Morris (2 vols. 1889). The last contains many interesting glimpses of Paris in the days of the Revolution.

MORRIS, Sir Lewis, knighted in 1895, a writer of verse which has attained an extraordinary popularity, was born in Carnarvon in 1832, and educated at Sherborne School and at Jesus College, Oxford, where in 1855 he graduated first-class in classics, and won the Chancellor's prize. He was called six years later to the English bar, and practised till 1881, when he accepted the post of honorary secretary to the university of Wales. In 1877 he was elected an honorary fellow of Jesus College. Sir Lewis's first offerings of verse appeared in 1871, when under the pen-name of 'A New Writer' he published Songs of Two Worlds, which at once passed into numerous editions, and which was followed in 1874 and 1875 by a second and third volume. In 1876 appeared The Epic of Hebra, the work with which he is generally associated; it has run into several series, and these series into many editions. He has since published Gwen, a Drama; The Ode of Life; Songs Unsung; Gynia, a Tragedy; and A Vision of Saints (1890), &c., which have shown no falling off of their popularity.

MORRIS, William, the poet, was born in 1834, and educated at Marlborough and at Exeter College, Oxford, where he formed an important and lasting friendship with Burne-Jones, the famous painter. He himself studied to be a painter, but without success, his artistic temperament being destined to have play in another direction. In 1858 he published a small volume entitled The Defence of Guenevere and Other Poems, which passed almost unnoticed at the time; but in 1867 he won the attention and admiration of every true lover of poetry by a long narrative poem entitled The Life and Death of Jason. The Earthly Paradise (3 vols. 1888-70) confirmed his high reputation. This work is made up of twenty-four legendary and romantic poems of classic or of Gothic origin, recited by Norwegian seamen who had sailed westward to find the earthly paradise. In 1873, the Æneid of Virgil done into English verse (1876), Sigurd the Volsung (1876—his own favourite amongst his poems), and The Fall of the Niblung, a Poem (1877). His translation of the Odyssey (1887) is more successful than his Æneid. In collaboration with Mr Eirik Magnusson he translated from the
Icelandic Grettir the Strong, The Story of the Volungs and Niblunga, and Three Northern Love Stories. The House of the Wolfings (1899) was in prose; as was also The Roots of the Mountains (1890), a fine story of primitive Northern life, in artificially archaic language, an answer to mania
affortation to Jeanin with Juvet, Gladstone, Plain and News from Nowhere (1891)—a utopian romance—followed, and in the same year Poems by the Way, his last volume of original verse. Later were The Wood beyond the World (1895), Child Christopher (1895)—a variant of 'Havelock the Devil'—a romance.

Mortar. The capital of Morristown, New Jersey, on the Whippany River, 30 miles by rail W. of New York. It is a pleasant summer-resort, with some historic associations, and has ironworks and various mills; 3 miles to the north is a large state lunatic asylum. Pop. (1900) 11,267.

Morris, see Wallace.

Morris, Samuel Finley Breese, American artist and inventor, was the eldest son of Rev. Dr. Jedidiah Morse, geographer, and was born at Charlestown, Massachusetts, April 27, 1791. He graduated at Yale College in 1810, and visited England with the American painter Washington Allston, to study painting with him and Benjamin West. In 1813 he received a fellowship to the Adelphi Society of Arts for his first effort in sculpture, the 'Dying Herocles.' Returning to New York in 1815, he became the first president of the National Academy of Design, which was established in 1826, and filled the office till 1842, and was appointed professor of the art of design in the university of the city of New York in 1833. He did not give his entire attention to art, but devoted much study to chemistry, especially to electrical and galvanic experiments; and on a voyage from Havre to New York in 1822 he conceived the idea of a magnetic telegraph, which he exhibited to congress in 1837, and vainly attempted to patent in England. His claims to priority of invention over Professor Wheatstone in England have been the subject of considerable controversy (see Telegraph). He struggled on heroically against severe means until 1846, when at length congress, at midnight, in the last moments of the session, appropriated 30,000 dollars for an experimental telegraph line between Washington and Baltimore. Morse lived to see his system of telegraphy adopted in France, Germany, Sweden, and Russia; and even in Italy, Canada, Russia, and India. Honours both from home and abroad were heaped upon him, and an international present of 400,000 francs was given him in 1838, at the instance of Napoleon III. A bronze statue was erected to him in New York in 1871. He died in New York, 1872. See the Life by S. I. Prime (New York, 1875).

Morshansk, a town of Itusinsk, 58 miles N. of Tamboff and 149 by rail W. by N. of Penza, has distilleries and an active trade in wheat, hempseed, and tallow. It was almost burned to the ground in 1874. Pop. 21,190.

Mortality. The subject of general tables of mortality is discussed at Insurance; see also Vital Statistics. Weekly 'Hills of Mortality,' weekly reports as to christenings and burials, were first prepared by the parish clerks of London about 1592-93, in consequence of the frequent recurrence of the plague. The area within the old bills of mortality was gradually increased, till it included 1,687 acres. In 1801 the 'New Tables of Mortality' gave the registration district an area of 30,000 acres, which has also been extended to 'Registration London' had in 1871-81 an area of 75,392 acres. See London.

Mortar, a short and very thick piece of artillery of large calibre, firing a heavy shell at a fixed
MORTIMER

justifiecl permitted bomb-ships not, search Security regulated parents, by the In repaid do but Further mortgage the Koman mortgagee Scotland a deeds is the an

vessel with 50 lb. of smokeless powder and 45°
elevation, it will project a 1000-lb. shell a distance of 53 miles. The Russian artillery have a so-called field-mortar, which, being fitted with elevating gear, is best classed as a howitzer. It is 3 feet long, breech-loading, weighs only 9 cwt., and is as mobile as an ordinary field-gun. It throws a 6-inch 46-lb. shell, with an effective range to 4000 yards. Very large mortars have been tried at times, as at the siege of Antwerp cited in 1532, when the French used one of 24-inch calibres. This monster, owing to its unwieldiness and other causes, was a failure. Larger still is Mallet's 36-inch mortar, constructed in 1855, of iron parts welded together, and now in Woolwich Arsenal. Only two or three rounds have been fired from this weapon, as it showed signs of cracking after being discharged.

Mortar. See CEMENTS.

Mortar. Edgar, a Jewish boy who, on 23d June 1838, was forcibly carried off from his parents by the orders of the Archbishop of Bologna, on the plea that he had, when an infant, been baptised into Christianity by a Roman Catholic maid-servant. The manner of the boy's abduction, and the refusal of the Roman Catholic authorities to give him up to his parents, becoming known throughout Europe, excited great indignation. The boy remained in the hands of the Roman Catholic Church, and became an Augustinian monk.

Mortar-vessel, a class of gunboat for mounting sea-service mortars. Mortar-boats were a smaller kind. The most ancient form of mortar-vessel was the 'bomb-ketch,' convenient because of the length of deck without a mast. In the British naval service these several kinds of bomb-ships have ceased to exist.

Mortgage, in English law, is a contract whereby property is transferred to a creditor by way of security for money advanced. A mortgage of land is, in form, an absolute conveyance, subject to a proviso that, if the money lent is repaid within a certain time, the mortgage shall return the land to the mortgagor or borrower. Even when the time fixed has expired, equity will permit the mortgagor to redeem his property on payment of his debt; if he proves unable to do so, the mortgagee may apply to the court for a sale of the property, or for a decree of foreclosure which deprives the mortgagor of his right to redeem and transfers the property absolutely to the mortgagee. A mortgage may also, as a general rule, enter into possession of the land and draw the rents and profits; or he may sue the mortgagee for payment of the money due. Further rights may be given him by agreement, and it was formerly usual to stipulate for large powers over the property. The Conveyancing Act of 1881 now regulates the powers exercised by mortgagee and mortgagee respectively, unless in so far as its provisions are excluded by express agreement. An equitable mortgage is effected when an owner of property binds himself by memorandum or otherwise to execute a formal mortgage. A person who deposits the title-deeds of his land with a banker, as a security for money advanced, is an equitable mortgagee. Mortgage deeds do not, with certain exceptions, require Registration (q.v.). An owner who has mortgaged not unfrequently obtains further advances on the security of a second or third mortgage of the same property. A third mortgagee who buys up the first mortgage gets possession which deprives the deed is permitted to tack the first and third mortgages together: both will have to be paid off before the second. There are also cases in which a mortgagee is permitted to consolidate claims against different properties of the same debtor, requiring in all cases that the money off all or any part of the property is justified in advancing money on security of any but a first mortgage; and in every case a trustee is bound to see that the value of the property is amply sufficient to secure the amount advanced. See on this point the Trustee Act, 1888.

A mortgagee is enabled to sell the land mortgaged at a sale of the property, if the mortgagor is unable to pay principal and interest. See Coote's Law of Mortgage (5th ed. 2 vols. 1884).

In Scotland mortgages are affected by means of a Bond and Disposition in Security (see BOND). Mortgages are a higher and better form of security than in England, because of the system of registration of deeds affecting land (see SASENE); and trustees have power to invest in mortgage securities, which are considered as safe as government stock, and less liable to fluctuations of interest. In Scotland, also, the security may be mortgage lands by mere deposit of title-deeds.

In the United States the form and incidents of a mortgage are regulated by the laws of each state. Except in Louisiana, the English law seems to have been accepted on the basis of American legislation. The Homestead Laws (q.v.) enacted by several states have an important influence on the law of mortgage. See L. A. Jones, Law of Mortgages (3d ed. Boston, 1888).

Mortification, in Scotch law, is a term used to denote lands given for charitable or public uses.

Mortification, in Medicine. See GANGRENE, INFLAMMATION.

Mortimer. See EDWARD II. and III.; and for Mortimer's Cross, see HEREFORDSHIRE.
Mortlake, a parish of Surrey, on the south bank of the Thames, 2 miles ENE. of Richmond and 5 W. by S. of London. From 1619 to 1703 it was famous for its tapestry works; now malting and brewing are the leading industries. It is also a great boating-place, the Oxford and Cambridge race being rowed from Putney to Mortlake. It has a continuous line of Archbishops Anselm and Cranmer, the astrologers Dr Dee and John Partridge, Cromwell, Swift and Stella, Sir Philip Francis, Sir Richard Owen, and Sir Richard Burton. Pop. (1861) 3110; (1881) 6330. See John E. Anderson’s History of Mortlake (priv. printed, 1863).

Mortmain (Fr. morte main) signifies in law the dead land of a corporation. At an early period (1279) the English parliament took note of the mischief which resulted from the transfer of land to religious corporations; statutes were passed restricting the right of corporations generally to hold land. At the present day a corporation, whether it be a college or a railway company, cannot acquire and dispose of land, except in so far as its charter or act of parliament authorises it to do so. The statutes of mortmain were directed against corporations generally; the so-called Mortmain Acts of 1853 and 1854 made a general attack on the privilege of giving land gratis to persons in distress. The Mortmain and Charitable Uses Act, 1891, allows land to be left by will; but it must be sold within a year or other period fixed by the High Court or Charity Commissioners. Money given to purchase land, and moneys charged upon land, are within the provisions. Land situated in Scotland, in the colonies, or in foreign countries is not within the policy of the English statutes. In Scotland the common law provides somewhat similar checks on destitute charitable institutions of land; but this check has not been abolished by statute. In the United States the laws of several states limit the amount of real estate which may be held by religious bodies and charitable societies; and the laws of the United States impose a limit in the Territories.

Morton, James Douglas, Earl of, regent of Scotland, was born in the first quarter of the 16th century, the younger son of Sir David Douglas of Pittendreich, near Edinburgh. In 1553, in right of his wife Elizabeth, daughter of the third Earl of Morton, he succeeded to the title and estates of that earldom. He joined the Reformers in 1557; in 1561 was sworn a privy-councilor; and in 1563 was made Lord High Chancellor. Having borne a foremost part in Rizzio's assassination (1566), he fled with his associates to England, but, through Bothwell's interest, in eight months obtained his pardon from the queen. He was privy to the design for Darnley's murder, but was purposely absent from Edinburgh on the night of the tragedy (1567); and, on Bothwell's abduction of Mary, he joined the confederacy of the nobles against them. He figured prominently at Carberry Hill; discovered the 'Casket Letters;' led the van at Langside (1568); and, after the brief regencies of Moray, Lennox, and Mar, in November 1572 was himself elected regent. His whole policy was directed in favour of Elizabeth, from whom in 1571 he was receiving bribes; and his high-handed treatment alike of the nobles and of the Presbyterian clergy, his attempts to restore episcopacy, and the avarine and rapacious character proper to him, finally swelled the number of his enemies, who already included all Mary's adherents. He seemed to have retrieved his temporary downfall by the seizure two months later of Stirling Castle (May 1578); but Esmé Stuart in 1580 completely supplanted him in young King James's favour; and on 26 June 1581, 'as art and part' in Darnley's murder, he was beheaded with his own 'Maiden' in the Edinburgh Grassmarket. 'He died proudly, said his enemies, and Roman-like, as he had lived; constantly, humbly, and Christian-like, said the pastors who were beholders.'

See Douglas, Mary Queen of Scots, and James VI., with works there cited; also Mr. T. F. Henderson's article in vol. xv. of the Dict. of Nat. Biog. (1888).

Morton, John, Cardinal, and Archbishop of Canterbury, was born at Milbourne St. Andrew, in Dorsetshire, about 1420, studied at Cerne Abbey and Balliol College, and practised as advocate in the Court of Chancery of Charles VI. His political preferences and a member of Privy-council, he suffered with great fidelity to Henry VI., yet by Edward IV. was made Master of the Rolls and Bishop of Ely. Richard III. imprisoned him, but he escaped, and joining Henry VII. was by him made Archbishop of Canterbury and chancellor (1486). In 1493 he became a cardinal; and he died 15th September 1500. Sir Thomas More was a page in his house. See Hook's Lives of the Archbishops (1867), and Gairdner's Henry VII. (1889).

Morton, Leid Parson, vice-president of the United States, was born at Shurehan, Vermont, 28th May 1762. He was of a long, but an inferior, line of ministers. He graduated assistant, then partner in a Boston firm of merchants, and in 1802 founded banking-houses in New York and London. In 1788 and 1810 he was returned to congress as a Republican; in 1818-1813 he was minister to France; and in 1883 he was elected vice-president of the United States.

Morton, Samuel George, an American physician, was born at Philadelphia, January 26, 1779, studied medicine there and at Edinburgh, and in 1803 was appointed professor of Anatomy in the Pennsylvania Medical College. He died May 15, 1851. Morton may be regarded as the first American who endeavoured to place the doctrine of the original diversity of mankind on a scientific basis. His great works are Crania Americana (1839) and Crania Egyptiaca (4 vols. 1844); and his museum of comparative entomology, preserved at Phila- delphia, contains some 1500 skulls—900 of them human.

Morton, Thomas, dramatist, was born in 1764 in the county of Durham, but, left an orphan, was brought up by an uncle in London. He entered Lincoln's Inn, but soon quitted law for play-writing, and produced Speed the Plough (1798, with its invisible 'Mrs Grundy'), The Blind Girl (1801), Tom between Country and Town (1807), School for Gather Chil- dren (1828), &c. For thirty-five years he lived at Pungbourne, near Reading, till in 1828 he removed to London, where he died, 28th March 1838. His son, John Madison Morton, the author of Box and Cox, was born at Pungbourne, 3d January 1811, and was educated in Paris and Germany (1817-20), and then at Clapham under Dr Richardson (1820-27). From 1832 to 1840 he held a clerkship in Chelsea Hospital, and between 1853 and 1858 wrote close on a hundred farces, of which Box and Cox (1847) alone is said to have brought him £7000. In 1858 he was sent to New York; but in 1881 he became a "poor brother" of the Charter- house. He died December 19, 1891. See memoir by Clement Scott prefixed to Plays for Home Performance (1889).

Morvan, le, a barren district of France, a north-easterly extension of the central plateau (see France, Vol. IV, p. 770), is mainly in the department of Nièvre (q.v.).

Morvern, a peninsula of north-west Argyll- shire, between Lochs Sunart and Linnie. It is the 'Highland parish' of Norman Macleod.
MORWENSTOW, or MOORWENSTOW, a parish in the extreme north of the Cornish coast, 7 miles N. of Bodie; pop. 810. Its church, dedicated to St Morwenna, is mainly of Norman date; R. S. Hawker (q.v.) was its vicar.
